*The New Economic Policy.*—During the period of war communism, levies of food in kind had increased the general dislocation of production. Under the N.E.P., a decree was issued by the Soviet Govt. on March 21 1921 introducing a tax in kind, graded according to the extent of the sown area and the livestock in each holding, the assessment to be made with the assistance of local peasant committees. The total food tax in Great Russia (the R.S.F.S.R.) was fixed at 240,000,000 poods of grain. A year later (May 22 1922) a new Agrarian Code laid down exact regulations on the terms on which land may be held, the forms of land tenure and the machinery for distribution, the conditions of labour and the legal rights of the peasant household, the movement of rural populations and the regulation of disputes (see the Agrarian Code of the R.S.F.S.R., Moscow,

1923, in Russian); see also the *Report on Economic Conditions in Russia* (1922) of the League of Nations.

The Agrarian Code introduced two fundamental changes. It permitted the letting of land on a cultivating lease to a tenant who can cultivate the holding by the labour of himself and his family for a maximum period of six years. A peasant may let his whole farm under certain emergency conditions. Part III. of the Agrarian Code also sanctioned the employment of "auxiliary" labour on farms. This, however, was subject to numerous restrictions. Further, the Agrarian Code contained no details as to the rent conditions of the employment of paid workers, and could be interpreted in a very arbitrary manner.

A Decree of the Council of People's Commissaires of the Soviet Union dated April 18 1925 and entitled Provisional Rules for the Employment of Auxiliary Labour in Agriculture completes the Agrarian Code and determines its interpretation. Under the decree in certain circumstances, by agreement between the parties, hours of work per day may exceed eight, the wages paid may not be less than the official minimum wage, wages may only be paid in kind if the wage earner consents to it, the employer is to find suitable accommodation for the worker; if the employer has at least three wage-earners, he must insure them with an insurance fund which will cover all his risks. The most striking feature in this decree is that the Government has now almost without reserve authorised the employment of paid work in agriculture, and is endeavouring to fix certain rules for this employment. These two points institute a radical change in Soviet policy.

The Code provisions for land settlement proceeded on traditional lines with the object of improving the position of the communities. In the years that followed the settlement of small villages and of individual settlements went on side by side. Where the land is rich and the water supply good, as in the Ukraine and White Russia, individual homesteads have been increased although tenure by the community is still the rule; in the Volga districts village settlement is the rule; the tendency to collective cultivation is stronger in the central industrial districts than elsewhere, though here agriculture is usually a part-time employment. In some districts, where the holdings were remote from the village, new villages have been established in a better position. To facilitate land reorganisation the Russian and the Ukraine Agricultural Banks issue loans to individual peasants and collective farms.

*The Single Tax.*—The Agrarian Code was followed by the regulations for the collection of the food tax. With the option to pay in money the amount of the tax collected in kind decreased, and in 1924 money payment entirely superseded collection in kind.

For a full list of the various publications on Russian agriculture and Russian land settlement, see M. Tcherkinsky, "Agrarian Policy in Soviet Russia," in *International Review of Agricultural Economics* (Rome, Oct.-Dec. 1924). (J. H. Go.)

## VII. RUSSIA'S FOREIGN DEBTS

*Foreign Debt Before the War.*—An estimate made by the Bankers' Trust Company of New York<sup>1</sup> places the national debt of Russia on Jan. 1 1914, for which the State was directly or indirectly (by State guarantee) responsible, at \$6,568,000,000, of which probably from 44 to 50% was in foreign holdings. Of the total interest, about \$199,000,000, paid annually on the external part of this debt—62-79% was remitted to France, 7-75% to Great Britain, 11-63% to Holland and the remainder to other countries. Thus France was by far the most considerable creditor. Of the gross total \$4,541,000,000 was direct debt, 63% of which had been incurred for the general needs of the State, especially for military expenditure, and the remainder for railroad construction. The latter charge may be taken as partly a defence measure, since the railways were largely strategic. The guaranteed debt amounts to \$2,026,506,000; the State, having guaranteed issues made by the railroads themselves amounting to \$965,816,000, undertook in 1913 a further liability as guarantor for \$423,912,000 bonds for the Nobles Land Bank and for \$636,838,000 bonds of the Peasants Land Bank.

Since the national wealth of Russia before the War was estimated at \$8,400 million dollars—approximately equal to that of France—

the direct debt of the State, 4,541 million dollars, was not excessive when compared with that of France, but the large percentage held abroad made Russia's debt potentially a much heavier burden. Up to 1917 payments were punctually made.

*War Debts.*—During the War large commitments were incurred to the principal Allies, especially to Great Britain, France and the United States, as follows: Great Britain, \$2,766,000,000; France, \$762,000,000; United States, \$279,000,000; making, with advances from Italy and Japan, a total of \$3,969,000,000. This external war debt was principally incurred for financing the purchase of war materials in Allied countries, though there was not necessarily a direct correspondence between the obligations incurred in any one country and the purchases made there. Great Britain, in fact, acted as an intermediary in the balance of accounts. The details of the credits advanced to Russia were discussed at successive Allied Conferences, notably at Paris (Feb. 1915), London and Boulogne (Sept. 1915) and London (July 1916), under which Russia obtained the credits indicated. In connection with the arrangements made by the Russian Finance Minister, M. Bark, with Great Britain<sup>2</sup> certain shipments of gold were made to Great Britain, amounting in all to \$292,000,000 in addition to a purchase of gold of \$39,000,000 made by the British Government against credit in Oct. 1914. The last gold shipment was made in Feb. 1917 on the eve of the revolution. These shipments, except for the first delivered in Liverpool, were made from Vladivostok to Japan and Canada on account of the submarine danger. In the United States Russia opened certain credits in New York through a syndicate of banks during the early part of the War. After the entry of the United States into the War, the American Govt. opened a credit of \$325,000,000 on Russian behalf. By Nov. rather more than half of this credit had been exhausted, and the issue of credits ceased with the Bolshevik revolution in that month.

*Commercial Investments in Russia.*—Russia entered the world market principally as a grain exporter, and it is by her grain exports that Russia has continued to finance her need for extensive credits abroad. These needs have been, and are, conditioned mainly by the huge area and the need of communications in sparsely populated and undeveloped districts, and by the impossibility of developing the immense mineral wealth of the country with Russian capital. Railway and municipal investment has already been mentioned. The following estimate of the distribution of foreign pre-War investments in Russian commercial enterprises was made by the Soviet Govt. in 1922. The largest amount was invested in mining and cognate industries; then, in order of importance, real estate, banking and the textile industries.

### Geographical Distribution of Foreign Pre-War Investments in Russian Commercial Enterprises

(In "currency" dollars—000,000 omitted).

|                       | Amount  | %     |
|-----------------------|---------|-------|
| France                | \$377   | 32.6  |
| Great Britain         | 261     | 22.6  |
| Germany               | 227     | 19.7  |
| Belgium               | 165     | 14.3  |
| United States         | 61      | 5.2   |
| Holland               | 19      | 1.6   |
| Switzerland           | 17      | 1.5   |
| Sweden                | 12      | 1.1   |
| Denmark               | 8       | 0.7   |
| Austria               | 4       | 0.4   |
| Italy                 | 1       | 0.1   |
| Norway                | 1       | 0.1   |
| Finland               | 1       | 0.1   |
| Total Soviet Estimate | \$1,154 | 100.0 |

<sup>2</sup> "A consideration received by Russia (under the 1915 agreement) was an arrangement by which the British Govt. agreed to open in favour of Russia a non-negotiable credit for \$973,000,000, which appeared on the balance sheet of the Bank of the State as 'gold abroad' and afforded a basis for the issuance of bank notes in Russia. This plan was made effective in the following manner—Great Britain made an exchange of obligations with the Russian Govt., the Russian Govt. depositing with the British Treasury non-interest bearing Russian Treasury bonds, while the British Govt. gave in exchange intangible credits. This arrangement was to expire not later than one year after the conclusion of peace, when these obligations of equal value of both parties were to be redeemed. Thanks to this arrangement, which was pure camouflage, in banking parlance 'kiting,' the decrease in the gold stock resulting from the exportation of the gold was not perceived by the public at large. Indeed, the decrease of specie under the heading of 'gold coin, ingots and vouchers of mines' was more than compensated by the increase in the quantity of specie under the heading of 'gold abroad.' This was one of the financial secrets of the War, which only came to light after the fall of the Tsarist Govt."—*The Inter-Ally Debts*, pp. 137-8.

Classification by Industries of Pre-War Investments in  
Russian Commercial Enterprises

(In "currency" dollars—000,000 omitted)

|                                       | Amount  | %     |
|---------------------------------------|---------|-------|
| Mining . . . . .                      | \$429   | 37.2  |
| Metallurgy . . . . .                  | 202     | 17.5  |
| Real Estate . . . . .                 | 134     | 11.5  |
| Banks . . . . .                       | 122     | 10.6  |
| Textile Industries . . . . .          | 99      | 8.6   |
| Chemical Industries . . . . .         | 43      | 3.7   |
| Commercial Industries . . . . .       | 42      | 3.7   |
| Manufacturing of Foodstuffs . . . . . | 19      | 1.7   |
| Printing . . . . .                    | 16      | 1.4   |
| Shipping . . . . .                    | 14      | 1.2   |
| Lumber Industry . . . . .             | 13      | 1.1   |
| Mineral Exploitations . . . . .       | 9       | 0.8   |
| Animal Products . . . . .             | 7       | 0.6   |
| Insurance . . . . .                   | 5       | 0.4   |
|                                       | \$1,154 | 100.0 |

French capital was dominant in the metallurgical, locomotive and shipbuilding industries; English capital was principally invested in the petroleum, copper, thread and tobacco industries; Belgian interests were extremely various; and American investments were mainly through insurance companies. Though Germany came third on the list of investors, her financial and industrial influence was by far the most important because of the direct participation of German banking interests in Russian industry, and of the number of Germans engaged in the management of finance. German permeation succeeded because of direct and personal contact.

**Repudiation.**—On Feb. 8 1918 the Soviet Govt. issued a decree repudiating the State internal loans, the guarantees given to various concerns and foreign loans. Certain modifications were declared with regard to internal indebtedness, but the repudiation of the foreign obligations of the State was absolute. It may be pointed out here that in any apportionment of Russian debt under post-War conditions, a certain proportion, especially of the guaranteed debt for railway construction and municipal enterprise, harbours, etc. would fall on Poland, the Succession States on the Baltic and Rumania.

**Debt Negotiations.**—Although the Soviet Govt. repudiated the debt of their predecessors, they came to realise that foreign capital was essential if the devastation of war, revolution, famine and civil war was to be repaired. In 1919 a tentative suggestion of the general settlement which the Soviet Govt. were prepared to accept was telegraphed from Helsingfors to the American Delegation in Paris. It included, subject to the acceptance of the existing position in Russia, the raising of the blockade, a general amnesty and the restoration of diplomatic relations, an offer to recognise the responsibility of the financial obligations of the former Russian Empire to foreign States parties to the Agreement. The offer was subject to a time limit (April 10), and lapsed. In the Anglo-Russian trade agreement of March 16 1921 the Soviet Govt. recognised its obligation to compensate private citizens to whom payment for goods and services is due.

In the proposals for a European economic conference which preceded the Genoa conference (*See* GENOA, CONFERENCE OF), the fundamental conditions of success laid down by the principal Allied Powers included the statement that governments desiring foreign credit must "recognise all public debts and obligations which have been or may be undertaken or guaranteed by the State, by municipalities, or by other public bodies, as well as the obligation to restore or compensate for loss or damage caused to them when property has been confiscated or withheld."

The Genoa conference failed. In the Rapallo Treaty signed with Germany there was a mutual shelving of public claims, subject to the reservation that in the event of a debt settlement with other countries Germany might claim equivalent advantages. At Genoa and at the subsequent conference at The Hague a formula might probably have been reached on the pre-War Tsarist debt, given *de jure* recognition by the Powers concerned of the Soviet Govt., as the writing down of war debts was a foregone conclusion; the failure came nominally on the question of compensation to former owners of nationalised property.

In the draft treaty between Great Britain and Russia signed on Aug. 8 1924, but never ratified, the Soviet Govt. recognised the claims of British holders of Russian State and guaranteed loans "other than holdings acquired by purchase since March 16 1921 and were in other than British ownership at that date." The actual settlement was to be by negotiation between the parties concerned, but the British Govt. had to be assured that the terms were accepted by the holders of at least one-half of the capital value of the loans. The whole of the war debts and claims were reserved for future discussion, including the gold transferred to London, and the gold handed to Germany after Brest-Litovsk. The financial settlement was subject to the floating of a Russian loan on the London market. After the failure to secure ratification conversations were not re-

newed. Steps were, however, taken by the Russian Govt. to initiate conversations in Paris.

There seems to be no reason to suppose that, given an improvement in Russian trade, Russia would not be economically able to renew payments of interest on her pre-War loans, subject to certain necessary adjustments. The question of war debts, as other inter-allied negotiations have shown, is another matter (*see* INTER-ALLIED DEBT).

(H. E. F.)

**RUSSIA, CAMPAIGN IN.**—The campaign in north Russia continued long after the signing of the Armistice in 1918. It must not be regarded as an isolated incident of the World War, but as a definite part of the Allies' plan for the defeat of the Central Powers, and although the direction of the operations was entrusted to the British authorities the campaign was international. Contingents were sent from Great Britain, the United States, France, Italy and Serbia, whilst detachments were also formed from Polish, Finn, Czech, Russian and Chinese refugees.

**Position after the Russian Revolution.**—The revolution in Russia had brought about the collapse of the Eastern Front, and the separate peace concluded between Germany and the Soviet Govt. in 1917 had enabled the Germans to transfer large forces from east to west, thereby rendering the position of the Allies in France most difficult. The future attitude of the Soviet Govt. towards the remaining combatants being uncertain, it was felt by the Allies that the building up of even a portion of the old Russian front might prevent further transfers of German troops to the west. An Allied contingent in north Russia might certainly hope to obtain assistance from all Russian elements dissatisfied with the Soviet rule and the great stores of war material accumulated at Murmansk and Archangel would be saved from falling eventually into the hands of the Germans.

**Allied Expeditionary Force.**—The original force consisted of 150 British marines who landed at Murmansk in April 1918. They were followed by 370 more at the end of May, with a further reinforcement of infantry and machine-gunners to the number of 600 on June 23. The strength of the forces gradually grew until the maximum strengths reached by the main contingents were as follows: White Russians, 20,000; British, 18,400; United States, 5,100; French, 1,800; Italian, 1,200; Serbian, 1,000.

Maj.-Gen. F. C. Poole, the commander-in-chief of the Allied forces in north Russia, arrived at Murmansk on May 24 1918 and found that the Allies were holding the Kola Peninsula with detachments at Kandalaksha. He pushed southwards down the Petrograd railway, and by the end of June had secured Kem and Soroka, the point where the road to Archangel *via* Onega branches eastwards. The ice-free port of Murmansk was thus fully protected against any possible raid by the German forces in Finland and the stores on the quays rendered secure. There could now be no chance of German submarines being sent up by rail for employment against the Allied shipping from a new and dangerously situated base.

Poole then turned his attention to Archangel. Leaving the Murmansk area in charge of Maj.-Gen. C. M. Maynard, he occupied the port on Aug. 3 with a force of 1,500 men under Brig. Gen. R. G. Finlayson, supported by British and French warships and a force of Serbs and Russians under Col. Thornhill moving overland *via* Soroka and Onega. The Bolshevik Govt. in Archangel was overthrown by the local inhabitants and replaced by a Provisional Govt. under M. Tchaikovsky. Columns were at once pushed out to the south to secure adequate protection. Onega, Obozerskaya on the Vologda railway, Bereznik, at the junction of the rivers Dvina and Vaga, and Pinega were occupied in turn. The safety of the port and the town with its many refugees was thus assured.

Although the Bolsheviks had evacuated the town of Archangel hurriedly, they offered an obstinate resistance to Finlayson's troops fighting for elbow-room. Conditions of great heat, myriads of mosquitoes and bottomless bogs in the deep forests followed one another as summer turned to autumn, and by the end of Oct. tropical rains had rendered all movement except

by water impossible. Operations had perforce to stop until the coming of the snow. Transport vehicles and river vessels had to be collected in great haste and manned by available volunteers. The difficulties of language were often acute, for in addition to the several tongues of the Allies there was the main language, Russian, to be considered and none of the contingents were anything but poorly equipped with Russian interpreters. Early in Oct. 1918 Gen. Poole proceeded to England, and in Nov. Maj.-Gen. W. E. Ironside, who had been chief general staff officer in north Russia, was appointed to succeed him. The commands of Archangel and Murmansk were then made independent of one another.

The question of the maintenance of the Allied forces in north Russia had been early considered by the authorities. Murmansk, being an ice-free port, could be used all the year round, and the troops based upon it could be withdrawn at any time. But with Archangel the case was different. The port becomes frozen up from early Nov. till late April of each winter, access being at all times difficult and often impossible even with the help of modern ice-breakers. The War in France had not yet come to an end in Oct. 1918, nor could it be said with certainty that it would cease before the spring of 1919. It was of the utmost importance to prevent the resources of Russia becoming available to the Germans, should they be able to continue fighting throughout 1919. The decision was therefore made to remain at Archangel during the winter.

The expedition to north Russia in the summer and autumn of 1918 undoubtedly did much to complicate the plans of the Germans, who feared an overthrow of the Soviet Govt. and a general reconstruction of the Eastern Front. There is definite evidence that the German military authorities were unable to continue the transference of troops from east to west in the final stages of the War, despite the urgent demands of Hindenburg and Ludendorff. The original object of the expedition was therefore fully achieved.

*Peculiar Difficulties of the Campaign.*—The winter campaign in north Russia may well be termed unique in the history of war. Never before had troops been called upon to fight under such severe climatic conditions. The Armistice in Europe also, coming as it did just at the closing of the White Sea with ice, could not be acclaimed joyfully as it was on other fronts. For the north Russian force a new campaign was beginning, and all knew that relief could not come for at least six months. The feeling that demobilisation was being carried out on all other fronts had a demoralising effect upon all ranks of the force. Furthermore, the object of the campaign was obviously no longer the same. Germany as an enemy had disappeared from the scene, and the Allied troops were never again quite clear as to the reasons for the continuance of the fighting. In their efforts to reconstruct the Eastern Front, the Allies had espoused the cause of the White Russians and had called upon the Czech ex-prisoner of war units in Siberia to march westwards to join them. In this action they had come into conflict with the Soviet Govt. and they could not now abandon the White Russians who had joined them in the campaign. It was thus that the Bolsheviks became the new adversaries of the Allies.

For the British authorities the campaign was a serious responsibility. Food, clothing and munitions had to be unified as far as possible for the simplifying of supply. Each contingent required special items in its ration—rum for the British, wine for the French, coffee for the United States troops, onions for the Italians and a double ration of bread for the Russians. The town of Archangel contained at least three times its normal population owing to the influx of refugees, and it was impossible to let the population starve. Large supplies had to be imported for this purpose.

*Winter of 1918-9.*—The transition stage from summer to winter proved a difficult period for the Allies. The freezing of the Dvina came unusually late in Nov. 1918 and the Allied gunboats were withdrawn too soon for wintering in Archangel. The Bolshevik gunboats were thus enabled to descend the river from their more closely situated winter quarters and bombarded the Allied

positions with their long-range guns with impunity. Many casualties were caused and much damage was done to the carefully prepared winter quarters of the troops. The situation was at one time critical, British and Americans, supported by Canadian artillery, fighting desperately to maintain their positions.

At Archangel during the winter the attitude of the Allies was purely defensive, covering the mobilisation and training of the new troops of the North Russian Provisional Government. In the Murmansk area their task was to maintain a perpetual threat towards Petrograd and to divert as much of the Bolshevik forces as possible from Archangel. Fighting continued throughout the winter in both areas at irregular intervals, the enemy becoming steadily more efficient and exerting greater and greater pressure on the Allied columns. The intense cold and the continual darkness tried even the stoutest heart. Exposure after a wound meant certain death, and to touch metal with the bare flesh was to brand oneself as with a red-hot iron. The curious noises in the forest in intense cold made sentry duty most trying. Machine guns could only be used in warmed blockhouses, the field of fire of which might be destroyed in a night by a heavy fall of snow. Flying conditions were intolerable, even with electrically heated clothing. Aerodromes were only made possible for starting and landing by marching whole battalions over the snow. Only the strictest discipline could save the troops from heavy casualties through frostbite and sickness.

The war-worn Allied troops may well be proud of their efforts during this critical winter. All the main Archangel positions were maintained intact against the repeated attacks of a superior enemy. In May 1919, when the frost broke, the forces of the Provisional Government had been raised in numbers to 20,000 men of all arms, properly clothed, equipped and organised. In the Murmansk area, Gen. Maynard's troops had succeeded in seizing the northern end of Lake Onega, thus making their threat against Petrograd an effective one, and containing a considerable force of active Bolshevik forces.

*Arrival of Relieving Force.*—The general thaw commenced in the first week of May, and by the 12th the river was free of ice. Two relief brigades under Brig.-Gens. Grogan and Sadleir-Jackson arrived at Archangel on May 26 and June 10 respectively, having had to force their way through the pack-ice of the White Sea. Evacuation of all troops which had spent the winter in north Russia commenced at once.

*Evacuation of North Russia.*—The evacuation of all Allied personnel from north Russia before the arrival of winter in 1919 having been ordered, preparations for this were at once begun. The old contingents were embarked in turn, the British being the last to leave. Then followed those elements of the population which had elected to leave the country. In all, some 17,000 persons were transported from north Russia in British ships at a time when shipping had been much reduced through the German submarine campaign. By the end of July nothing remained but the fighting troops of the relief force and a few necessary administrative services.

It had been hoped to make a junction with Adm. Kolchak's troops advancing from Siberia, but the defeat of the Siberians made this impossible. Nothing remained but to disengage the British troops from their advanced positions with a view to leaving the local Russian troops in the best defensive positions possible. A gradual substitution of Russian for British troops and administration was therefore commenced, the process being accompanied by several outbreaks of mutiny amongst the new troops. The fronts of the various columns were cleared by vigorous action on the part of Brig.-Gens. Graham and Sadleir-Jackson, ably supported by the naval flotilla under Capt. Altham. By Aug. 10 the Russian commanders were handed over a satisfactory situation, and the withdrawal of the British troops to the inner defences of Archangel commenced.

Gen. Lord Rawlinson arrived at Archangel on Aug. 12 and approved of the plans already arranged. Withdrawal continued without a hitch, and on Sept. 27 the last 5,000 men were embarked simultaneously from 13 different points and the evacuation of Archangel was complete. The long withdrawal in the

Murmansk area was then completed under the direction of Brig.-Gen. H. C. Jackson, who had replaced Gen. Maynard on Sept. 20 owing to the latter's illness, the last man leaving the port on Oct. 12.

**RUSSIA IN ASIA** (see 2.741).—The greater part of the Asiatic possessions of the former Russian Empire were incorporated under the Soviet system in the Russian Socialist Federated Soviet Republic (R.S.F.S.R.), which is a constituent State of the Union of Socialist Soviet Republics (U.S.S.R.). These territories are divided into Siberia and the Far Eastern Province, which are directly under the Moscow Govt. and the autonomous Socialist-Soviet Republics of Yakutsk, Mongol-Buryats and Qirghizstan, which enjoy considerable local autonomy under the general direction of the R.S.F.S.R. The country known as Russian Turkestan consists of two independent Socialist Soviet Republics, Turkomanistan and Uzbekistan, which are constituent States of the U.S.S.R. (See SIBERIA; TURKESTAN.)

**RUSSIAN LITERATURE**<sup>1</sup> (see 23.914).—The death, in 1910, of Tolstoy, is not a landmark of Russian literary history. Ever since his conversion he had, as it were, passed out of time into eternity, and ceased to fit into the scheme of literary values. The publication of his posthumous work (three vol. 1911, and a fourth 1926) in spite of its immense intrinsic significance, stands outside the current of history. But the influence of Tolstoy, especially that of his later work, *Ivan Ilyich* (1891, Eng. trans. 1895); and *Master and Man* (1895, Eng. trans. 1895), is very apparent on the one hand in the problem stories of Andreyev, Bunin, Artsybashev and Sergeyev-Tsensky; on the other, in the philosophical writings of Shestov.

*The Realists.*—The traditions of the older realistic school were continued into the 20th century by numerous writers of the older generation, none of whom are of importance, except Vladimir Korolenko (1853-1921). His autobiography *The History of My Contemporary* (five vol. 1909-22) is his longest and one of his best works.

At the end of the 19th century the realistic narrative form had been reformed and renewed by Anton Chekhov and about the same time a group of young writers came forward, whose work, realistic like that of the older tradition, but cruder and less reticent, produced the impression of a literary renaissance. Its chief exponent was Maxim Gorky (b. 1869), whose early work (1895-1901) took the Russian and foreign reader by storm and was one of the greatest booms of the European book market. It was inspired by a semi-romantic spirit of freedom and revolt, which in conjunction with an audacious realistic style was what made for its success in Russia. After 1900 Gorky became absorbed in politics. His work of 1904-12 is tendentious and revolutionary. It marks a distinct decline and coincided with an eclipse of his popularity.

But in 1913 Gorky published *My Childhood* (Eng. trans. 1915), the first volume of an autobiography, which revealed him once more as a powerful and, this time, quite unromantic realist. It was followed by two more autobiographical volumes *Among Strangers* (1915) and *My Universities* (1922), a volume of *Recollections* (1924) and *Fragments from my Diary* (Eng. trans. 1924). These books are objective, dispassionate, unsweetened paintings of Russian life. The author is present in them only in so far as he sees with his eyes and selects out of his store of vision. His attitude may be described as a fascinated disgust at the ugliness of Russian life, and an equally fascinated attraction towards all the great, the good and the original, that stands out in bold relief against the drab and joyless background. The volume of *Recol-*

*lections* contains a memoir of Tolstoy which is one of the best things ever written of that great man.

Of the other writers who gathered about 1900 round Chekhov and Gorky the most famous is Leonid Andreyev (1871-1919). His best stories are in the tradition of Tolstoy's *Death of Ivan Ilyich* and *The Kreutzer Sonata*. *Once Upon a Time There Lived* (1901); *In the Fog* (1902); *The Governor* (1906, Eng. trans., 1921); *The Seven Who Were Hanged* (1908, Eng. trans., 1909) are problem stories of death and sex written in a sober realistic style. But Andreyev early succumbed to the lure of a cheap and rhetorical "modernism" and his style degenerated into a tedious succession of gaudy and insincere clichés (*The Red Laugh*, 1904, etc., Eng. trans., 1905). The main theme of Andreyev is the vanity of life and of all earthly things and the "craving void" of man before the elemental forces of death and madness. More artistic and more traditional than Andreyev's is the work of Ivan Bunin (b. 1870), a disciple of Turgenyev and of Goncharov, as much as of the older Tolstoy. A sense of the vanity of all earthly values in the presence of nature and death is as apparent in Bunin as in Andreyev. But it is diluted by his sentimental attachment to the decaying life of the provincial gentry. Bunin's most important works are *The Village* (1910, Eng. trans., 1923), and especially *Sukhodol* (1912), which, together, give an impressively gloomy picture of the spiritual decay and cultural poverty of the Russian peasantry and provincial gentry. They are among the most terrible pieces of special pleading against the whole of Russian life ever written.

A more detached and less local style is that of *The Gentleman from San Francisco* (1915, Eng. trans., 1922), a story, in the Tolstoyan tradition, of the vanity of the things of this earth before the face of death. The same theme of vanity and emptiness moves many other writers of this group, among whom the best known is Michael Artsybashev (b. 1878). In his drearily didactic novel *Savin* (1907, Eng. trans., 1915), he preached, in a style unintelligently aped from Tolstoy, the gospel of complete submission to sexual impulses. More significant and sincere are his stories of death: *The Death of Lande* (1904, Eng. trans., 1915); *Breaking Point* (1911-2, Eng. trans., 1915). On the whole Artsybashev is a very inferior writer, but he is representative of the devastated generation of Russian intellectuals who had lost their old revolutionary faith and acquired none instead. More significant is the work of S. Sergeyev-Tsensky (b. 1876), a writer of real originality and, unlike the foregoing, the master of an individual style. The theme is again death and the vanity of life, but it is treated with greater sincerity and imaginative power. The masterpiece of his early period *Movements* (1910) is one of the most powerful stories of dying after *The Death of Ivan Ilyich*. Since then he has struck a more optimistic note, but he has also lost much of his power over words (*The Inclined Elena*, 1914, *Transfiguration*, 1923).

Of the other writers belonging to the "realistic party" Alexander Kuprin (b. 1870) acquired great popularity by his novel of army life published during the Japanese War (*The Duel*, 1905, Eng. trans., 1916), and by the cheaply realistic and journalistic brothel story *Yama* (1913). But in his shorter stories he has shown himself an excellent master of simple and forcible narrative of a kind that is rare in Russia and which recalls Kipling.

Other "realists" are Semen Yushkevich (b. 1868), stories of Jewish life, especially *The Adventures of Leon Drey*; Ivan Shmelev (b. 1875), *The Waiter* (1912), *That Which Happened* (1921, Eng. trans., 1926), one of the best war stories in Russian; V. Ropshin (pseudonym of the terrorist and politician Boris Savinkev 1879-1925), *The Pale Horse* (1909, Eng. trans., 1915) largely autobiographical, a powerful revelation of the terrorist mentality, and *The Black Horse* (1924), a story of the Civil War; Boris Zaytsev (b. 1881), stories of "atmosphere," which become almost flabby in their tendency, often present in Russian fiction, to do without skeleton or outline; and the humorist Teffi (pseud. of Mme. Buchinsky).

*The Mystics.*—While the "realists" occupied the front of the literary stage, a movement was going on that was to transform the appearance of Russian literature. It is difficult to define it

<sup>1</sup> In this article the titles of all works have, for the convenience of the reader, been translated into English, although the books themselves may not have been so treated. When, however, they have been translated the date of the publication of the translation is, as far as possible, given.

in a word. Those who did not belong to it called it "modernism." It included a great variety of currents, but they all have this in common, that they brought forward precisely those cultural and spiritual values that had been neglected by the "intelligentsia" civilisation of the 19th century. In terms of personality it was largely an assertion of the spirit of Dostoevsky as against that of Tolstoy. It was also a victory of mystical and metaphysical religion over ethics, and of aesthetics over politics. In its first stages it brought with it a great wave of new foreign influences; Ibsen, Wilde, Baudelaire, and above all Nietzsche were the most important. One of its first spokesmen was Dmitri Merezhkovsky (b. 1865) who in the 'nineties and at the beginning of the 20th century did excellent work as the interpreter of foreign cultural values—the historical novels *Julian* (1895) and *Leonardo* (1901). His later work, dominated by a sophisticated and essentially hollow "religious" philosophy, is of much less value. *Alexander I.* (1913), *14 December* (1918, Eng. trans., 1923), are interesting for their historical material, but their style is disagreeably hysterical and the construction disfigured by artificial and meaningless "ideas." As a "religious" philosopher, Merezhkovsky is an obvious nonentity.

The real revivers of Russian mystical and religious thought were, after Vladimir Soloviev, Vasilii Rozanov (1856–1919), and Leo Shestov (b. 1866). Rozanov is also the greatest modern master of Russian non-narrative prose. His later works, especially *Alone With Myself—Uedinennoe* (1912) and *Fallen Leaves* (1913), place him in the front rank of Russian prose-writers of all times as well as in that of the greatest thinkers and discoverers of the human soul. By rejecting what he called the "Gutenberg" style he made prose as flexible, unexpected and spontaneous as spoken language. He was a profound irrationalist, organically adverse to logical constructions, but possessed of a sense of intuition and insight unequalled by any man. His religion was mainly a religion of sex and procreation, but he had a deeply ingrained sympathy for the traditions and the soul of Russian Christianity. Shestov is also a mystic and an irrationalist, but he is as spiritual as Rozanov is vital. In his war against reason he uses with consummate skill the weapons of the enemy. The central impulse of his work is the search for God, who is above good. His style is akin to Tolstoy's and is admirable for its lucidity and pungency.

Rozanov and Shestov are the biggest figures of the "religious-philosophical" movement begun about 1903, which has very largely displaced the traditional agnosticism of the Russian intelligentsia by some kind of mystical religion. It produced numerous writers, who, though they are not comparable in significance and originality to these two, have had a notable part in the history of the Russian mind. The most noteworthy are Sergius Bugakov (b. 1870), who, beginning as a Marxist later became an orthodox priest; Paul Florensky, a mathematician, who likewise became an orthodox priest, the author of a most remarkable, sophisticated and subtle book of theology, *The Pillar and Foundation of Truth* (1913); Nicholas Berdyaev (b. 1874); Michael Gershenzon (1869–1925); and Vyacheslav Ivanov, who besides being a remarkable poet is the most magnificent contemporary master of ornate Russian prose. *A Correspondence Between Two Corners*, by Gershenzon and Ivanov (1920) is a remarkable book discussing the value of culture before the terrible realities raised by the revolution.

*The Symbolists.*—The most important expression of the "modernist" movement was the Symbolist school of poetry. The name came from France, but except in its first stages the Russian movement was not derivative and its most significant poets were the genuine heirs of the great national tradition. At first the Symbolists (or Decadents as their enemies called them) were regarded as mountebanks and charlatans and were not admitted into the literary rank. But to-day it is universally recognised that the poetry of the Symbolists was the most important thing in Russian literature in the 10 or 15 years preceding the great revolution. The Symbolist movement was, first and foremost, a general revival of poetry and poetic culture after the ignoble stagnation of the later 19th century. But besides that,

the Symbolist poets have certain characteristics common to all of them; these are the "Symbolist" attitude, *i.e.*, a perception of the world as a system of symbols and "correspondences" (the word came from Baudelaire's well-known sonnet); and a predominance of the musical over the logical, of the "romantic" over the "classical" element of poetry. In its early stages Russian Symbolism was imitative of foreign (French and English) models. The work of the first leaders of the school, Constantine Balmont (b. 1867) and Valeri Bryusov (1873–1924) have a translated and un-Russian flavour.

Balmont, a genuine poet with a great gift of song, wrote his best poetry between 1894 and 1904. Bryusov, a laborious craftsman who compared his inspiration with an ox in the plough, in the first decade of the 20th century. The importance of these two poets was chiefly that of a ferment. They liberated poetical understanding and taste and raised the general interest in problems of form. Bryusov, especially, had a powerful technical influence; few poets who began writing verse in the first decade of the century escaped it. For many years he was practically dictator of the advanced literary world of Moscow. By their side there were other poets of a more original and at the same time more native and traditional inspiration. Fedor Sologub (pseudonym of Fedor Teternikov, b. 1863) who is also one of the most remarkable modern novelists, is the most traditional and the most perfect of the Symbolist poets. His poetry is sober and severe and almost classical in its adequacy of expression. It is dominated by a complete and consistent conception of the Universe, which is its essence is Manichaeism. The evil world of life, diversity, desire, light and heat, symbolised in the hateful dragon of the sky, the Sun, is opposed to the blessed realm of death, coolness and peace. Zinaida Hippis (in Russian Gippius, maiden name of Mme. Merezhkovsky, b. 1867) is also a metaphysical poet. Intensely intellectual, in her best poems she is one of the most genuine and powerful spiritual children of the darker side of Dostoevsky. She is also a craftsman of great originality and has had an appreciable influence on the evolution of poetical technique.

Another metaphysical poet is Vyacheslav Ivanov (b. 1866). Sophisticated and complex, soaked in knowledge and in culture, his poetry is the expression of a mystical philosophy that aspires to the synthesis of all religions. Of all Russian poets he is the most full of Greek reminiscences. His style is archaic and magnificent, the most artificial and ornate style in the language. From 1906–12 he was as much a dictator of poetry in St. Petersburg as Bryusov was in Moscow. His principal works are *Pilot Stars* (1903); *Cor Ardens* (1911); and *Winter Sonnets* (1920). The poetry of Innocent Annensky (1856–1909), like V. Ivanov a scholar and a translator of Euripides, is curiously devoid of all classical influences. Exiguous in extent, it all belongs to the last years of his life (*The Cypress Chest*, 1910). It is an infinitely subtle personal poetry of emotions, free from metaphysical sophistications, but condensed and elliptical to the point of obscurity. He is the subtlest and most refined of the Symbolists, but for intensity of human appeal he has no equal except Blok.

Alexander Blok (1880–1921) is unquestionably the greatest poet of modern Russia. His early work *Verses of the Beautiful Lady* (1904) was inspired by a mystical love for a feminine hypostasis of the Deity in the vein of Vladimir Soloviev's mystical poetry. It is purely immaterial and musical, woven of the thinnest atmospheric gossamer, and to the immediate perception almost elusive. But soon Blok lost his mystical visions, and his later verse is full of a passionate home-sickness for the lost ideal. It is distinctly romantic in style and in matter dominated by the unbridgeable and hopeless opposition between life and the higher reality lost touch with. Much of his later poetry is "realistic" and instinct with a grim and hopeless irony. More than any other poet, Blok was a "prophetic soul." He lived the life of the nation with passionate intensity, and much of his verse reads strangely in the light of later events. The third volume of his collected poems (1908–16) contains most of his best work. He accepted the revolution as an expression of the

mystical and craving soul of Russia, and in 1917 wrote his most widely famous and in certain respects his most significant poem *The Twelve* (Eng. trans. 1920), a sublime symphony made out of realistic dirt. After 1917 he wrote practically nothing. Besides his lyrical poetry he wrote several lyrical plays *The Puppet Show* (1906); *The Stranger* (1907); *The Rose and the Cross* (1913), in which he gives the most powerful expression of his "romantic irony," and a narrative poem *Retaliation* (containing the life story of his father), at which he worked for over 10 years and left unfinished. It contains passages of exceptional historical intuition.

Closely connected with Blok is the personality of Andrey Bely (pseudonym of Boris Bugaev; b. 1880), the most original and "advanced" of the younger Symbolists. His poetry is mystical in content, experimental in form, and frequently realistic and humorous in tone. He carried the musical and antilogical tendencies of Symbolist poetry to their furthest limits, and in his efforts to do altogether without the cement of sense has much in common with the early Futurists. His principal works, however, are his novels.

Most of the inner Symbolists followed in the footsteps of Bryusov and V. Ivanov. Their poetry is intensely, often coldly, formal and is chiefly concerned with the visual symbolism of abstract ideas. The most notable are Maximilian Voloshin (b. 1877), whose poems on the revolution (1917 and following), splendidly ornate and highly sophisticated, became widely popular among the émigrés; and Vladislav Khodasevich (b. 1886), who treats Dostoevskian "underground" themes with a neat and abstract "wit" reminiscent of the 18th century, and is the favourite poet of the unpoetical reader.

*Post-Symbolist Poetry.*—The exclusively metaphysical character of Symbolism produced a reaction towards more concrete and less sophisticated poetry. The tendency appears already in the affectedly naïve and exquisitely refined poetry of Michael Kuzmin: *Alexandrian Songs* (1906); *The Seasons of Love* (1907). About 1912 it took form in the movement that called itself the *Acmeists* and centred round the Poets' Guild in St. Petersburg (Leningrad). Its leader was Nicholas Gumilev (1886–1921, executed by the Bolsheviks), the only Russian poet to have fought in the World War. His poetry is a strange mixture of aestheticism with a manly romanticism. It is the most "masculine" poetry in the language. His best books, *The Quiver* (1915), *The Pyre* (1918), *The Pillar of Fire* (1921), contain poems of great force and vitality. He was a great craftsman, and all the younger poets of St. Petersburg were deeply influenced by his example and his teaching. The poetry of Anna Akhmatova, exiguous in extent and exquisite in form, is also an assertion of the human against the mystical poetry of the Symbolists. It is personal and emotional. By far the greater part of it is concerned with love. It is marked by a reticent and condensed intensity of emotion and by an exquisite and delicate economy of poetic means: *Beads* (1914), *The White Flock* (1917), *Anno Domini* (1922). Like almost all the greater contemporary Russian poets, Akhmatova has also written remarkable poems inspired by the great sufferings of her country.

Connected with the Poets' Guild is also the poetry of Osip Mandelstam (*The Stone*, 1916; *Tristia*, 1922), the greatest master in modern Russia of the grand oratorical style, which, however, is combined in his poems with a construction along purely associational lines that makes his poetry akin to the tendencies of early Futurism.

*The Futurists.*—Russian Futurism dates from soon after 1910. In St. Petersburg it was merely an assertion of the rights of vulgarity. The poetry of Igor Severyanin (b. 1887), *The Thunder-Seething Cup* (1912), which at one moment fascinated even the most discriminating critics, is merely the expression of the mentality of a shop assistant, who happens to be endowed with exceptional rhythmical power. Much more significant are the Moscow Futurists. Victor Khlebnikov (1885–1922), whom they regard as their founder, was a deliver in language rather than a poet. His poetry, which is purely linguistic, is caviare to the general, but has been a powerful stimulant to his fellow-

craftsmen. His historical importance lies chiefly in the fact that he started the movement of what may be called the "de-Italianisation" of Russian. To give the language of poetry a more rugged and virile accent and to tear it away from the withering background of traditional associations was the principal task of the Futurists. Besides trying to transcend the limits of sensible language, they destroyed the traditional conceptions of the "poetical" and the "musical," introduced the vocabulary of the street and new subject-matter from all quarters of life.

The most outstanding of the Futurists is Vladimir Mayakovsky (b. 1893), a poet with powerful lungs and a voice like the roar of waters. His powerful, unrefined, hammering poetry is at its best in his own delivery. He is a poet of the street and of the open air. Much of his verse is political; like most of the Futurists, he is a Communist. Totally lacking in the "finer touch," it is intensely original and skilful and is one of the most vital and vigorous literary growths of modern Russia. Though loyal Communists, the Futurists are regarded by the Soviet authorities with distrust as too individual and undisciplined. An official effort was made from the beginning of the new régime to create a more reliable "Proletarian culture" and "Proletarian poetry." The "proletarian poets" are numerous and have been regularly trained by masters of the craft, such as Bryusov, in the secrets of verse writing. But in spite of this, all they write is nothing but rhetoric. The only exception is Vasili Kazin, a young workman of Moscow, who is free from rhetorical ambition and has written lyrics of exquisite freshness not unlike those of Mr. W. H. Davies.

*Peasant Poets.*—Another group of poets connected with the revolution are the "peasant poets" who saw in it an assertion of the mystical aspirations of the Russian people. Of these peasant poets Nicholas Klyuev is a genuine mystic and genuine poet, imbued with the traditional lore of North Russia. The other peasant poet, Sergey Esenin (1895–1925), was only transiently attracted by the conceptions of mystical socialism. He was a purely lyrical poet akin to the Russian folk song, to Blok and to the tradition of the 19th century. His best verse has an exquisitely piercing lyrical accent. A wistful and uneasy melancholy dashed through by a dare-devil "hooliganism" are the main motives of his poetry.

At one time Esenin was connected with the "Imagist" movement, which in spite of its noisy prominence in the years immediately following the revolution produced no poet of importance. In general, except the Futurists, most poets of the post-Symbolist generation belong to no movement or school, and display a great variety of individual genius. The most absolutely independent of all is perhaps Tikhon Churilin, whose *Spring after Death* (1915) breathes the spirit of genuine madness and startling originality. Externally connected with Futurism, but in essence quite independent, is the poetry of Boris Pasternak (b. 1891), in the opinion of most fellow-craftsmen the greatest poet of the young generation. His principal book of lyrics, *My Sister Life*, was written in 1917 and published in 1922. Few Russian poets have escaped its overpowering influence. Pasternak's poetry is marked by an absolute freshness of perception and vision combined with a tensify of lyrical emotion that is to be found only in the greatest lyrical poets. He sees the world in his own way, like Adam or a new-born child, and his poems sound as if no verse had ever been written before them. But he does not always succeed in keeping in control the excessive abundance of his poetic vision and becomes at times incoherent and confused.

Equally original and equally fresh is the poetry of Marina Tsvetayeva, the only important poet of the younger generation living outside Russia. The variety and richness of her rhythmical imagination, the spontaneity and abundance of her inspiration, combined in her latest work with an unerring mastery and discipline of form, the absolute originality of her accent, the vitality and exuberance of her genius, make her one of the most powerful of the poets of to-day. This vitality and high-spiritedness is a common feature of almost all the major poets of the younger generation and marks them off distinctly from the

Symbolists. Marina Tsvetayeva's latest poems are her best: *Molodets*, a fairy tale (1924), *The Poem of the End* (1925), *The Ratcatcher* (1925). Among the very youngest poets the most important seem to be Nicholas Tikhonov and Ilya Selvinsky, both of whom have written some powerful and concentrated ballads of the civil war.

*The New Prose.*—Many of the Symbolists wrote prose fiction but they failed to create a new school of prose. Some derived from Dostoevsky (Z. Hippus), others indulged in "Impressionism"; others again fell back on foreign or ancient models and wrote what is called in Russian "stylised" prose. The most remarkable of the "stylisers" are Valeri Bryusov, whose historical novel of the German renaissance, *The Fire Angel* (1917), is no doubt the best Russian novel on a foreign subject and the most genuine work of the author; and Michael Kuzmin. The greatest of the Symbolist novelists is Fedor Sologub. His principal novel, probably the greatest Russian novel since Dostoevsky, *The Little Demon* (1907, Eng. trans. 1916), has all the appearance of a realistic story of provincial life, but is subordinate to a symbolistic conception. The central figure, the schoolmaster Peredonov, the incarnation of joyless evil, is one of the grimmest and weirdest creations of the Russian imagination. Others of his stories have a more or less fantastic or conventional setting. The series, *The Created Legend* (*Drops of Blood*, *Queen Ortruda* and *Smoke and Ashes*) (Eng. trans. 1916) is a strange symbolical novel dominated by the same Manichaean philosophy that permeates his poetry, but couched in the form of a thrilling romance of intrigue of the "Prisoner of Zenda" type.

The revolution that corresponds in Russian prose to the Symbolist revolution in poetry was started by two men of the younger Symbolist generation, Bely and Remizov. Both of them use, in their principal work, the material of contemporary life, and both have greatly intensified the expressive means of Russian prose. Their prose is what has been called "ornamental" (not ornate), that is to say it is always charged with the utmost expressiveness and saturated with the most varied effectiveness; it is the antithesis of the transparent prose of the realists of the 19th century. Bely has been strongly influenced by Gogol. Unlike the other Symbolists, he has a genuine gift of humour. His first novel, *The Silver Dove* (1909), is the story of an intellectual allured and enmeshed by mystical sectarians. *Petersburg* (1915), the atmosphere of which is reminiscent of Dostoevsky's *The Double*, is a symbolic story of Petersburg, as the incarnation of "nihilism." *Kotik Letaev* (1917) and its sequel *The Crime of Nicholas Letaev* (1922) are written under the influence of the anthroposophy of Steiner. The rhythmical intensity of the style reaches its farthest point. It is the story of a childhood, and of the gradual formation of the child's idea of the world. Besides these novels Bely has written the remarkable *Recollections of Alexander Blok* (1922).

Alexey Remizov (b. 1877) is a writer of great complexity and versatility. All his work is marked by a supreme sense of style and an exceptional mastery of Russian idiom. He rejects the ordinary literary syntax of Latin and French extraction and aims at creating a written Russian that will be more akin to the genius of the spoken language. The variety of his work is very great. It includes novels of "compassion" in the line of Dostoevsky, *The Pond* (1905), *The Sisters of the Cross* (1910); stories of provincial life, *The Story of Stratilatov* (1909), *The Fifth Pestilence* (1912) in a manner that has more than anything else affected the destinies of Russian prose; *In a Field Azure* (1922), the delightful and simple story of the childhood of a little girl; adaptations of folk tales and legends; dreams that are real dreams with all their illusive logic; *Recollections* (especially *Kukhka*, 1923, about Rozanov); poems in prose; plays, based on the popular Russian theatre. More than anyone Remizov has been a sensitive record of the ordeals of his country's life in the terrible years 1917-21, and the book, including his diary of these years and stories of dying St. Petersburg (*Russia in the Tornado*, to be published in 1926) is one of the greatest books produced by the revolution.

Remizov (especially as a stylist and as the author of *The*

*Story of Stratilatov*) has had an enormous influence on almost all subsequent fiction. A new realism, emancipated from the "civic" ideas of the 19th century and attracted by the characteristic and grotesque rather than by the commonplace, arose about 1910, largely owing to him. The most popular and gifted of these neo-realists is Count Alexey Tolstoy (b. 1882), who began with a delightful book of folk tales (*Magpie's Tales*, 1909), and has written more stuff that is at the same time generally readable and intrinsically valuable than any other living Russian author. At times he becomes ridiculous, but the verve and vitality of his narrative manner is inimitable. One of his best books is *Nikita's Childhood* (1922) that holds its own by the side of the best "childhoods" in Russian literature. More Remizovian is the work of Michael Prishvin (b. 1873), whose *The Beast of Krutoyarsk* (1913), the story of a dog, is the masterpiece of Russian animal fiction, and the early work of Evgeni Zamyatin (b. 1884), who later developed into an original and independent master. He is an imagist and impressionist trying to attain the maximum of intensity by the use of significant detail and by constructing his stories round a unifying symbolical image. His principal work, *We*, a novel of the future, was still unpublished in 1926 owing to the Soviet censorship.

The World War remains almost unreflected in Russian literature, and Russia has little to compare with the War literature of the Western nations. The only war poetry of any merit is Gumilev's. The very few war books that deserve notice are *Letters of an Artillery Subaltern*, by Fedor Steppun (1918); *The Face of War*, by Ilya Erenburg (1920); and *The People at the War* (1918) by Sophia Fedorchenko, a wonderful collection of fragments of conversations overheard by an army nurse from private soldiers. The revolution of March 1917 remained as alien to the Russian imagination as the War. Not so the Bolshevik revolution of eight months later and the ensuing civil war. The external result of these events was the division of all intellectual Russia into two hostile camps, which has now become a geographical division between those who have remained in the U.S.S.R. and the *émigrés*. Roughly speaking, it may be said that the older generations are pretty equally divided between the two sections, but the younger generation (under 30) is producing valuable work only at home. Of the vast memoir literature created by the revolution and civil war the most significant books are 1920 (1921) by the monarchist deputy of the Duma, Vasil Shulgin, and *A Sentimental Journey* (1923) by the gifted and influential critic Victor Shklovsky. With the memoirists may also be counted Mark Aldanov (Landau), who has written clever personal articles on contemporary public men and historical novels of the age of Napoleon.

The years of the civil war witnessed the almost complete disappearance of prose fiction, but since 1921 a galaxy of young novelists have come up who choose their subjects almost exclusively from the revolution, the civil war and contemporary Soviet life. The majority of these writers have been more or less influenced by Remizov, Bely or Zamyatin and belong to the "ornamental" school. Their besetting sin is their inability to tell a story, and an over-emphasis on style and formal originality. The most typical of these writers are Boris Pilnyak (b. 1894), Vsevolod Ivanov (b. 1895) (stories of civil war in Siberia), and Leonid Leonov (b. 1899). More original is the work of Constantine Fediin (b. 1892), whose *Cities and Years* (1924), an ambitious and in many ways successful attempt to show the evolution of an "intelligentsia" mind against the background of war and revolution, is the most notable Russian novel written since the revolution. Isaac Babel is the author of *Tales* (1925) of the Cavalry Army of Budeny. For the most part they are "intensified anecdotes" written with great artistic concentration.

Their atmosphere is mingled horror, irony, and hero worship. He uses dialect in an imaginative way that is reminiscent of Synge. The young Communist, Artem Vesely (whose work at this time was uncollected), has a unique genius for the painting of mass scenes and is a consummate master of language. Quite apart from the others stand the *Tales* (1925) of the poet Boris

Pasternak. They are written with the same freshness and novelty of vision that mark his poetry. *The Childhood of Luvers* (1918), the story of how a little girl forms her perception of the world around her; is particularly remarkable. The greatest part of modern Russian fiction is conspicuously devoid of narrative interest, and it is no wonder that the Soviet reader prefers less original and intense or careful work as long as it is "interesting." Their tastes are best met by the novels of Ilya Erenburg (b. 1891), whose *Adventures of Julio Jurenito* (1922) is a grim and significant satire of the capitalist world, but whose later novels are typical best sellers adapted to the tastes of the Soviet reading public.

*Drama.*—The Russian drama has been in a state of stagnation ever since the death of Chekhov and cuts a poor figure by the side of contemporary poetry or even of fiction. The plays of Gorky (*The Lower Depths*, 1903, Eng. trans. 1910), and of Andreyev, written in imitation of the method of Chekhov, miss precisely all the inner "musical" logic that justifies the non-dramatic construction of Chekhov. The "modernistic" dramas of Andreyev (*The Life of Man*, 1907, etc., Eng. trans. 1915), are crude rhetoric in black and red. More satisfying is the symbolic melodrama, *He Who Gets Slapped* (1916, Eng. trans. 1922), which was later turned with great advantage into a film. The genuine Symbolists failed to produce a theatre of their own, and with the exception of the beautiful dramas of Blok, which are lyrical rather than dramatic, gave nothing to the stage.

For the Russian theatre the period was one of rapid development and of remarkable achievement. But the drama did not keep pace with it. Of the reforming producers who revolutionised the Russian stage, Nicholas Evreinov (b. 1879) is also a playwright. His theatre is subordinated to his semi-religious idea of transforming life into art by the aid of the theatre. His work has points in common with that of Pirandello. The realistic tradition has been definitely abandoned by dramatists and the dominant form of play in Soviet Russia is a kind of conventional puppet play of ideas, where the characters, stripped of all reality and humanity, are made to symbolise abstractions. Such are the crude and mediocre plays of Lunacharsky. On a much higher artistic level are the plays of the regretted Leo Lunts (1901–24) who endeavoured to create a pure and simplified tragedy of pure action that would be once again suited to the expression of genuine heroic feeling. The Futurists made attempts to create a high standard, boldly Aristophanesque propaganda drama. The only successful attempt is *A Mystery Bouffe* (1919) by Mayakovsky, a vigorous and effectively crude play of Bolshevik satire. There exist English translations in book form of works by Gorky, Andreyev, Bunin, Artsybashev, Kuprin, Shmelev, Ropshin (Savinkov), Merezhkovsky, Shestov, Z. Hippis, Sologub, Blok, Remizov, Aldanov, Pilnyak, Evreinov and Lunacharsky.

**RUSSO-POLISH CAMPAIGN.**—This campaign, of 1920, which resulted in the defeat and rout of the Soviet Army when it was within sight of the Polish capital, is full of dramatic incident. Organisation of command, staff and administration was lacking on both sides, but above all it was the want of a proper system of supply which accounted for the sudden collapse of troops engaged in a victorious advance. The thinly populated territory lying between the Niemen in the north and the Dniester in the south was incapable of supporting large bodies of troops, and as both sides attempted to live on the country during their advances the failure of their operations followed quickly each success.

*Cause of the War.*—During the course of 1919 and early 1920, the Soviet Govt. had succeeded in clearing their territory of the White Russian detachments under Kolchak, Denikin and Yuden-

ich. They were thus at liberty to examine the situation on their frontiers. With such a mixture of races living side by side in the disputed regions no delimitation of frontier would have suited all parties, and in the absence of authority to enforce a decision, trouble quickly arose between the Soviet and the newly formed Polish State. Poland was determined to maintain her new liberty and had called up fresh levies to support the various legions which had been repatriated from the fronts upon which they had been fighting in the World War. The Soviet began to concentrate their troops towards the west. Inflammatory speeches in Moscow and a fierce propaganda amongst the Polish working people brought Polish public opinion to a fever heat. From seven divisions in Jan. the Soviet had, by March, increased the number of their troops facing the Poles to 20 divisions, with three cavalry divisions. Poland decided that she could not wait quietly for the inevitable Soviet attack by which she would certainly be destroyed, and that she must act at once.

*Polish Offensive.*—Strategically, the territory in dispute may be divided into two separate areas: White Russia in the north and Volhynia and Podolia in the south. The marshes of the Pri-pet divide one area from the other. Acting in collusion with Petlura, the Hetman of the Ukraine, who had promised to raise his country against the Soviet, the Poles advanced in April as far as Kiev. By the beginning of May the Polish-Soviet front ran from Dvinsk in the north along the course of the Dnieper to Kiev and thence to the Dniester near Kamenets. No sooner were the Poles established in Kiev than the Soviet northern army began to advance. The Poles were able to transfer troops from the south and counter-attacked the Soviet forces which had already penetrated as far west as Lidā and Baranowicz. By the end of May the line held at the beginning of the month had been restored. Operations had been most ably carried out by the Polish Minister of War, Gen. Sosnkowski, but there were indications that the Soviet were transferring more and more troops to the west and that a renewal of their attacks might be expected.

At the beginning of June, in the southern area there appeared a new Soviet cavalry leader, Budenny, who completely altered the situation. Budenny had been a non-commissioned officer in the old Russian Army and soon proved himself a man of action. Within a month he had driven back the Poles a distance of 200 m. until their line in the south ran just east of Pińsk and Równe (Rovno) to the junction of the Dniester and Siret (Sereth) (see EASTERN EUROPEAN FRONT: MAP).

*Russian Success.*—Fighting in the northern area continued intermittently during the month of June, preventing the Poles from transferring troops to the hard-pressed south. Despite the operations in the south it was clear that the main Soviet attack was coming in the north. On July 4 the blow fell. The whole Polish line gave way. Wilno (Vilna) and Minsk were lost in the first week. Grodno fell on July 20 and Białystok on July 25. By the end of July the Soviet advance guards had reached the Bug. In 25 days the Poles had lost 300 m. of territory. The main cause of the collapse was their failure to constitute reserves. In their desire to protect their new territory they had been led into a linear defence where they were strong nowhere. Their forces were insufficient to defend a line nearly 800 m. in length.

*Disposition of Troops.*—The Polish situation was now critical. On the Bug their men fought with desperation and the Soviet advance was checked. No time was to be lost, however, or the Soviet would carry out fresh concentrations. With the help of the French military mission, under Gen. Weygand, a plan for a great counter-attack was evolved on Aug. 6. The situation of the opposing sides on that date was as follows:—

*Soviet:* (1) Northern group. Four armies—IV., XV., III, and XVI.—on the Bug from Rozan to Brest-Litovsk, with a cavalry corps on the extreme north skirting the East Prussian frontier and aiming to outflank the Polish left.

(2) Southern group. Two armies—XII. and XIV. with Budenny's cavalry, along a line from Kowel through Brody to Tarnopol. The men of the Soviet Army were unfed and worn out with a month's marching. Only the thought of the rich booty to be obtained in Warsaw maintained them in the ranks.

**Poles:** (1) Northern group. Four detachments—Roja force, I. Army, IV. Army, Sikorski's force—facing the Soviet northern group from Brest-Litovsk to the East Prussian frontier at Chorzele. This group was formed of units which had been retreating for over a month, strengthened by reinforcements thrown in hastily as they came up. Much material had been lost and the men were tired and hungry. The situation presented a picture of great disorder, but the approach to the line of the Vistula was beginning to simplify the supply of food and munitions.

(2) Southern group. Three armies—VI., III. and IV.—facing the Soviet southern group. Here the situation of the Poles was much better. Pressure from the enemy had been by no means so severe as in the north and many of the divisions still retained their original fighting value.

**Polish Plan of Attack.**—The Polish plan was to withdraw all but a minimum of force from the southern area and to attack the Soviet northern group with the greatest possible strength. The operation bears a close resemblance to Ludendorff's manoeuvre at Tannenberg. In many respects the situation was similar. The Russians were advancing in two main groups divided by the Pripiet marshes instead of the Masurian lakes. Here the Soviet southern group was advancing slowly like Rennenkampff's army in 1914. The situation would become critical as soon as the two Soviet groups converged upon the Polish Army. No time was to be lost. Would the commander of the Soviet armies in the south allow himself to be deceived in the same manner as Rennenkampff?

On August 6 orders for the following fresh groupings were issued from Polish headquarters.

(1) Three armies—II., I. and V.—under Gen. Joseph Haller, were to withdraw slowly to the line of the Vistula from Dęblin to Modlin with the V. Army pushed well forward on the left to prevent any outflanking of the Polish left between Warsaw and the East Prussian frontier.

(2) Two armies, III. and IV.—were to concentrate behind the Wieprz between Chełm and Dęblin, ready to strike due north. The advance of these two armies to commence on Aug. 16.

(3) One army, VI.—would withdraw as necessity arose in the direction of Lemberg, tempting the Soviet southern group away from the critical point in the north.

By Aug. 12 all the armies, with the exception of the two on each flank, had reached their assigned positions without incident. In the south the III. had found the XII. Soviet Army advancing and had been forced to throw out a detachment on its right flank to cover its concentration. It had been delayed in consequence. In the north, the V. had been driven back by overwhelming strength and had been unable to prevent the enemy outflanking movement.

Enthusiasm in the Polish Army had risen surprisingly in the days since the momentous decision to attack had been taken. The chief of the Polish State, Marshal Pilsudski, had himself taken command of the III. and IV. Armies. With the help of Weygand and his staff the service of supply had been restored. New bodies of reinforcements were moved forward from the depôts in Western Poland and the depleted units began to raise their heads again. National optimism returned. The enemy in the south made no determined move and appeared to have no inkling of what was afoot. Every hour that he delayed meant more chance of success for the Polish plan.

**Polish Advance.**—Gen. Sikorski's V. Army in the north was the first to move. The Soviet movement round his left had assumed alarming proportions and had to be stopped. On Aug. 14 he pressed forward from his defensive position at Modlin and at once encountered the Soviet XV. Army advancing to the attack. Sikorski persisted in his attacks all through Aug. 15 and 16, his men fighting with determination. Not even the appearance of elements of the Soviet IV. Army in his left rear turned him from his purpose. Throwing out covering detachments to watch his rear he attacked again on Aug. 17. His determination reaped its reward, for the enemy gave way in front of him, their retreat rapidly developing into a rout.

In the south Pilsudski's armies made good progress. The blow against the left of the Soviet XVI. Army came as a complete surprise and they offered little resistance. During Aug. 16 and

17 the Poles covered over 50 miles. By Aug. 18 the III. Soviet Army, which lay between the XV. destroyed by Sikorski, and the XVI. broken by Pilsudski, turned also in hopeless confusion.

On the extreme Soviet right their IV. Army, containing some of the most famous Communist regiments, together with the cavalry corps, had reached the Vistula between Toruń and Płock in their great turning movement. They were preparing to roll up the Polish left when Sikorski suddenly advanced. Had they advanced resolutely even then, all might have been well, but they hesitated and were lost. Their half-hearted attacks against Sikorski's left had little effect. It was not till Aug. 20 that the order for a general retreat reached them. On Aug. 22 at Miawa, and Aug. 23 at Chorzele, they were successful in cutting themselves a passage, but on Aug. 24 at Kovno they ran up against Pilsudski's IV. Army blocking the way. Almost without making an effort to attack they passed ignominiously over the East Prussian border to internment.

The pace of the Polish pursuit was remarkable. From Aug. 16 to Aug. 25 the advanced units of the II. Army had covered 200 m. as the crow flies. The IV. Army averaged 25 m. a day in their advance. The service of supply was left far behind. The troops existed as they could upon the exhausted country. Luckily the Soviet resistance was so completely broken that there was no further fear of counter-attack and the Polish units had ample time in which to reorganise.

**Conclusion.**—The results of the battle of Warsaw, as it has been named, are only exceeded by those of Tannenberg. The Poles captured 70,000 prisoners, 200 guns and 1,000 machine-guns. From 50,000 to 100,000 Soviet troops passed over into East Prussia. The victory of the Poles was due to the adoption of a determined offensive based upon a sound plan. The raising of the morale of the beaten troops by the Polish authorities, roused to enthusiasm themselves by the inspiring presence of Gen. Weygand, is little short of miraculous. The crisis of the battle was undoubtedly Aug. 15-16, when Sikorski's V. Army cleared its front. If it was Pilsudski's force which completed the Soviet defeat, it was undoubtedly the magnificent fighting of Sikorski and his men which made victory possible.

**RUSTLESS STEEL.**—Rusting under usual atmospheric conditions is a universally recognised characteristic of iron. It is everywhere accepted, like the law of gravity, as an unquestionable fact. Those who use iron or steel in exposed places always take into account that it must be protected from rust or be ultimately replaced. The rusting of iron has been studied by chemists for many generations. In the journals of chemical and physical societies, and in books, the subject has been discussed at great length in relation to a variety of explanatory theories.

**Experimental Test.**—A useful idea which seems to lead to the root of the matter can be acquired by an interesting and very simple experiment. On placing a few bright iron nails in a test tube filled with water the iron is observed, in the course of a few days, to be covered with rust. Some particles of rust may be observed on the inside of the tube above the nails. These particles may have risen from below or fallen from above the position in which they are found. If they have fallen from above it should be possible, by interposing a diaphragm, to collect them and keep them separate from such rust as may form on the bright iron at the bottom of the tube. A suitable diaphragm can be made from cotton wool or a piece of lightly rolled blotting paper. Having added two or three bright iron nails, filled up the tube with recently boiled water and adjusted the diaphragm at different heights in several tubes otherwise similarly prepared, the tubes are kept in a quiet place away from direct sunlight. During the first few days nothing appears to happen. After two or three weeks the nails are still bright, but a faint band of rust may be noticed on or in the white diaphragm. As weeks and months go by the band of iron rust in the diaphragm grows more distinct and broader.

It seems certain that the iron visible in the diaphragm, as rust, could be found inches above the nails only if iron from the nails had dissolved in the water and diffused upwards. It seems equally likely that the band of iron rust becomes visible in the diaphragm because the oxygen of the atmosphere in contact with the upper surface of the water has dissolved there and diffused downwards. In an open tube the reaction between the dissolved oxygen and the dissolved iron

forms rust which falls onto the bright nails. In a tube correctly fitted with a suitable diaphragm the two diffusing substances meet and react within or above the diaphragm and the solid product is held there, leaving the nails bright and smooth but slowly losing weight as the years go by.

One of the characteristics of pure iron is that rusting leaves it with a smooth surface. On the other hand rusted steel has generally a pitted surface. Also mild steel rusts more quickly than good wrought iron. The reason for this is worth mentioning. If polished and etched, the surface of pure iron is seen, through a microscope, to consist of a conglomeration of grains, each white like its neighbours; the grains are irregular in shape but may be visualised as so many silver coins lying on the banker's counter. When similarly polished and etched, a piece of mild steel is seen to consist of dissimilar grains; some are white in appearance and others black. These may be visualised as a mixture of silver and copper coins lying side by side on the banker's counter.

On placing a clean half-crown on either side of the tip of the tongue there is no perceptible taste. On placing silver coins on each side of the tongue and nipping the free ends of the coins together whilst the tongue is between them there is no perceptible taste. On going through the same performance with copper coins similar results are obtained. If, however, the experiment be repeated with one silver and one copper coin, which singly are tasteless, it will be found that when in contact, with the tongue between them, the penny on the upper side of the tongue has a sharp metallic taste. The copper coin excites the sensation of taste (like an ordinary steel knife) because it is being dissolved and it dissolves more rapidly in contact with the silver in conformity with the general law that when dissimilar metals are in contact, in the presence of an electrolyte, one of them is apt to be selectively dissolved or corroded.

**Cause of Rust.**—From these experimental observations the rusting of iron appears to depend on the fact that iron is soluble in water. The rusting of steel at a greater rate than iron appears to depend on its solubility in water plus a degree of selective solubility due to the dissimilar nature of its constituent grains. If, therefore, iron is to become rustless under ordinary atmospheric conditions it must first be made insoluble in water. And further, in order to guard against selective corrosion, its composite grains should be made as similar as possible.

**Use of Chromium.**—The simplest and cheapest forms of rustless steels, but not the first in chronological order, are ordinary mild steels containing chromium. The resistance of the steel to rusting depends on the amount of chromium it contains. The addition of 10% of chromium to pure iron would suppress its solubility in water, and as the resulting pure chromium-iron would consist of similar crystals it might be regarded in itself as a satisfactory rust-resisting metal. But such pure chromium irons cannot be produced commercially. The commercial rustless steels always contain carbon which even in small amounts causes the formation of dissimilar crystals. Between 1912-4, a series of steels containing between 9 and 16% of chromium was investigated by Brearley (see U.S.A. patent 1107256/16), who concluded that with the stipulated amounts of chromium and not more than 0.70% of carbon, rustless steel articles could be produced providing they were submitted to suitable hardening operations with the object of suppressing differences in grain constitution due to the carbon in the steel. From this series of rustless steels developed by Brearley the familiar "stainless" cutlery is made.

The resistance of chromium steels to rusting is increased by adding chromium and decreased by adding carbon. Small amounts of carbon are always unavoidably present but definite amounts are also added with the object of producing required degrees of hardness, resistance to wear or ability to cut. The useful extent to which chromium alone can be added to iron is limited because ultimately such comparatively pure chromium irons are brittle and on that account are not in great demand for industrial purposes.

Steels containing more than 9% chromium were made as early as 1892. Their rust-resisting properties were not realised because at that time the resistance of steel to general corrosion was estimated by its measured resistance to solubility in dilute sulphuric acid. Since the solubility of high chromium steels in dilute sulphuric acid is greater than that of ordinary steel, the quest for non-rusting steels, depending on conventional tests, was directed away from and not towards the undoubted merits of chromium.

**Nickel Steels.**—Prior to 1912 the least corrodible steels in general use were nickel steels. The more nickel they contained the less they were supposed to corrode. Steels containing 25% nickel were held in high regard, as they were notably resistant to dilute sulphuric acid, an active corrosive agent in industrial towns or under special conditions as in chemical works or mines.

The addition of nickel to steels which already contain enough chromium to make them resistant to ordinary atmospheric corrosion produces useful results: (1) conferring a certain degree of resistance to the corroding effect of cold sulphuric acids, whether in the liquid or vapour form, (2) making those higher chromium alloys tough which, without the nickel, would be brittle, and (3) making it comparatively easy to secure homogeneous grain constituents with or without the necessity of submitting the alloy to special forms of heat treatment. Materials of this class were investigated by Strauss in Germany 1912-4 (English patents, 13414/13 and 13415/13). Strauss appears to regard the presence of nickel as an indispensable constituent of rustless steels, and Krupps, with whom he is associated, have devoted most attention to a steel containing about 20% chromium and 6% nickel. Steels of this composition are austenitic or can readily be made austenitic by quenching from temperatures of about 1,000° Centigrade. Such steel cannot be hardened by the usual heat-treatment processes. They are hardened by cold-working, as are all metals and alloys (see METALLURGY).

**Faraday's Work.**—The commercially more important rustless steels owe their properties to the presence of 10 to 20% chromium with or without the addition of nickel in amounts generally less than 10%. But attempts to preserve brightened and polished surfaces were made 100 years ago when both nickel and chromium were rare metals. Michael Faraday, amongst others, studied the subject in 1822. He produced an alloy which "after lying many months had not a spot on its surface." This alloy was a combination of steel with a considerable proportion of platinum. Faraday appears to have made 3% nickel and 5% chromium steels but produced nothing which resisted tarnishing except rare metal alloys which are much too costly for industrial use.

**Marsh's Work.**—If scalding at high temperatures be regarded as a form of corrosion, then the work of Marsh must be noticed. Looking for some substitute for platinum wire or strip to wind resistance coils, Marsh found what he required in an alloy of nickel and chromium. This material, alloyed with more or less iron, is familiar as the coiled filament of heated metal in office and bedroom radiators. Its value for that purpose, apart from its electrical properties, is that it does not scale when it becomes red hot. Marsh's nichrome alloy having satisfied all the requirements of a good radiator, neither Marsh nor anyone else appears to have connected its resistance to scaling at red heat with its possible value as a rustless alloy.

**Haynes' Cobalt Chromium Alloys.**—After Marsh, the American Haynes, who is reputed to have made the first motor-car in America, was busy with cobalt-chromium alloys. From his observations and experiments arose the well-known cutting tool material called "stellite" and a similar material in a malleable form from which Haynes made pocket-knife blades.

**Development.**—The development of rustless steels appears to follow closely the lines on which ordinary steels have developed. The rustless chromium steels were first used for table cutlery and aero-engine exhaust valves. When the valves were required to offer great resistance to scaling, silicon was added with good effect. When valves were required to be as hard at red heat as ordinary structural steel is at ordinary temperatures, 12 to 30% of nickel was added with good effect. To resist other specific conditions, other metals such as molybdenum, tungsten, manganese and copper have been added. In this way chromium irons are becoming the base of a series of rustless, scaleless and non-corroding alloys, whose possibilities are not likely to be completely explored for many years.

**Special Difficulties.**—The development of rustless steel is hampered by two difficulties. The first relates to its adaptability to existing manufacturing processes. This difficulty starts with the actual making of the steel and is met in every hot-working

and cold-working process. Apart from its rustlessness the most diverse and often antagonistic properties are required. The second difficulty relates to the smelting of the ore. The ferro-chromium alloy can be produced cheaply by smelting chrome-iron ore in the blast furnace but it contains unfortunately some 8 or 10% of carbon. This alloy is useless for making rustless steel because it contains too much carbon. For soft varieties of rustless steel the steel maker requires ferro-chromium alloys containing practically no carbon. To take the carbon out of the blast furnace ferro-chromium, costing about £20 per ton, involves an additional cost of £100 per ton. This is the price of ignorance; and it is still not known how to adapt cheap smelting operations to chromium ore without contaminating the product with carbon. Even if suitable chromium alloys were obtainable for nothing, rustless steels would still be more expensive than ordinary steels on account of steel manufacturing defects, which it is costly to avoid or remove.

**Chromium Plating.**—Closely bound up with the future of rustless steel is the possible development of chromium plating, which is arrested by unforeseen difficulties. Those interested in the production of chromium-plated articles assumed the possibility of covering mild steel with a coating which should exhibit *ne plus ultra* resistance to corrosion. The process appears to have failed for the same reason that nickel-plating fails when applied to steel articles exposed to weather conditions, since it is porous, and against a strong light is seen to be perforated. The same is true of chromium plating when peeled off, so that sooner or later moisture would find its way through the perforations and rust the unplated steel surface. Until this trifling defect has been overcome visions of chromium-plated steel castings and plated goods made from pressed mild steel, which would last for ever, are just visions. The unquestioned acceptance of rusting as a characteristic of ordinary steel has concealed the various causes which promote rusting. Since the introduction of rustless steels individual causes of general corrosion have been more sharply separated and defined. The most notable causes of corrosion, apart from direct solubility, are due to distortion and contact.

**Effects of Distortion and Contact.**—A piece of rustless steel used for stainless knives and containing, say 13% chromium, will remain bright if exposed in a country garden providing it has been suitably heat-treated. If, however, a piece of the same material be machined in a lathe the machined surface and the turnings themselves will rust, because they are distorted and probably to some extent because adjacent parts of them are distorted unequally. The more smoothly and less violently the surface is machined the less it is likely to rust. If ultimately the surface be smoothly ground and polished it will not rust. The polished surface does not offer easy lodgment for casual dirt but otherwise polishing in itself does not appear to exert a great restraint to rusting. A piece of the same 13% chromium steel, for example, in the form of cold-drawn wire which has simply been highly polished after cold drawing rusts with surprising readiness.

The corrosive effects of distortion can generally be avoided or eliminated. In many cases the direct effects are negligible, but the secondary effects of roughly machined surfaces may be serious. Foreign substances which readily adhere to rough surfaces produce contact corrosion. Almost any wet substance will cause corrosion of the lower chromium rustless steels, to start at the point of contact. A piece of string, glass, wood, paper or even the contact in still water of two pieces of the same low grade rustless steel promotes corrosion. In running water, contact corrosion is less noticeable and may even be entirely absent.

When the substance in contact with rustless steel is some other metal of a more electro-negative character the attack is greater and occurs more quickly. The effects of contact corrosion are also quickened and greater when the contact surfaces are wetted by sea water instead of ordinary water. Contact corrosion of the simpler kinds can be avoided by using higher-chromium rustless steels with or without the addition of nickel. For a few instances—notably in machines pumping hot sea water—the problems are difficult to deal with because the effects appear to contradict general rules and tendencies. This may be taken as a sure indi-

cation that the subject of contact corrosion, a most extended and energetic destroyer, has not been completely explored. (See also IRON AND STEEL.)

**RUTHERFORD, SIR ERNEST** (1871– ), British physicist, was born at Nelson, New Zealand, Aug. 30 1871 and studied at the University of New Zealand, where he took the B.Sc. degree in 1894. After a period of research at the Cavendish Laboratory, Cambridge, he became in 1898 Macdonald professor of physics in McGill University, Montreal; in 1907, Langworthy professor of physics at Manchester University; and in 1919 Cavendish professor of experimental physics in the University of Cambridge, accepting, in addition, in 1920, the professorship of physics at the Royal Institution, London. In a brilliant series of researches he established the existence and nature of radio-active transformations, the electrical structure of matter, and the nuclear nature of the atom. He was elected F.R.S. in 1903, and was knighted in 1914. Many British and foreign degrees and honours were bestowed upon him, including the Rumford Medal of the Royal Society, 1905, the Barnard Medal 1910, the Bressa Prize 1908, the Copley Medal 1922, and the Franklin Medal 1924. He was awarded the Nobel Prize for chemistry in 1908, and the O.M. in 1925 and was President of the British Association in 1923, and of the Royal Society in 1925.

His works include *Radio-activity* (1904), *Radioactive Transformations* (1906); *Radioactive Substances and their Radiations* (1912), and numerous papers in *The Transactions of the Royal Society*, *The Philosophical Magazine*, etc.

**RUTHERFORD, MARK** (c. 1830–1913), British author (see 23.940), died at Groombridge, Sussex, March 14 1913.

**RYAN, JOHN DENIS** (1864– ), American capitalist, was born at Hancock, Mich., Oct. 10 1864. In 1889 he went to Denver, where he was employed as a salesman of lubricating oils. In 1901 he secured an interest in a bank at Butte. In 1904 he was made manager of the Amalgamated Copper Co. in Montana, becoming president in 1908. He had been elected president of the Anaconda Copper Mining Co. in 1905, and after the merging of the Amalgamated interests in the Anaconda in 1910 he continued as president of the latter until 1918. He developed large water powers in Montana and in 1913 electrified the railway between Butte and Anaconda (100 m.), the success of which led to a wide expansion of railway electrification. During 1917–8 Ryan was on the executive of the American Red Cross. He was appointed in April 1918, head of the aircraft board of the Committee of National Defence, and in Aug. was appointed second assistant-secretary of war and director of air service of the U. S. Army, which position he resigned in November. In 1919 he was elected chairman of the board of directors of the Anaconda Copper Mining Company.

**RYDER, ALBERT PINKHAM** (1847–1917), American painter (see 23.949), died at Elmhurst, L. I., March 28 1917.

**RYKOV, ALEXEI IVANOVICH** (1881– ), Russian politician, was born in Saratov, the son of a peasant. Saratov was a place of banishment for revolutionaries, and Rykov came under their influence. When he went to Kazan he was already taking part in social democratic organisations. He was imprisoned and sent back to Saratov to remain under police supervision. Continuing his revolutionary work, he was rearrested, but escaped abroad before his trial. He visited Lenin at Geneva and returned to Russia as a propagandist in various industrial districts. In 1904 he was in Moscow, and in 1905 attended a congress of the Communist party which elected him a member of the party's central committee. On returning from the Congress he was arrested in St. Petersburg (Leningrad). He was

freed by the revolution of 1905, was a representative of the Bolsheviks in the St. Petersburg Workmen's Soviet and escaped from the capital when the Soviet was arrested. He took part in the Dec. revolt and the fighting on the barricades in Moscow, escaped to Odessa after the failure of that revolt, but presently was again working in Moscow, where he was arrested but once more succeeded in escaping.

In 1907 he was arrested and banished to Samara, but went abroad to visit Lenin. He was arrested on returning and exiled to the province of Archangel for three years. He escaped shortly before the end of his term of exile and went to Paris. He

returned to Russia to organise a congress, was arrested in 1911 and remained in prison till 1913, when in Oct. he was sentenced to exile to the Narym district for four years. In 1914 he escaped, went to Samara, was recaptured and sent back to the Narym district, where he remained until the March revolution of 1917, after which he worked in the Moscow organisation of the Bolsheviks. He took an active part in the Nov. revolution, was for some time president of the supreme economic council, and, after the death of Lenin, became president of the council of people's commissars. He was still occupying this position in 1926.

**SAAR (SARRE) TERRITORY** (*see* SAAR, 23.953), an industrial and mining district situated on the Franco-German frontier, north of Lorraine and near the iron ore deposits of Briey. Its area is 741 sq. m., its population 770,000. The 31 coal mines employ 72,000 men; the 5 iron and steel plants and subsidiary industries a further 32,000. The larger part of this most important district is Prussian, the smaller Bavarian. From Nov. 1918 to Jan. 1920 it was occupied by French troops and administered by a French general.

*Administration under the League of Nations.*—By Section IV. of the Treaty of Versailles (Jan. 10 1920) Germany ceded to France the full and absolute possession of the coal-mines in the Saar basin as compensation for the destruction of the coal-mines in the north of France and as part payment towards the total reparation due from Germany for the damage caused by the War. The district containing the mines was formed into the Saar Territory, of which the frontiers were roughly defined in the Treaty and afterwards to be exactly traced by a commission. This territory, which is not a state, possesses no sovereign rights and has no permanent existence; it is administered by the League of Nations, acting as trustee, for the period 1920–35.

During this period all powers of government formerly possessed by the German Empire, Prussia and Bavaria are ceded by Germany to the League of Nations and exercised by a governing commission of five, to be nominated by and responsible individually and collectively to the League of Nations. One of these five persons must always be a Frenchman, a second always a Saar inhabitant of German nationality; the remaining three members belonging to three countries other than France or Germany. The five are appointed for one year by the Council of the League of Nations, which designates one of them as President. Each member may be reappointed or revoked by the same authority. In view of the dominant French interests, M. Rault, the French member, has held the presidency of the commission from 1920 up to March 31 1926. A consultative council, consisting of 30 members, elected every three years by popular vote of the inhabitants, usually from the local political parties, has been established in an advisory capacity without power of initiative. All new laws and modifications of old ones are submitted to it before being promulgated by the governing commission.

A commission of 9 is nominated by the governing commission and tenders its advice on all problems submitted to it by the commission.

The power of the commission is not sovereign. France owns the mines<sup>1</sup> and the territory is subjected to the French customs régime. France, under the Treaty terms had also the right to use French money in all matters connected with the exploitation of the mines. In fact, the French franc became the only legal currency after June 1 1923. In many other respects, however, the *status quo* under German rule at the time of the Armistice is maintained. The inhabitants retain their local Assemblies, religious liberties, schools, language and nationality. The governing commission administers the following departments: public works, railways, ports, telegraphs, agriculture, social insurance, forests, public instruction, trade and commerce, foreign relations, finance, public welfare and decides all questions arising from the interpretation of the Treaty stipulations which concern the government of the Territory. In 1935 a plebiscite will be held, on the result of which the League of Nations will decide whether the Territory or certain portions of it shall continue to be governed autonomously under the League, be united with France or again be governed by Germany. After 1935 the coal mines may under certain conditions be repurchased by Germany.

<sup>1</sup> The mines now belong to the French State and are under the direct control of the French Minister of Public Works in Paris through an administrative head in Saarbrücken.

*Work of the Commission.*—The work of the governing commission has been exceedingly difficult, and was not accomplished without friction, especially during its opening stages. The first acute problem to arise was that of the status of the local officials. It was decided that they should retain their position as German officials, but pledge fidelity to the new government. Certain disagreements led, however, in July 1920 to an eight days' strike of all officials, which threatened to spread to the coal-mines. It was suppressed by the French military, by courts martial and expulsions. That again raised the question whether the presence of a French garrison was desirable in a plebiscite territory. In fact, the French garrison was subsequently reduced and a local gendarmerie raised. The establishment of a Court of Appeal of mainly neutral composition in June 1920 went some way to quieting apprehensions; another step in this direction was the appointment in Sept. 1922 of a Swiss Commissioner to inquire into and provide for the preservation of the records necessary for drawing up the voting test to be used in the plebiscite of 1935.

In the spring of 1923, when tension between France and Germany was high owing to the occupation of the Ruhr, 75,000 miners struck from Feb. 5 to May 15. A second grave political crisis now arose, especially after the Governing Commission had increased the French garrison and promulgated certain repressive measures (decree of March 7). This decree was severely criticised, both in the meeting of the League of Nations on April 23 and in the British House of Commons in May. The British Govt. declared itself in favour of "an impartial inquiry conducted by the machinery of the League into the question of the general administration of the Saar territory." On Jan. 1 1923 the franc was substituted for the mark as the legal currency.

A public inquiry was conducted by the Council of the League on July 6. The Council found it unnecessary to discuss the Provisional Decree of March 7, as this had already been withdrawn (June 18). It "appreciated the economic considerations" which had led to the change of currency; and declared it desirable that "the support of a foreign garrison should be withdrawn so soon as the development of the local gendarmerie permits." It expressed its "great appreciation of the administrative work achieved by the Governing Commission." The present régime in the Saar Territory is inevitably and *ipso facto* unpopular among the local population. Causes of friction have, however, now been eliminated as far as humanly possible.

Economically, on the other hand, the Saar Territory enjoys considerable advantages. It has no army to support, no reparations to pay, no foreign debt and no war debt. It has always been able to balance its budget out of normal current revenue and the *per capita* taxation on the inhabitants has been low. Unemployment has rarely exceeded 1.5% of the total working population. Exports in 1924 amounted to 1,123,441,499 francs, imports to 874,642,000 francs. In 1913 the annual production of coal was 13,000,000 tons, the coal reserves about 16,000,000,000. Coal production sank in Feb. 1920 to 743,000 tons but rose by Oct. 1923 to 1,223,000 tons. It is thus over the pre-War average. The monthly average production of pig-iron (115,000 tons) and steel (120,000 tons) is also above pre-War figures.

Since Jan. 10 1925, under the Treaty terms, a customs barrier has been imposed between Germany and the Saar, which thereby becomes incorporated within the French Customs régime. This has necessitated finding and developing new markets throughout the world. Future prosperity will be influenced by the terms of an ultimate Trade Agreement between France and Germany.

**SACHAU CARL EDUARD** (1845– ), German scholar, was born July 20 1845 at Neumünster in Holstein. In 1869 he was

appointed Professor of Semitic languages at the University of Vienna, and in 1876 professor of Oriental languages at Berlin, where he became director of the school of Oriental languages. In 1879-80 he travelled extensively in Syria and Mesopotamia, and in 1897-8 in Babylonia and Assyria, for the purposes of study. Sachau was a member of the academies of sciences of Berlin, Vienna, London, Leningrad and Helsingfors.

His chief works are: *Gāwālikt's Almurab* (1867); *Syriaca Inedita* (1870); *Syrisch-römisches Rechtsbuch aus dem 5. Jahrhundert* (1890); *Reise in Syrien und Mesopotamien* (1883); *Neuarabische Volkslieder aus Mesopotamien* (1889); *Katalog persischer Handschriften* (1889); *Muhammedanisches Erbrecht von Zansibar und Ost-Afrika* (1894); *Am Euphrat und Tigris* (1900); *Syrische Rechtsbücher* (1907-14); *Vom Asiatischen Reich der Türkei* (1915). For a complete bibliography of the works of Sachau, see S. Weil, *Die Festschrift zu Ehren Ed. Sachaus*, 1915.

**SAFEGUARDING OF INDUSTRY.**—This is a term which has come into use to designate a policy, entered upon by Great Britain after the World War, of tariff protection to particular industries under certain definitely prescribed conditions. The idea took shape at the Economic Conference of the Allies in Paris in 1916. The first of the resolutions concerning permanent measures, as distinct from war and reconstruction measures, was as follows:—

The Allies decide to take the necessary steps to render themselves independent of the enemy countries in so far as regards the raw materials and manufactured articles essential to the normal development of their economic activities.

The signatories—including, of course, Great Britain—retained complete freedom as to the nature of the measures to be adopted, and expressly added that, in deciding upon them, they would "have regard to the principles which govern their economic policy."

*The Balfour Committee.*—The further consideration of the matter was at once referred by Mr. Asquith, the Prime Minister, to the Committee on Commercial and Industrial Policy after the War, presided over by Lord Balfour of Burleigh. In an interim report in March 1917 it drew a distinction between the great staple industries of the country and those producing "certain special commodities essential to national safety as being absolutely indispensable to important British industries, which were supplied before the War entirely or mainly from present enemy sources or from sources under present enemy control." The report also set forth the position with respect to synthetic dyes, spelter, tungsten, magnetos, optical and chemical glass, hosiery needles, thorium nitrate, gauges and drugs, as pivotal or "key" industries.

The committee presented its final report on Dec. 3 1917, definitely recommending that "some Governmental action should be taken to promote and safeguard the development in the United Kingdom of industries of a special or pivotal character"; and also expressing the opinion that "the producers of this country are entitled to require from the Government that they should be protected in their home market against dumping." Dumping was defined as "the sale of goods at prices lower than those at which the goods are currently offered in the country of manufacture."

No action was taken on these recommendations until Aug. 1921, when the Coalition Govt. secured the passage of the 'Safeguarding of Industries Act, 1921. This dealt, in Part I., with the safeguarding of key industries, and in Part II. with the prevention of dumping, authorising, in each case, a duty of one-third of the value.

Key industries were specified in a schedule to the Act; the Board of Trade was authorised to issue lists in accordance therewith; and complaints as to improper inclusion in, or exclusion from, the lists were to be considered by a referee appointed by the Lord Chancellor. The duration of this part of the Act was for five years. The enactment as to dumping in Part II. was restricted to goods other than articles of food or drink; and dumping was defined by implication as sale "at prices below the cost of production," which was itself defined as "95% of the wholesale price at the works." But under Part II. were now included conditions beyond those contemplated in 1917. The depreciation of the exchanges of continental countries, especially of Germany, had been accompanied by a "lag" between the internal and external value of their currencies, which, so long as

it continued, gave their exports an advantage in foreign markets, thus exposing the home manufactures of those markets to an exceptional but, it might be, ruinous competition.

Accordingly the Act added to the goods with respect to which action could be taken those sold "at prices which, by reason of depreciation in the value in relation to sterling of the currency of the country in which the goods are manufactured (not being a country within His Majesty's dominions) are below the prices at which similar goods can be profitably manufactured in the United Kingdom." On complaint being made to the Board of Trade, the Board must satisfy itself that the value of the currency of the country in question had fallen by at least one-third in relation to sterling. Whether it was alleged that the imports were being "dumped" in the usual sense, or sold cheaply on account of the rate of exchange, the Board was required to satisfy itself that there was a *prima facie* case for maintaining that such imports were seriously affecting employment. It might then refer the complaint to a special committee, selected from a permanent panel mainly of persons of commercial or industrial experience, which was directed to report as to whether the conditions were satisfied; into the effect which the imposition of a duty would exert on any other industry using the goods as materials; and also as to whether the threatened industry in the United Kingdom was being carried on with reasonable economy and efficiency.

If the report was satisfactory, the Board of Trade was given power, but not required, to make an order applying the Act, so long as it was not at variance with any engagement with any foreign state. The draft of the order must, however, be approved by the House of Commons before it became operative. Such an order, unless renewed, would not be valid for more than three years, and if made on the ground of depreciation of currency for more than three years after the passing of the Act.

*Four Classes of Goods Safeguarded.*—Most of the applications received were adversely reported upon; but four having been adjudged to fulfill all the conditions, formed the subjects of a draft order laid before the House of Commons in June 1922, and approved by Resolution of the House at the end of July. In each instance the complaint had been made on the ground of depreciated exchanges. The order applied to four descriptions of goods manufactured in Germany: fabric gloves and glove fabric, domestic glassware, illuminating glassware and domestic hollowware. The case of fabric gloves had previously been referred back to the committee that it might consider the assertion that the Lancashire cotton trade would be injured by the effect which the duty would have on the export of yarn from England, and it had reported, repeating its former recommendation. In the case of glassware, though the report of the committee had included imports from Czechoslovakia, that country had been so successful in stabilising its currency before the order was actually prepared, that the President of the Board of Trade, in the exercise of his discretion under the Act, determined to limit the imposition of duties to imports from Germany. In Oct. 1922 a further order was made with respect to gas mantles from Germany, the complainants having satisfied a committee that the conditions of the Act were in fact satisfied.

The time required by so elaborate a procedure and the limited duration of the promised safeguarding prevented any further action being taken before the fall of the first Baldwin administration at the end of 1923. As to the effect of the orders it is difficult to form any confident opinion, in view of the continuance, outside the particular trades under the Act, of the severe general depression of trade. But there seems reason to believe that in the case of domestic hollowware some improvement was discernible, and that in the other cases the trades were enabled to keep alive, and were saved from the still greater decline they would otherwise have experienced.

*A Change in Procedure.*—On the formation of the second Baldwin administration a new procedure was adopted. The general conditions on which safeguarding duties would be granted were announced on Feb. 3 1925, in a White Paper (Cmd. 2327, 1925), together with the intention of the Government, when a *prima facie* case had been made out and reported on favourably by a special committee, and the imposition of a duty had been concurred in by the Board of Trade and the Treasury, to proceed by the ordinary methods of financial legislation, with all their customary safeguards. To the conditions imposed by the earlier Act were now added (1) that the applicant industry should be "of substantial importance, on account of the volume of

employment or the nature of the goods," and (2) that the competing imports should be "abnormal." The term "dumping" disappeared; and it was now made necessary to prove that the competition came "largely from countries where the conditions are so different . . . as to render it unfair." "Unfairness" was limited to one or more of the following causes:—

(a) Depreciation of currency, operating so as to create an export bounty.

(b) Subsidies, bounties and other artificial advantages.

(c) Inferior conditions of employment of labour.

The special committee in each case might "call attention to any special circumstances by reason of which the industry in the United Kingdom was placed at a serious relative disadvantage." Finally, the committee was called upon, in the event of the claim to a duty being made out, to express its opinion as to the rate of duty which "would be reasonably sufficient to counteract the unfair competition."

The operation of the previous Act had been restricted by existing treaty obligations, and a commercial treaty had recently been made with Germany extending to that country most favoured nation rights. The Government therefore now determined that any safeguarding duties imposed under the new Act should be general in their application and not limited to imports from particular countries.

*Four Further Applications Granted.*—Out of more than a score of applications in the course of the next few months, four succeeded in satisfying the conditions of the Act. The first of these reports, that on lace and embroidery, was in time to be given effect to in the Finance Act 1925, which imposed an import duty of one-third of the value. The other three were given effect to in the Safeguarding of Industries (Customs Duties) Act 1925, which, after long debates, became law on Dec. 22. This imposed for five years a duty of one-third of the value on imports of certain classes of cutlery and on both leather and fabric gloves, and also a specific duty on incandescent mantles. The lace, cutlery and glove trades were deemed important by reason of the volume of employment they provided. The gas mantle industry was considered important in view of its character. During the War it had been discovered that there was vital need in every branch of gunnery of the rare metals thorium and cerium for the manufacture of searchlights, and it was held that the only chance of maintaining the production of these metals was to give those engaged in their extraction the one commercial market furnished by the gas mantle trade.

The report of the committee appointed by the Board of Trade upon:—

(a) The effect of Part I. of the Safeguarding of Industries Act 1921, on the Development of the industries manufacturing the goods covered by the Schedule to that Act.

(b) The question of the Desirability or otherwise of an extension of Part I. of the Act after its expiry on Aug. 19 1926.

(c) The question of the desirability of inclusion within the ambit of the Schedule of any articles or substances not now covered.

was published on April 22 1926 (Cmd. 2631 of 1926). The committee recommended the continuation, and in certain cases, the increase or extension of rates of duty, and the continuation of the safeguarding Duties for a minimum of five years, and preferably ten years.

**BIBLIOGRAPHY.**—*Final Report of the Committee on Commercial and Industrial Policy after the War* (Cd. 9035, 1918); and *Official Reports of Parliamentary Debates* (Hansard's), especially those in the House of Commons (Aug. 11 1921, July 31 1922; and Dec. 9 1925). (Wm. A.)

**SAFETY FIRST.**—The origin of the safety movement or, as it is more popularly called, the Safety First movement, is often disputed. The United States first developed the idea on an organised national basis, but the principles were in practice much earlier in Great Britain and elsewhere. In the middle of the 19th century an association was formed in Manchester to prevent the disasters due to boiler explosions; early in the 20th century certain undertakings, notably Lever Bros., Cadbury Bros. and the Great Western Railway Co., were developing the principle

of educating their employees in the necessity of being on their guard against the risks of modern machinery and high speed transport.

The slogan "safety first" was certainly used on a large scale in America first of all. Its origin lies in an old railway rule "The SAFETY of the public shall be the first consideration of the staff." The slogan caught on, and, though often misinterpreted as implying that all other considerations are of secondary importance, no better substitute has yet been evolved. It is the motto for a movement which aims at educating the community in the common sense principles necessary to cope with the ever-increasing and inevitable risks inseparable from modern conditions. The majority of all accidents should not, and need not, occur.

*Campaign in Great Britain.*—The beginning of the British national campaign was in London in 1916. At an important conference it was decided to form the London Safety First Council to deal with London's street dangers, and this body has been in active existence ever since. Composed of representatives from the various London local authorities, transport and business undertakings, together with experts on traffic matters, it has waged a continuous educative campaign in the London area, particularly in the schools. Nearly 200,000 school children participate annually in its essay competition; over 15,000 motor drivers enter annually for its "freedom from accidents" competition. Over 1,000,000 posters and warnings have been displayed in schools and elsewhere, whilst the chief transport undertakings have supplemented the campaign by additional efforts. It is claimed that, owing to these activities, there are fewer children killed on the London streets than was the case previously; that the rate of increase in London's accidents is less than in the provinces; and that the standard of both drivers' and pedestrians' watchfulness is higher in the metropolis than elsewhere.

*Safety Work in Industry.*—In 1918 attention was directed to the value of accident prevention work in industry, and the British Industrial Safety First Association was formed to deal with this side of the problem. Its gravity is best indicated by the fact that 200,000 more persons were compensated for industrial accidents in the five years following the War than were wounded in the previous five years of War. Members of this Association, who took up organised accident prevention work, found that they were able very materially to reduce the number of their accidents, in some cases by as much as 70 to 80%. These results were achieved by co-operation between employer and employed, and by impressing the necessary common-sense precautions by means of posters and allied measures for interesting and educating the workers.

*A National Campaign.*—The growth of motor traffic, and so the toll of street accidents, which rose from 36,000 in 1918 to well over 100,000 in 1925, directed attention to the need of a general national campaign. In 1924 the British Industrial Safety First Association and the London Safety First Council were merged in a National Safety First Association, and in that year and in 1925, with the support of the great motoring and other organisations, a national campaign was inaugurated. With the co-operation of many local authorities, education committees and chief constables, safety instruction was given in schools; the public were instructed through the medium of the Press, of posters and of the association's journal, *Safety First*, and arrangements were made whereby a pamphlet on safe motoring was issued with every motor driving licence. In eight of the chief provincial centres, branches of the association were formed for the purpose of initiating work on the lines successfully carried out by the London Safety First Council.

*Other Countries.*—Corresponding accident prevention bodies exist, or are in process of formation, in practically all countries. The oldest and most influential is the National Safety Council of America, with a very large membership and field of activity. Other bodies are the Canadian National Safety League, the Industrial Accident Prevention Association of Canada, the Association des Industriels (Accident Prevention) of France, the Association des Industriels (Accident Prevention) of Belgium,

the Associazione degli Industriali (Accident Prevention) of Italy and the National Insurance Institute, Trieste. The International Labour Office at Geneva has a special department dealing with accident prevention. (See INDUSTRIAL WELFARE.)

(J. A. A. P.)

**SAGE, MARGARET OLIVIA SLOCUM** (1828–1918), American philanthropist, was born at Syracuse, N.Y., Sept. 8 1828. After graduating in 1847 from the Troy (N.Y.) Female Seminary, afterwards known as the Emma Willard School, she taught in various schools until 1869, when she became the second wife of Russell Sage (see 23.1002). She proved herself a shrewd business woman and for several years before his death had full control of his affairs. She had long been interested in charities, and he left to her without restriction his entire fortune, over \$64,000,000, doubtless foreseeing its probable final distribution to charity. In 1907 the Russell Sage Foundation was incorporated for the "improvement of social and living conditions of the United States of America," and to it she gave \$10,000,000. In 1912 Mrs. Sage bought Marsh I., off the Louisiana coast, containing about 79,000 ac., later turned over to the state as a permanent refuge for birds. She died in New York City Nov. 4 1918. Her will provided that after bequests to relatives and friends amounting to about \$12,000,000, the residue, some \$36,000,000, should be divided into 52 parts and variously distributed to many colleges, museums, hospitals, charitable institutions, Bible societies and missions. To most of these she had made gifts during her lifetime. The largest portion, seven parts, was left to the Russell Sage Foundation. It was estimated that during her life she had made public gifts of some \$40,000,000.

**SAID HALIM, PRINCE** (1863–1921), Turkish statesman, the son of Halim Pasha and the grandson of Mohammed Ali, the founder of the present Egyptian Dynasty, was born in Cairo and was educated in Turkey, completing his studies in Geneva. Exiled because of his sympathy with the Young Turkish movement, he affiliated himself to the Committee of Union and Progress in Paris. After the revolution of July 1908 he returned to Constantinople and was nominated Senator. At various times from 1908 to 1918 he was President of the Council of State, Minister for Foreign Affairs and general secretary to the Union and Progress party. On June 17 1913 he became Grand Vizier, in which capacity he endeavoured to settle the questions of Armenian reforms, Mosul oil, and the participation of English, French and Russian capital in the Baghdad railway. He also endeavoured to establish close relations with Greece. Prince Said Halim favoured a Turco-German alliance, but sought to keep Turkey neutral in the World War. On her entry into the War he tendered his resignation, which was refused, and he remained in office until Feb. 1917. After the Armistice of Moudros, Oct. 31 1918, Prince Said Halim was imprisoned by the British in Malta. Released in 1921, he was assassinated in Rome on Dec. 6 1921. One of the last representatives of old Turkish Grands Seigneurs, Prince Said Halim was a connoisseur of Oriental as well as Occidental fine arts. He founded the Evkaf for Muslim Arts in Constantinople, and the school for Turkish decorative writing and miniature.

**SAID PASHA, MEHMED** (1838–1914), Turkish statesman, was born at Erzerum, the son of Ali Namik Effendi, formerly chargé d'affaires at Tehran. In 1876 he became first secretary to the Sultan Abdul Hamid II. and afterwards senator. After the Russo-Turkish Peace in 1878, he became minister of justice, and showed energy and initiative in carrying through important legal reforms. In 1879 he was appointed grand vizier, a post which he held nine times in all. In 1881 he established the administration of the public debt, and the tobacco monopoly. In 1885, owing to his having advocated armed intervention to restore the *status quo* in Bulgaria, he was replaced by Kiamil Pasha. At the time of the Armenian massacres he was again in power, but was dismissed in 1895, and was forced to take refuge at the British Embassy. During the revolt of the Young Turks in 1908 he was called on by Abdul Hamid to form a Cabinet, but was unsuccessful in his attempts to defend the old régime. After the revolution he was for some time president of the

Senate, and in 1911 succeeded Hakki Pasha as grand vizier. In 1913 he again became president of the Senate, and died in Constantinople March 1 1914. Said Pasha was a remarkable speaker; and, combining as he did the culture of both East and West, may be considered as one of the most experienced and far-seeing Turkish Ministers of the 19th century. His *Memoirs* in three volumes are a justification of his policy; and an account of his legal reforms will be found in the blue book, *Turkey* (1881, No. 8).

**ST. ALDWYN, MICHAEL EDWARD HICKS-BEACH, 1ST EARL** (1837–1916), British statesman (see 23.1013), was created an earl in 1915. He died in London April 30 1916.

**ST. ANDREWS, UNIVERSITY OF** (see 23.1015).—In St. Andrews, the Chandos chair of medicine has been converted into the chair of physiology and new chairs have been instituted in anatomy and English. In the scientific departments lectureships in various branches have been instituted. The gift, by Prof. Thomas Purdie, of a chemical research laboratory gave a great impetus to research work in chemistry, and Prof. Purdie's widow bequeathed an endowment fund for the fostering of research. The laboratory has played an important part in the development of research. Among the modern additions to the university may be mentioned the establishment of a botanical garden and of the Gatty marine laboratory.

The original scheme of the colleges involved the residence of the students in the college buildings and that system continued till about the beginning of the 19th century. Towards the middle of that century an effort was made to revive this system, which, however, was not maintained. In 1921 a residence for men students was established, and in 1926 a beginning was made with the erection of a residence hall on a more extensive scale. Dr. and Mrs. Younger, of Mount Melville, gave to the university the site and building of a large graduation hall adjoining the united college buildings.

By Mr. Andrew Carnegie gifts were made to the university of a large recreation park with pavilion adjoining, a gymnasium and a very considerable addition to the university library buildings. Mrs. Carnegie gave to the university a building for a women students' union or club house. The men students' union (originated in 1808) has been extended and improved under a gift to the university by Dr. William Low of Blebo. A number of bursaries, scholarships and prizes have been established by the donation of funds to the university, and among other funds is the Lady Donaldson fund for the benefit of students who fall ill during their college course. At University College, Dundee, a chair of bacteriology and a large number of lectureships in various branches of medical science and practice have been established.

To the original buildings of University College, Dundee, have been added a block of medical buildings, an electrical engineering laboratory, a mechanical engineering laboratory, library, fives court and students' union. A hostel for women students has been established in Dundee.

**ST. GERMAIN, TREATY OF** (see also VERSAILLES, TRIANON AND NEUILLY, TREATIES OF).—Austria and Hungary had up to 1918 formed a diplomatic unit; but in Oct. 1918 they were virtually two separate States. The Armistice of Nov. 3 still recognised Austria-Hungary as a diplomatic unit, but Austria was proclaimed a Republic Nov. 12, as was Hungary Nov. 16. The Armistice concluded by the Powers direct with Hungary (Nov. 13) recognised Hungary's *de facto* independence of Austria.

All the Powers, except the United States, early asserted that the "Fourteen Points," etc., did not apply to the settlements with Austria and Hungary. In Jan. 1919 it was known that even Wilson favoured including in Italy part of the Slovene population of Istria and Carniola, and would make Italy further concessions. On April 14 he agreed to grant Italy the Tirol south of the Brenner Pass, with over 250,000 Germans, as well as the Trentino, as already agreed by France and Great Britain. It was known also that the Czechoslovak State would include over 3,000,000 Germans. Austria was to be reduced to some two-thirds of her German-speaking territories. In mid-April

M. Clemenceau obtained from his Allies the further important decision to prohibit union between Austria and Germany without the unanimous consent of the Council of the League. This was embodied in the draft treaty with Germany of May 6, and formed article 80 of the Treaty of Versailles of June 28, appearing as article 88 of the Treaty of Saint-Germain, and Article 72 of the Treaty of Neuilly.

On May 2 the Austrian delegation was invited to Paris. On June 2 they were presented with a very imperfect draft treaty, followed by a more detailed one on July 20. Austria made great protests, turning mainly on two points. She asserted the applicability of the "Fourteen Points" to her case, and her right therefore to retain all her German subjects. President Wilson alone was willing to extend the application of the "Fourteen Points" to Austria; the Treaty assigned 3,500,000 Germans to Czechoslovakia, 230,000 to Italy. The other main point of dispute was how far Austria must accept the responsibilities of old Austria-Hungary. The Allies finally decided that the Austrian Republic was not a new State but an old one lopped of certain outlying provinces and endowed with a new Government. The Allies recognised this Government *de facto* by accepting their credentials on May 22 and *de jure* on Sept. 10, by signing the treaty with them at St. Germain-en-Laye. It came into force on July 16 1920.

*Part I.* The Covenant, and *Part XIII.* Labour, are as in the Treaty of Versailles.

*Part II.* of the Austrian Treaty details the borders of the new Austrian State.

*Part III.* Political clauses for Europe.—This deals with technical details such as the financial obligations of the former Austrian Empire, as affecting Italy, Yugoslavia, Czechoslovakia and Rumania. Articles 49–50 arranged for a plebiscite in two areas of the Klagenfurt basin. This plebiscite, taken in 1920, went in Austria's favour. West Hungary, with about 333,000 souls, was transferred from Hungary to Austria but, ultimately, in 1921, without its chief town (see *BURGENLAND*). Further clauses in *Part III.* dealt with the protection of racial and religious minorities. Article No. 88 prohibits Austria from alienating her independence (*i.e.*, joining Germany) otherwise than with the consent of the Council of the League of Nations.

*Part IV.* Austrian Interests Outside Europe.—As in the Treaty of Versailles this part provides for a total renunciation of State properties immovable and movable outside Europe, and also of treaties, capitulations, concessions, etc., in the following countries: Morocco, Egypt, Siam and China.

*Part V.* Military, Naval and Air Clauses followed the general lines of the similar clauses in the Treaty of Versailles but showed somewhat more consideration to Austria. A long-service voluntary force not exceeding 30,000 was allowed. The manufacture of arms, etc., was confined to a single factory (article 132). The naval clauses were very drastic; the whole Austro-Hungarian Navy was broken up or distributed among the Allies, Austria only retaining four patrol boats on her inland waters. The air clauses were as in the German Treaty.

*Part VI.* Prisoners of War and Graves; *Part XI.* Aerial Navigation, were as in the German Treaty, with a few very small alterations.

*Part VII.* Penalties provided for the trial before Allied military Tribunals of Austrian offenders against the laws and customs of war. This provision was not executed.

*Part VIII.* Reparations; *Part IX.* Financial Clauses; *Part X.* Economic Clauses.—By article 177 Austria accepted responsibility for herself and her Allies for causing loss and damage to the Allied (Entente) Governments by the War. The rest of the "Reparation Chapter" followed the corresponding section in the German Treaty. No lump sum was fixed, but discretion was, in effect, given to the Reparation Commission to fix it. Austria handed over her whole commercial fleet and much livestock to the Allies. Czechoslovakia, Yugoslavia, Poland and Rumania had, however, to contribute to the expenses incurred by the Allies in liberating their territory from Austria. The financial clauses involved many complex questions as to the allocation of pre-War debt and the distribution of war debts. All these provisions were somewhat relaxed by the Supreme Council on March 17 1921, and the process was completed by Austria placing her finances under control of the League in Sept. 1922 (see *Austria*).

*Part XII.* Ports, waterways and railways, merely stressed some points in the corresponding section of the German Treaty.

See *Treaty Series*, No. 11 (Cmd. 400 of 1919); also H. W. V. Temperley (ed.), *A History of the Peace Conference of Paris*, vol. iv. and v. (Institute of International Affairs, London, 1921).

ST. LAWRENCE: see GREAT LAKES AND ST. LAWRENCE; also 24.21.

**ST. LOUIS** (see 24.24).—The population of St. Louis July 1 1925 was 821,543 (census bureau estimate), an increase of 48,545 since 1920. The increase from 1910 to 1920 was 85,868, or 12%. The population figures are for limits fixed in 1876, when St. Louis city and St. Louis county were separated. An amendment (adopted in 1924) to the constitution of Missouri authorises the extension of the city limits into the county if the plan is approved by the voters of both city and county. The city, the counties of St. Louis and St. Charles in Missouri and the counties of St. Clair and Madison in Illinois form the St. Louis industrial district of the U.S. census.

The city charter of 1914 reduced elective officers to mayor, comptroller, president and board of aldermen, collector, treasurer, recorder of deeds, sheriff and coroner with four-year terms. Each of 28 wards has a resident alderman elected by citywide vote. The mayor, the comptroller and the president of the board of aldermen form a board of estimate and apportionment with control of appropriations. The board of public service (appointive) consists of a president and four directors of divisions—public welfare, public safety, public utilities, and streets and sewers, with departments and bureaus under them. The tax rate of 1925 was \$2.57 per \$100 assessment. Assessed valuation of realty, personalty and utilities increased from \$775,500,000 in 1921 to \$1,075,509,930 for the taxes of 1925.

*City Improvement Plan.*—In 1923 St. Louis voted \$87,000,000 in bonds for a great scheme of city improvement. The bonds provided \$8,500,000 for widening and \$5,800,000 for improving 69 m. of streets; \$12,000,000 for waterworks on the Missouri river, doubling the present supply of water taken from the Mississippi; \$11,000,000 to put underground the River des Pères in the western suburbs; \$2,600,000 for a plaza and park fronting Union station; \$2,500,000 for new parks and playgrounds, with \$1,300,000 for improving old ones; \$8,000,000 for city-wide electric lighting; \$8,000,000 for reconstruction of sewers; \$400,000 for an aquarium; \$4,000,000 for eleemosynary institutions; and \$1,250,000 for city markets. The bonds voted provide also \$5,000,000 for a memorial plaza occupying 9 city blocks (27 ac.) between Market and Olive streets, west of Twelfth street boulevard. The new buildings on the plaza will be a courthouse, \$4,000,000; and auditorium and convention hall, \$5,000,000; and a World War memorial, \$1,000,000. Existing public buildings in the plaza group include the municipal courts, the city hall and the public library.

Municipal improvements accomplished since 1910 include a permanent open-air theatre in Forest Park with seats for 9,275; a free steel bridge costing \$7,500,000; viaducts over railways, \$700,000; and new school buildings, \$5,000,000. Additions to Washington University were endowment gifts (\$1,500,000) and new buildings for the medical, art, biological and other departments, costing \$3,000,000. To St. Louis University James Campbell left an estate of \$10,000,000 for a hospital and the advancement of medicine and surgery. Three new hospitals—Barnes, the Jewish and the Children's—represent, with endowments, \$5,000,000. From the surplus of the Louisiana purchase exposition the Jefferson memorial was built, costing \$500,000, for the Missouri Historical Society.

*Trade and Industry.*—The total resources of banks and trust companies in 1925 were \$523,114,561; deposits, \$536,701,672; capital stock \$42,950,000. Clearings for 1924 were \$7,174,034,000. In 1925 St. Louis industries included the largest plants in the United States for the manufacture of shoes, street cars, stamped ware, stoves and ranges, drugs, tobacco, lead and brick. Operating 11 tanneries and 40 factories, the leading shoe company reached a production of 150,000 pairs daily in 1925. Recent development in metals has been marked, giving St. Louis the largest steel-casting plant in the world. An industrial district employing 55,000 has developed in northwest St. Louis since 1915. Rail freight tonnage received increased from 43,000,000 in 1920 to 52,000,000 in 1923; shipments out increased from 29,000,000 to 35,000,000 in the same years. Receipts of grain in 1924 were 113,974,000 bushels. Receipts of hogs in 1923 were 4,800,000.

(W. B. St.)

**ST. MIHIEL, BATTLE OF.**—For four years the St. Mihiel salient had projected 28 km. deep into the French lines. Its original purpose, to serve as one of the jaws of a nutcracker attack on Verdun having failed, it was used in 1916 as the anvil against which Von Falkenhayn sought in vain to drive home his hammer blows against Verdun from the north. In the spring of 1918 Ludendorff again hoped through its possession to gain Verdun, and much more by the wider encircling attack in Champagne of July 15, but again the attack failed. During all these years the salient had been not only a threat of further German aggression but a serious interruption of French railway communication with both the Verdun and Lorraine front. In 1915 the French Army had twice attacked to compel evacuation of the salient, but both attacks had failed, the first, made in April at Les Eparges, with serious losses. Tactically the salient afforded the Germans a strong defensive position. The Côte de Meuse, a range of hills rising abruptly 1,600 ft. above the Meuse valley, afforded strong supporting points on the western face of the salient, while Mont Sec and the lower-lying hills south of the Rupt de Mad were well adapted to a strong defensive organisation (see WESTERN FRONT CAMPAIGNS).

*The Attack Assigned to the A.E.F.*—To the General Staff of the American Expeditionary Forces, even before its arrival in France, the reduction of the St. Mihiel salient had appealed strongly as a favourable initial operation for the American Army as soon as sufficient forces should have arrived to undertake it. The reason for this selection was in part that the nature of the salient enabled an offensive to be undertaken there with relatively small forces such as the A.E.F. might hope to have by the following spring, but mainly because at this point the eventually preponderant American forces could strike a most serious blow by the capture of Metz, which was not only important as a railway centre, but the heart of a vital industrial region. The staff further deemed it important to begin at once the installations and lines of communication necessary for both the reduction of the salient and the subsequent operations.

Gen. Pershing discussed this view with Gen. Pétain in June 1917, and, after a further study of the front, port facilities and railway lines, it had been adopted as a working plan. However, the success of the German offensive operations in the spring of 1918 caused the plan temporarily to be laid aside, and during both the spring and summer of that year American troops in France were scattered along the Western Front to meet needs of the moment. By the end of July the situation had stabilised sufficiently in favour of the Allies to enable the question of reuniting the troops of the American Army to be again discussed. On July 24 Foch confirmed the understanding arrived at the previous year that the first independent American operation should be the reduction of the St. Mihiel salient. A few weeks later he authorised the transfer to the American I. Army of the sector of the Allied front facing the salient. This transfer was made on Aug. 30.

*The Allied Plan.*—By this time the American Army consisted of forces far beyond the number required for the mere reduction of the salient, and the question of their subsequent employment had to be considered. Pershing had naturally desired to exploit the St. Mihiel attack to the utmost. Foch, with other plans in mind, limited the attack strictly to the reduction of the salient.

By Foch's direction, Pétain on Sept. 2 issued the directive for the operation, which called for a main attack on the south to debouch from the plateau Seicheprey-Limey toward the objective Vigneulles-Thiaucourt, and a secondary attack, to debouch from the vicinity of Eparges-Mouilly toward the southeast and, in connection with the main attack, to effect the cutting off of the German forces in the salient. To the main attack there were assigned eight American divisions; to the secondary, one American and one French; the French troops occupying the intermediate sector were to exercise pressure against the enemy forces in the apex. The wording and date of this directive and the disproportionate number of American divisions assigned to the main attack, which alone could hope speedily to reach the *Michel Stellung*, across the mouth of the salient, suggest that it was

originally drafted with a view to at least a partial exploitation of the attack, to include the seizure of the *Michel Stellung*, but that in a subsequent alteration, to conform to Foch's insistence on a more limited scope to the attack, only the names of the objectives were changed.

*Dispositions of the Opposing Forces.*—Gen. Pershing's order for the attack assigned the main attack to the I. and IV. Corps, each of which were given four divisions, including two regular divisions, and the secondary attack on the Côte de Meuse, to the V. Corps, the attacking troops of which consisted of one American National Guard Div. and one French division; the French II. Colonial Corps in the centre was to guard the adjacent flanks of the main and secondary attacks, to execute deep raids, and to be prepared to follow up a withdrawal. At the disposal of the American I. Army for the operation were 2,971 guns, mostly French artillery. The I. Army also had a marked superiority in aviation, thanks to French co-operation and the assistance of the British Independent Air Force.

On the German side the salient was held by Army Detachment C, under Gen. Fuchs, comprising eight divisions on the line, organised into three corps groups, and three divisions in reserve. As early as Sept. 1 a deserter had given the Germans warning of the impending attack, and Ludendorff had at the time seriously considered ordering a withdrawal from the salient, but was deterred by the representations of the army detachment and army group commanders, who were confident of their ability to hold. By Sept. 8, however, the evidences of the coming attack on the salient had become unmistakable, and Army Detachment C was ordered to withdraw to the *Michel Stellung*. No need for haste was felt and the preparations were deliberate and methodical. The night preceding the attack the dismounted batteries were being withdrawn, and consequently could not be used in the battle.

*Launching of the Attack.*—Preceded by a four-hour bombardment the main attack was launched at 5 A.M. on Sept. 12; the secondary attack at 8 A.M. Deprived of most of its artillery support the German infantry, although ordered to hold, made virtually no resistance. The American I. Army on the right made its objectives in a few hours and, in spite of German counter-attacks brought by two of the divisions in reserve, begged permission to continue its advance; but, because of the precise instructions by which Pershing felt himself bound, this permission was refused. The IV. and V. Corps also made at an early hour their first-day objectives and halted awaiting further orders. Instructions were at once dispatched for the two corps to join hands at Vigneulles to cut off the apex of the salient. These instructions did not reach the troops until after dark on the 12th, so that the connection, though unopposed, was not effected until the morning of the 13th. Meanwhile the German commander had ordered the complete evacuation of the salient, which had not been attacked from the front, and the movement was successfully carried out during the night.

In the course of Sept. 13 and 14 troops of the American IV. and V. Corps and French II. Colonial Corps moved forward without opposition to the line designated by Foch, facing the *Michel Stellung*, which the I. Corps had already reached on the 12th. Of the troops engaged on the Allied side 555,000 were American, and 110,000 were French. American losses were 7,511, of which considerably more than half were borne by the I. Corps, which received the brunt of the counter-attack; French losses were 597. The captures included over 15,000 prisoners and 443 guns.

(A. L. C.)

**ST. PAUL, Minnesota, U.S.A.** (see 24.35), had in 1920 a population of 234,698, of whom 51,722 were foreign-born (Swedes and Germans predominating) and 3,376 were negroes. The census bureau estimate for 1925 was 246,001. Bank clearings increased from \$538,600,000 in 1910 to \$1,659,900,000 in 1924.

The factory output was valued at \$58,990,000 in 1906; \$149,638,000 in 1919; and about the same in 1923 (\$150,355,075), representing recovery after the depression of 1920-1. Building permits in the five years 1920-4 represented new construction valued at \$96,691,000.

A new charter establishing a commission form of government was adopted in 1912 (in effect Jan. 1 1914). In 1921 a proposal to change back to the federal form was defeated at the polls. The City Planning Board (created by an ordinance of 1918) submitted in 1922 a city plan with many interesting features, including suitable approaches to the state capitol (based on the suggestions made by the architect of the building, Cass Gilbert, in 1905, when it was completed) and to the new union dépôt, and designs for a city and county administration building. A zoning ordinance was adopted in 1924. The desirability of a metropolitan planning commission for the Twin Cities and their environs was under discussion. The Amherst H. Wilder Charity (incorporated 1910, with an endowment of \$2,778,018) erected an administration building (1913) which became a central "charities building" for the city, where other agencies are housed without charge for rent; it made surveys of housing conditions (1917) and of health (1919) besides establishing a day nursery, public baths, etc. St. Paul, like Minneapolis, has a low general death rate, a low infant mortality and relatively little child labour and illiteracy; its percentage of home ownership is appreciably higher.

**ST. PETERSBURG:** see PETROGRAD.

**ST. QUENTIN, BATTLE OF:** see GERMAN OFFENSIVE.

**SAINT-SAËNS, CHARLES CAMILLE** (1835-1921), French musical composer (see 24.44), died in Algiers Dec. 16 1921.

**SAIONZI, KIMMOCHI, PRINCE** (1849- ), Japanese statesman, was born in Oct. 1849 at Kyoto. When less than 20 years of age, he took part in the councils which led to the Restoration, and at 19 was commander-in-chief of an imperial army. In 1881 he commenced his official career, and in the following year accompanied Mr. (afterwards Prince) Ito to Europe and the United States to investigate the parliamentary system. In 1885 he was appointed minister to Austria; three years later he became vice-president of the house of peers and was raised to the privy council in 1894. In the same year he received the portfolio of education in the second Ito Cabinet. In July 1903 he became the leader of the Seiyu-Kai and in 1906 formed his first Cabinet as prime minister; he was again premier in 1911 to 1912. In 1919 he represented Japan as chief envoy at the Peace Conference and was invested with the Grand Order of Merit. He was made Prince in 1920 in recognition of his services in connection with the World War and the Peace Conference.

**SAITO, MINORU, VISCOUNT** (1858- ), Japanese sailor and administrator, was born a commoner, at Iwata Ken. He joined the navy in 1873, and proceeded steadily towards the highest advancement, being gazetted commander in 1897. The discipline of the Japanese navy, strict as it was, still left something to be desired, and when he became captain in 1898, Saito declared his intention of revising some of the existing regulations and enforcing a stricter observance of others. In the same year he was appointed vice-minister of the navy under Adml. Count Yamamoto. Two years later he was gazetted rear-admiral in recognition of his valuable services in the development of the navy along Western lines. He was promoted to vice-adml. in 1904 and became adml. in 1912. He received several decorations for his services in the Russo-Japanese war, where he profited by his experience as naval aide-de-camp to the Emperor in the Chino-Japanese conflict. He was Minister for the Navy in 1913 and 1914. After the upheaval of Koreans in 1919 under the rule of Marshal Hasegawa, Baron Saito was appointed governor-general of Korea. His chief concern was education; there were only 250 schools in the peninsula at the time of his appointment, but by 1926, there were nearly five times that number. He was created Baron in 1907, and was raised to the rank of Viscount in 1925.

**SAKHALIN** or **SAGHALIEN** (see 24.54), a Pacific island, area 24,560 square miles. In Oct. 1905 Russia ceded to Japan that por-

tion of the island lying south of the parallel of 50° N. lat., known officially as Karafuto, with an area of 13,158 sq. m. and population (1920) 105,899. Sakhalin contains important coal-fields, the three exploited in 1925 producing about 114,000 tons annually; iron pyrites in the Notozoro peninsula; alluvial gold in the river beds; and oil-bearing strata which were first discovered in large areas in Anshi and Notosanu in 1913.

*Natural Resources of Karafuto.*—In Karafuto the chief industry is that of the fisheries. About 43,000 ac. of land were under cultivation in 1922, the main crops being barley and wheat. About 900,000 ac. suitable for cultivation and pasturage were still available. There were over 8,000,000 ac. of practically untouched forest. The wood-pulp manufacturing industry was growing. The Japanese treasury makes a fixed annual grant to supplement taxes and sources of revenue. The budget for 1924-5 balanced at 19,948,463 yen.

**SALANDRA, ANTONIO** (1853- ), Italian statesman, was born at Troia, Puglia, in 1853. He first entered parliament as member for Lucera, and from the beginning of his political career was a Liberal of the Right wing. When Baron Sonnino became Treasury Minister in the Crispi Cabinet of 1893, Salandra was chosen under-secretary in that department. He was Minister of Finance in the first Sonnino Cabinet of 1906 and Treasury Minister in the second (1909-10). When in March 1914 Sig. Giolitti resigned, Sig. Salandra was called upon to form the new Cabinet, and he was premier on the outbreak of the World War. It was the Salandra Cabinet which took the momentous decision of bringing Italy into the World War on the side of the Allies. On resigning office in June 1916, he continued to support both the Boselli and the Orlando Cabinets. During the disturbed period from 1919 to 1922 Salandra upheld the principles of orthodox Liberalism, and opposed the policy of the various cabinets who truckled to the extremists. He succeeded Senator Tittoni as Italian delegate on the League of Nations Council and Assembly, and represented the Italian thesis in the Italo-Greek conflict arising from the massacre of the Tellini mission in Epirus in Aug. 1923. The Fascist movement was supported from the first by Sig. Salandra, but he did not join the Fascist party, and when he felt that Fascism was incompatible with the old Liberal tradition, especially after Mussolini's speech of Jan. 3 1925, he withdrew his support, without, however, abandoning the Chamber.

**SALFORD, England** (see 24.67), with an area of 5,202 ac., including Pendleton and Broughton, incorporated in 1919, had a population in 1921 of 234,045. Suggestions for its amalgamation with Manchester, or for the inclusion of Eccles, Swinton and Pendlebury in Salford have not come to fruition. Large clearances of insanitary and overcrowded areas have been made, and the death-rate has fallen to about 13 per 1,000. A wide new road was opened at Pendleton in 1925, and further road improvements were under consideration in 1926. There are 297 ac. of parks and recreation grounds in the borough; these include 46 ac. at Pendleton, bought before the War and laid out after it; Langworthy Park, Pendleton (6 ac.); Wallnes Lane, Salford (12 ac.); an extension of Peel Park; and the Light Oaks Estate, Pendleton. The power station at Agecroft, one of the largest in the country, was finished in 1925. The Salford War memorial ward at the royal hospital was opened in 1922.

**SALISBURY, JAMES EDWARD HUBERT GASCOYNE-CECIL, 4TH MARQUESS OF** (1861- ), British politician, eldest son of the 3rd marquess, the Prime Minister (see 24.76), was educated at Eton and University College, Oxford. He was a member of Parliament from 1885, with the exception of one year, till he succeeded his father in 1903. He fought in the South African War with the 4th battalion of the Bedfordshire regiment, and was mentioned in dispatches. On his return to England in 1900 he became under-secretary for foreign affairs, a post which, on succeeding to the peerage, he quitted for that of Privy Seal in the Cabinet of his cousin, Mr. Balfour; and he held, for some months in 1905, the Presidency of the Board of Trade.

Lord Salisbury, who had not made his mark in the Commons, gradually came to occupy a position of considerable authority in

the Lords. In the crisis over the Parliament Bill he threw in his lot with the "Die-hards." During the early years of the World War he was energetic in the discharge of his military duties as lieutenant-colonel of his yeomanry regiment. He did not join either Coalition government, but was critical of both, taking an independent line. In the last months of the War and during the early years of peace he gradually came to assume the informal leadership of the Conservative Opposition first in the House of Lords, and afterwards in the party generally. As the reluctance of the Conservatives to support the Coalition grew, the discontented rallied round him; and, in a speech on Oct. 16 1922, he categorically demanded the freedom of the party. Three days later the policy was accepted at the Carlton Club meeting. He became Lord President of the Council in Mr. Law's Cabinet and continued in the same post in Mr. Baldwin's first Cabinet. In Mr. Baldwin's second Cabinet he was Lord Privy Seal, and on Lord Curzon's death in 1925 he succeeded to the leadership of the House of Lords. He married in 1887 Lady Cicely Alice Gore, daughter of the 5th Earl of Arran, and had two sons and two daughters. He was created K.G. in 1917.

**SALISBURY**, Rhodesia, the capital of Southern Rhodesia (see 23.260), lies 374 m. northwest of Beira and 301 m. north-east of Bulawayo. In 1921 the white population was 6,462. Situated at an altitude of 4,700 ft. above sea level and at the foot of a kopje, the town is well laid out, has many handsome public buildings and possesses nearly all the amenities of a European town. There is an excellent water supply. Government House, at the northeast end of the town, a large single-storey building, dates from 1910. The churches include an Anglican Cathedral (not completed in 1926). The private residences are mostly of the bungalow type set in large gardens. Salisbury is the centre for a large mining and agricultural district. The Jesuit Industrial Mission Farm at Chishawasha, 16 m. distant, is noted. The first parliament of Southern Rhodesia met here in 1923.

**SALMON FISHING:** see ANGLING.

**SALONIKA** (see 24.85), a seaport of southeastern Europe. When the first Balkan War broke out in 1912, Salonika surrendered to the Greeks on the festival of its patron, St. Demetrios, Nov. 8, after 482 years of Turkish occupation. King George I. proceeded to what was now the second largest city of his kingdom, but was assassinated there on March 18 1913, by a Greek, named Schinàs, to whom he had once refused money.

The Treaty of London of May 30 1913 assigned Salonika to Greece, and the battle of Kilikis in the second Balkan War of that year prevented the Bulgarians from approaching it. Salonika was becoming more and more hellenised when the World War brought it into prominence as the base of the Allied operations in the Near East. On Oct. 5 1915, despite a merely formal protest from M. Veniselos, then premier, allied troops landed there and a few days later Gen. Sarraill arrived and subsequently took over the duties of commander-in-chief. The War Council of the Allies decided to hold it, and held it was, despite several air raids. The Allies arrested and deported the four enemy consuls, occupied all official buildings and proclaimed martial law.

In 1916 a Veniselist revolution against King Constantine broke out there, and on Oct. 9 M. Veniselos arrived and formed a Provisional Govt., which the Allies recognised, and to which Lord Granville was accredited as British representative. From Salonika this National Govt. declared war on Nov. 23 against Bulgaria and Germany. On Aug. 18 1917 a great fire destroyed a large part of the city, including the ancient church of St. Demetrios. After the War an arrangement was made, by which Yugoslavia, now only three hours distant by rail, should have a so-called "Serbian Zone" in the harbour. But the question of the railway from Salonika to the frontier at Gjevgjelija was one of the obstacles to the renewal of the Greco-Yugoslav Alliance. After the proclamation of the Greek Republic, Salonika, as an important military centre, often had a decisive voice in politics, and the large immigration of Greek

refugees from Asia Minor has further hellenised the country round it, now 90% Greek. Salonika is rapidly becoming a great modern city, and it is proposed to endow it with a university. The population at the last census was 174,390, but it is now much larger.

(W. M.)

**SALONIKA CAMPAIGNS 1915-8.**—Under the heading of **SERBIAN CAMPAIGNS** the collapse and subjugation of Serbia in 1915 is related in this work. The present article describes the campaigns in Salonika which formed the sequel to this Allied disaster. The narrative is presented in four sections, under the headings: I. Objects of the expedition; II. The retreat to Salonika; III. The first and second Allied offensives; IV. The defeat of Bulgaria.

## I. OBJECTS OF THE EXPEDITION

Although undertaken for political objects—to bring relief to a hard-pressed ally and to check the influence of Germany in the Balkans—the Salonika campaigns were ultimately crowned by the first decisive military success of the World War. For on the Macedonian front the continent-wide trench barriers of the Central Powers were first breached beyond repair, and there too was knocked away the first national prop—Bulgaria—of the Germanic alliance. To disentangle cause from effect is difficult where moral, military and economic threads are so closely interwoven as in the years 1914-8, yet the fact at least stands out that the overthrow of Bulgaria began the series of national capitulations which ended with that of Germany on Nov. 11 1918.

If Salonika was for several years an unproductive field of military effort, an infringement of the law of economy of force, which in some measure justified the German gibe that it was their largest concentration camp—"an enemy army, prisoner of itself"—the historian, when weighing his verdict, must throw the counterpoise of 1918 into the scales. And not this only, for it must be remembered that the Allied occupation of the Salonika front made possible the rebuilding of the Serbian Army—from the ragged and disorganised survivors of the 1915 winter retreat through Albania to the well-equipped and irresistible force which broke through the Vardar front in Sept. 1918. On the credit side also must be set the fact that the Salonika expedition prevented the danger that Greece might become a submarine base for the Central Powers, one which would have lain in deadly proximity to the British artery of communication with the East via the Suez Canal. And again, that the Allied force contained the bulk of the Bulgarian Army—although it is perhaps doubtful whether these would have placed their services at Germany's disposal for any front more remote from their homeland.

**Origins.**—If the Salonika expedition was the direct outcome of the Serbian débâcle of Sept.-Oct. 1915, the idea had an earlier origin: For Salonika was not only the one feasible channel of Allied communication with and supply to Serbia, but that front offered a possible strategic flank for attack once the trench line on the western front had been welded into a seemingly impenetrable barrier. As far back as 1914, British and French naval missions, with guns, had been sent to support the Serbians, and they had also been supplied with munitions by the Salonika route. The question, too, had been mooted of a larger employment of military force in that theatre, but British commitments at Gallipoli led to this project being shelved—until the Bulgarian mobilisation for war on the side of the Central Powers.

**Bulgarian Intervention.**—Throughout the summer of 1915 the two warring coalitions had been bidding for Bulgaria's support, and in this diplomatic bargaining the Entente suffered a moral and a material handicap—the first, their obvious failure at the Dardanelles; the second, Serbia's reluctance to concede any part of Bulgarian Macedonia, which she had seized as her share of the spoils of the second Balkan war of 1913. As this was the one prize on which the Bulgarians had set their heart, and as Austria had nothing to deter her from offering territory that belonged to her enemy—Serbia—the Entente offers failed to attract Bulgaria. Her intervention on the opposite side meant that free communi-

cation could be easily established between Germany and Turkey, and as a consequence that the Entente forces on the Gallipoli peninsula were imminently menaced.

## II. THE RETREAT TO SALONIKA

Faced with this critical situation, the French and British Govts. decided, albeit tardily, to succour Serbia with an expeditionary force.

*Allied Expeditionary Force.*—The French took the lead, nominating as commander Gen. Sarrail, the former chief of the III. Army in the Verdun sector. Sarrail's political activities had earned him the distrust of the military authorities; but the same factor, through his influence with the parties of the Left, made it difficult to ignore him completely. His removal by Joffre from the III. Army command placed the Government in a temporary dilemma, and they eagerly seized the opportunity of placating Sarrail and his political supporters by appointing him to a conveniently distant theatre of war.

While the constitution of Sarrail's force was still under discussion, the Bulgarian mobilisation on Sept. 22 forced the hands of the Entente Governments. A hurried order was sent for the dispatch to Salonika of contingents from Gallipoli, preliminary to the arrival of reinforcements from France. Preceded by staff officers, the British 10th and French 156th Divs. began to disembark at Salonika on Oct. 5, and they were followed by the French 57th Division. On the same day, however, the Greek promise of aid to Serbia, made by M. Veniselos, was repudiated by King Constantine, and the Veniselist Govt. fell—to be replaced by that of M. Zaimis, which took neutrality as its keynote. This reacted at once not only on the Franco-British plan but on their operations: The Greek officials, civil and military, at Salonika did their best, or worst, to obstruct the disembarkation of the Allied contingents.

To increase the confusion, the intended concentration point was several times changed by successive orders from Paris until, on Sarrail's arrival on Oct. 12, he decided, in view of his slender resources and the doubtful attitude of the Greek Army in his rear, to concentrate no further forward than the Demir Kapu (Demir Kapija) defile. The limited object was to protect the railway and to ease the pressure on the Serbian forces to the north by repelling a Bulgarian advance from Strumitsa (Strumica)—which would sever that line and so the Serbian line of retreat. Meanwhile, the British troops under Gen. Mahon began moving up to Doiran, in echelon behind the right of the French.

*The Retreat.*—On Oct. 14 the leading French troops came into action at Strumitsa station (in Serbia), driving back a Bulgarian reconnaissance, and on Oct. 17, in response to Serbian urgings, a brigade was sent forward beyond the Demir Kapu defile as far as Krivolak. Reinforced by the arrival of the French 122nd Div. Sarrail began, on Nov. 3, an offensive northward to facilitate the Serbian retreat. But the seizure of the Babuna pass by the Bulgarians closed the channel of southward retreat for the main Serbian Army, and finally shattered the hope that the Serbians might fall back on the relieving force, as was the advice of their allies.

Sarrail was thus faced with a difficult problem. On the one hand the gallant French efforts to break through towards the Babuna had failed and they were forced on the defensive, and, on the other, he received news of the Serbian decision to retreat westward through Albania towards the Adriatic. With his small force thus isolated he took the only possible decision—to fall back towards Salonika. This decision raised further problems. Were they to hold on there, or evacuate Greek soil altogether? With the disappearance of Serbia beneath the enemy flood, the Entente Powers could no longer claim that they were at Salonika merely to use a line of communication to which Serbia was by treaty entitled. The other justification, that they had come at the request of the Greek Govt. was now nullified by the downfall of Veniselos. Considerations of prestige and their desire to use Salonika as a base for diplomatic operations in the Balkans led the Entente Govts. to remain, but without any clear policy as to the future.

Even with the decision to retreat taken, the Franco-British forces were not "out of the wood." The withdrawal had to be made down a single-track railway, through a country without roads—converted by the autumn rains into a swamp—and in face of a pursuing enemy. The retreat was made by echelons, in four stages, and only by a narrow margin did the French frustrate Bulgarian efforts to outflank and cut their retreat, first at the Demir Kapu defile, and again at Strumitsa station. The British, too, on the right were heavily attacked, and any weakening might have been fatal to the extrication of the Allied forces from the noose into which they had been pushed.

Fortunately, once the Greek frontier was regained the pursuit halted—mainly because the Germans were reluctant to undertake further commitments in the Balkans to the detriment of their strength in other theatres. Falkenhayn held that the Macedonian operations should be left to the Bulgarians, but this policy

overlooked the fact that the Greeks, however friendly to the Germans, would have resented any invasion of their territory by the Bulgarians. Thus by Dec. 12 the retreating forces were safely out of reach of their pursuers, facing them across the frontier. After pausing for a few days on a line stretching roughly from Sorovičevo to Lake Doiran, the withdrawal was resumed, and by Dec. 18 the forces of Sarrail and Mahon were back in the vicinity of Salonika. Covering this base an entrenched line was constructed, on an 80 m. arc stretching from the mouth of the Vardar through Doganji to the Gulf of Orfano, and occupied early in the new year.

*Allied Reinforcements Arrive.*—The delay in the expected enemy offensive enabled the Entente force to receive reinforcements, not only French and British but Serbian, for the remnant of their army, after resting and being re-equipped at Corfu, was brought round to Salonika. From April onwards the stream steadily swelled until by July their strength on the Salonika front reached a total of 152,000, divided into three armies of two divisions each. The French had four divisions. The British had been raised to five divisions (10th, 22nd, 26th, 27th, 28th), and later a sixth (60th), organised in two army corps; in May Lt.-Gen. G. F. (later Sir George) Milne took over command as general officer commanding British Salonika Force. The total allied force was thus a little over 300,000 men. Opposing it early in 1916 were the Bulgarian I. and II. Armies and the German XI. Army—a total of some 280,000 men—aligned on a front from Lake Okhrida on the west to the point where the Struma enters Bulgaria on the east. But from March onwards the drain on the German forces at Verdun led Falkenhayn to withdraw the German troops, all but one division; by 1918 the XI. Army, though German in name and in staff, contained only one complete German battalion.

On the Entente side the reaction of Verdun took the form of orders from Joffre to Sarrail to pin down the enemy on his front, in order if possible to prevent Falkenhayn drawing upon the forces there. Accordingly the French moved out west of the Vardar towards Vodena and the British advanced north to Kukus. This advance although it lengthened the front to be defended and the lines of communication was of essential value for the security of the Allied force, for the entrenched position at Salonika itself was dominated from the mountains east of the town, and might become untenable if these heights were occupied by the enemy. But in how small degree the Allied advance fixed the Germans can be gauged from the previous paragraph, and Sarrail, who had been placed under Joffre's supreme command in Dec., received instructions to act more vigorously and prepare a definite offensive in conjunction with the anticipated entry into the war of Rumania.

*Effect of the Action of Greece.*—Meantime, however, the situation was complicated by a Greek incident; from now on until 1918 politics were to play a larger part in the Macedonian theatre than warfare. The neutral Greek forces, five corps, were distributed throughout the region, in theory to guard the frontier; and such a situation, while Gilbertian in its absurdity to the distant observer, was a source of serious anxiety to the Franco-British forces on the spot. Feeling that they would be safer without such dubious protection, they brought diplomatic pressure to bear on the Greek Govt. for the withdrawal of the Greek forces from Macedonia and their demobilisation. Reluctantly the Greeks complied, but while the Allies occupied certain of their forts the Bulgarians seized the opportunity to cross the frontier, and appeared before Fort Rupel, which commanded the Struma gate into the Macedonian plain. The Greek commander thereupon handed over the fort to them (May 26).

This unfriendly act bared the eastern flank of the Entente Army, and gave the whole of Eastern Macedonia into the hands of the enemy. To meet the danger the British occupied the Struma line in force. Further, the Entente Govts. instituted an economic blockade of the Greek coast, sent a brigade to Athens, and by the ultimatum of June 21 enforced the demobilisation of the Greek Army and the resignation of the Government. As it proved, however, the seizure of Rupel and Eastern Macedonia

did not develop into a general offensive by the German-Bulgarian forces.

*Problems Facing the Expeditionary Force.*—While these external troubles with Greece beset the Entente Powers, they were far from the sum of the handicaps which hindered effective action by the Salonika force. The idea of an offensive was constantly discussed between the French and British Govts., as also between Joffre and Sarrail; but, apart from reluctance to provide adequate forces, it depended on too many contingencies, in particular the uncertain and often postponed intervention of Rumania. Furthermore the internal troubles of the Salonika force were notorious. Sarrail had the title of "Commander-in-chief of the Allied Armies in the Orient," and with him Cordonnier commanded the French forces; but his status was a nebulous one. Not only was the British commander to all intents independent, but also the Italian—a detachment arrived from Italy in Aug. 1916.

Apart from the defect that Sarrail's orders were issued from French headquarters without consultation with the other Allied Powers, Sarrail's own personality was not such as to weld this loose understanding into an effective co-operation. In a heterogeneous force, composed of French, British, Italians, Serbians and Russians, it was hardly a recommendation that the chief commander should be known not to have the confidence of his own supreme command, and that even the suspicion should exist that he was conducting operations with one eye on the political game at home. The British, by polite but firm insistence on their independence, maintained tranquil relations; wrangles and disputes between the other Allied commands were continual, and the majority were unfortunately attributable to the policy or tactlessness of Sarrail.

*The Bulgarian Attack.*—While the Allies were still debating, the opposing armies moved, on Aug. 17, to forestall and dislocate the Allied offensive, which they judged would synchronise with Rumania's intervention. The Bulgarians made their effort on the two wings. The eastern wing from Rupel drove back the French cavalry on the east of the Struma and pressed down towards its mouth. But they dissipated their force by detaching part to seize the coastal strip of Kavalla, and the stout resistance of the British prevented them forcing the river line. On the western wing the position was more critical, for the Bulgarian advance from the Monastir area drove the Serbs out of Florina and reached Lake Ostrovo before they were ultimately held.

### III. THE FIRST AND SECOND ALLIED OFFENSIVES

These reverses caused a further change in Sarrail's plan for the Allied offensive; the forces east of the Vardar were merely to contain the enemy, while those west of the Vardar carried out the offensive. Thus to all intents it became no more than a counter-offensive to restore the impaired situation in this sector. To release additional French troops the British extended their line west from Doiran to the Vardar; Sarrail was thus enabled to form an offensive group (of 2½ French divisions, one Serbian division and a Russian brigade) under Cordonnier, in addition to the Serbian striking force of four divisions.

*Sarrail's Tactical Errors.*—On Sept. 10 the British detachments crossed the Struma in raids at six points to divert the enemy's attention, and on Sept. 11 the real attack developed west of the Vardar. The Serbs, skilled mountain fighters and inspired by the closeness of their native soil, made good progress, and on Sept. 14 gained the pass of Gorničevo, breaking through the hostile front. But the Cordonnier group was slower, partly because of transport difficulties and Cordonnier's own inclination for the secure methodical advances he had practised successfully in France. As a result, however, the Bulgarians, broken by the Serbs at Gorničevo, were able to fall back across Cordonnier's front and re-establish their lines on the Brod. Sarrail, incensed, ordered fresh attacks by both groups; which were repulsed by heavy loss—as Cordonnier, protesting, had prophesied.

Between Sept. 30 and Oct. 8 the British XVI. Corps (Briggs) advanced its front to the line Agho Mahale-Ormanli, as a fixing move, coincidentally with a fresh attack on the main front by the French

and Serbs from Kaimakçalan westward. The pressure of the Serbs turned the Bulgars left and forced a further slight withdrawal, but a Franco-Russian attack on Oct. 6 failed. Cordonnier urged the idea of a wider turning manoeuvre, but Sarraill, in the mistaken belief that a Bulgarian collapse was imminent, ordered a fresh blow on Oct. 14. This was a costly failure and led to a violent scene between Sarraill and his subordinate. Cordonnier left for home a few days later. This internal friction caused a temporary breakdown of action, and the Serbs were left to fight unsupported, until Sarraill took the step of putting the whole attacking force under the Serbian Gen. Michich—a man of real military genius and with the knack of inspiring not only Serbian but other national forces.

Michich attacked in the Crna bend on Nov. 12 while, to aid this offensive, Milne's troops made local attacks and raids as a diversion on the Struma. Despite rain and snow the Serbs pressed on, turning successive positions, with the French, Russians and an Italian brigade on their left. Monastir was outflanked and on Nov. 19 was found evacuated—the first important Serbian town to be regained. For a moment there was a real opportunity of exploitation, as the Bulgarians were in full retreat towards Prilep; but the immediate attacking forces were tired and hungry, and Sarraill suspended the advance—to the annoyance of the Serbs, who, in default of receiving fresh reserves, tried to press on unsupported until exhaustion stopped them.

By this time the Rumanian collapse, under pressure of the convergent German and Bulgarian attacks, was clear, and on Dec. 11 Sarraill received instructions to consolidate a defensive line embracing as much of the regained territory as possible. This line stretched from Lake Prespa—just north of Monastir—north slopes of Kaimakçalan—to the Vardar, and thence by Doiran to the Struma and down to the sea. Its worst feature was that the commanding heights were held almost everywhere by the enemy. This front was to remain practically unchanged until Sept. 1918.

*Preparations for 1917.*—Apart from the incident of a threatening Greek concentration in Thessaly—settled by a fresh ultimatum—the winter months of 1916–7 passed quickly, and the opportunity was taken to reorganise and regroup the forces. From the Gulf of Orfani to the Vardar the front was held solidly by the British, owing to Milne's insistence, but on the rest of the front Sarraill followed his usual plan of interspersing detachments of the various nationalities—presumably on the principle "*divide et impera*." Whatever its personal advantages it was hardly conducive to prompt and effective action. Reinforcements had now brought the French up to a strength of eight divisions, while there were six Serbian and 1½ Italian divisions—making with the British 21½ divisions, plus two Russian brigades. The total Allied strength was approximately 600,000, while the Greek National Defence, or Veniselist Army, was in process of formation. This concentration afforded adequate reserves for a resolute offensive in the spring.

Confronting the Allies were still the nominal German XI. Army, and Bulgarian I. and II. Armies, comprising the equivalent of one German and 13 Bulgarian divisions,<sup>1</sup> of which practically half faced the British. Apart from the II. Army, these forces were under a German Commander-in-chief, Gen. Von Scholtz. On their side no large move was considered, partly because the Bulgarians had already achieved their principal territorial aims, and merely desired to hold tight, while the Germans were satisfied with immobilising so large an Allied force at no expenditure to themselves.

*Allied Attacks Renewed.*—Sarraill's plan was for a preliminary flanking move on the extreme west, between Lakes Okhrida and Prespa, to shake the enemy's hold in the Monastir area; following this was to be the main fixing attack by the British on the Doiran front; then the French, Russians and Italians in the southwest of the Crna bend were to advance; and finally the Serbs were to strike the decisive blow to the west again.

<sup>1</sup> A Bulgarian division had almost twice the infantry strength of a French or German division.

The preliminary move began on March 12 and was soon suspended, achieving little apart from a creditable French local success on a spur west of Monastir. Then came the British turn—to attack the key position formed by the Dub and lesser ridges which commanded the passage between Lake Doiran and the Vardar. Milne had rejected an alternative proposal of Sarraill's that he should attack to gain Sere, which while attractive as a political advertisement had no military value, and being dominated by the hills behind would have been difficult to hold. After a two days' artillery preparation, in vile weather, the British infantry advanced to the assault, on a two-division front (22nd and 26th), at 9:45 P.M. on April 24, the late hour being to gain surprise and protection. On the left the enemy's first position was gained and held, but in the centre and right the difficulties of the Jumeaux ravine and the strength of the resistance foiled the attackers.

Worst of all, their sacrifice was in vain and their "fixing" rôle rendered abortive because the attack west of the Vardar was postponed by Sarraill, ostensibly for climatic reasons. Not until May 9 did the other attacks develop. Sarraill had rejected the Italian proposal for a flanking manoeuvre, in preference for a frontal blow, and this, made by the French and Italians, was a costly failure. The Serbian attack was even less effectual, in fact hardly developed, partly owing to internal political troubles then rife and partly to their want of confidence in the higher direction and in the genuineness of its intention to support their efforts. Once more the British, on the night of May 8, had delivered a fixing attack, and once more their heavy sacrifice had been purposeless. The offensive was definitely closed down by Sarraill on May 24.

The Bulgarians, content with the prestige of this successful repulse, attempted no counter-stroke, and as the Allied forces were neither in the mood nor the condition for further efforts, the front relapsed into stagnation for the rest of the year. The only minor incidents were a successful local advance in Sept. by the French on the extreme left, west of Lake Okhrida, and Milne's withdrawal of his right from the marshy valley to the foot-hills west of the Struma, a precaution to lessen the danger of malaria and dysentery. The focus of interest again became political—common action was taken to settle the simmering menace and intrigues of Greece. In June, Allied troops invaded Thessaly, but the abdication of King Constantine was forced without fighting, and the Veniselist Govt. returned to power. The consequent reinforcement of the Allies by the Greek Army came as a prospective counterpoise to the contemplated withdrawal of two British divisions in Sept. for the projected offensive in Palestine.

*Sarraill Superseded.*—At the end of the year the new Clemenceau ministry recalled Sarraill, in response to the renewed requests of the British and Italian Govts., which were supported by Foch. His successor was Gen. Guillaumat, who had distinguished himself as an army commander on the Verdun front. His first aim was to restore confidence and cohesion in the Allied forces at Salonika, while hastening the reorganisation and training of the Greek Army. His second, to think out and prepare the plan for a fresh offensive, adopting in its main outlines one which Gen. Michich had suggested in 1916. But to obtain the sanction of the Allied Govts. was more difficult, obsessed as they were with the threatened German offensive in France, and in any case dubious of the effectiveness of any major operation in Macedonia. While biding his time, however, Guillaumat seized the opportunity to "blood" his new Greek troops in an ably planned *coup de main* against the Srka di Legen ridge. Supported by a powerful concentration of French artillery it was completely successful, and Guillaumat withdrew the attackers into reserve before any possible counter-stroke might dilute the moral tonic. On the main front there were no other incidents of note between Jan. and Sept. 1918; but away on the Adriatic coast, in Albania, Ferrero's Italian XVI. Corps, aided by a French division, advanced in July from the Viosa to the line of the Semeni and Devol rivers; an Austrian counter-offensive late in Aug. regained most of the lost ground.

In July also, Gen. Guillaumat, his task of reorganisation completed, was summoned back to France, to be entrusted with the defence of the capital in view of the critical situation caused by the German offensives. A man who put first not his own interests, nor even those of France, but his duty to the Allied forces as a whole, his military ability had won the respect, as his character had won the esteem, of the multifarious contingents. He was succeeded by Gen. Franchet d'Esperey, who if, perhaps not possessing the exceptional tact and supra-national outlook of Guillaumat, was yet an able strategist, and well able to maintain allied cooperation. He adopted and put the finishing touches to Guillaumat's offensive plan, while the latter utilised his position at the centre of policy to gain sanction for its execution. Winning over M. Clemenceau, he then went to London and Rome on the same mission, and at last on Sept. 11 Franchet d'Esperey was authorised to attack—if there was still little confidence in its success.

#### IV. THE DEFEAT OF BULGARIA

The military situation on the eve of the offensive was numerically little changed. The Bulgarians had a ration strength of some 700,000 and a rifle strength of 200,000—divided into the same three armies. The Allies had a ration strength of about 574,000 and a rifle strength of 157,000, although against the inferiority of numbers they could put a slight preponderance in artillery and a heavy one in aircraft. But the real defect on the enemy's side was the first underlying war-weariness of the Bulgarians and their dissatisfaction with their German directors; and secondly the divided command by which the so-called German XI. Army and the Bulgarian I. Army—from Doiran westwards—were under Von Scholtz, while the Bulgarian II. Army and the coastal detachments were under the Bulgarian commander-in-chief, Gen. Gekoff.

*Allied Offensive Plan.*—Franchet d'Esperey's plan was first to strike a concentrated blow with a Franco-Serb group under Michich on a narrow front of seven miles along the Sokol-Dobro Polje range, aiming at a tactical break-through and a subsequent expansion of the breach to gain and clear the triangle formed by the Crna and the Vardar. This would menace the enemy's communications on both flanks, and the offensive would then be taken up in turn by the other forces along the front. The initial objectives were relatively modest, for the possibility of a strategic break-through, ending in the overthrow of the enemy armies, was no more than an idea in the commander's mind.

The immense difficulties of the terrain and the scantiness of reserves made even this limited aim far from certain of success. But Franchet d'Esperey's plan, made possible by the wholehearted co-operation of the other Allied commanders, was an admirable fulfilment of the principle of concentration. On the vital sector six Serbian and two French divisions with 600 guns—more than a third of the total artillery strength in Macedonia—were concentrated against one Bulgarian division, and to do this the other sectors were almost stripped of their artillery.

*Opening of the Attack.*—On Sept. 1 the British 27th Div. made a feint attack in the Vardar valley to divert the enemy's attention, and on the night of Sept. 14 a heavy bombardment was begun on the real front of attack. Next morning at 5:30 A.M. the French divisions assaulted and after hard fighting gained the Dobro Polje ridge, the Sokol also falling by the evening—opening a path for the Serbian divisions of the I. Army, hitherto in reserve, to be pushed through. At the same time the Serbian II. Army advanced to the attack. By nightfall on Sept. 16 a penetration of five m. had been made.

*British and Serbian Successes.*—The Serbs, now inspired by success and the sight of their homeland, swept forward with such *élan* that by the night of Sept. 17 they were 20 m. forward, and the breach had been expanded to 25 m. by Greek and French divisions on the flank. After the initial clash resistance was feeble, partly because the mountains hampered the lateral movement of reserves. By Sept. 19 the left wing of the attackers had reached across the Crna, while the right wing was rolling up

the front eastwards towards the Vardar, and between the two wings the Serbian cavalry had penetrated to Kavadarci in the apex of the Crna-Vardar triangle. Meanwhile on Sept. 18 Milne's troops attacked on the whole front from the Vardar to Lake Doiran in order to prevent the Bulgarians withdrawing troops to dam the breach west of the Vardar. Facing the British were the pick of the Bulgarian troops and also the strongest fortified positions, so that although they penetrated the enemy's lines along most of the front, it was little wonder that lack of reserves and artillery compelled them to yield up the larger part of their gains. But they had fulfilled their mission of pinning down the enemy including the reserves during these critical days, Sept. 18 and 19, and by Sept. 21 the whole of the enemy's front west of the Vardar had collapsed under the convergent pressure of the exploiting Serbs and of the French on their flanks.

*Collapse of the Bulgarians.*—By the afternoon of the same day the collapse spread to the Doiran—Vardar front, and the British aircraft spread havoc among the troops of the Bulgarian VI. Army falling back through the narrow Kosturino pass. Similarly, on the extreme west, facing Prilep, the Italians joined in the advance. From now on the advance became a strategic pursuit, now fast, now slow, in which successive rearguard resistances of the enemy were outflanked. On Sept. 23 the Serbian spearhead reached Gradsko, and Veles three days later. Seizing their opportunity, a French cavalry brigade under Gen. Jouinnot-Gambetta made a dash for Skoplje (Üsküb), and seized this vital centre of communications, the key to the whole front, on Sept. 29. This definitely separated the XI. Army from the remainder of the Bulgarian forces, forcing them on divergent lines of retreat. To the southeast the British had already invaded Bulgaria itself, taking Strumica on Sept. 26. That night a Bulgarian staff officer arrived at British headquarters to ask for an armistice, and three days later the Bulgarians capitulated, accepting the Allied terms unreservedly. The first national prop of the Central Alliance had fallen. While the reoccupation of Serbia proceeded rapidly, a mixed striking force was rapidly organised under Milne's command to advance through Thrace on Constantinople, and had pressed as far as the Maritsa, seizing the bridgeheads, when Turkey—her force in Syria already annihilated by Allenby—surrendered on Oct. 30.

**ŠALOUN, LADISLAV** (1870– ), Czech sculptor, was born at Prague, and was a pupil of the sculptor B. Schnirch. He first became known in 1901 when he won the competition for a monument of Jan Hus. This group of statuary which dominates the Old Town Square of Prague forms an example of that plastic impressionism which Šaloun represented. He also produced a number of portraits which are distinguished by an acute sense of reality.

**SALT LAKE CITY**, Utah, U.S.A. (see 24.92), the manufacturing and trading centre of the western inter-mountain territory, increased in population to 118,110 in 1920, of whom 19,897 were foreign born; and to 130,948 in 1925 (census bureau estimate). Products manufactured within the city had a value of \$13,351,000 in 1909, \$33,357,000 in 1919, \$31,130,287 in 1921, \$47,572,228 in 1923 and \$106,000,000 in 1924. Many important plants were established after the World War, increasing the aggregate factory pay-roll by about \$4,000,000 per annum. Electric light and power were supplied by an interconnected hydroelectric system with an installed capacity of 250,000 H.P., supplemented by a steam emergency plant of 50,000 horse-power. An additional generating station, to add 45,000 H.P., was under construction in 1925.

The retail trade for 1924 was estimated at \$52,312,000; the wholesale and distributing business at \$148,116,000. A branch of the Federal Reserve Bank of San Francisco was established here in 1918. The parks and playgrounds of the city itself by 1925

contained 1,035 ac., and expert supervision was provided for organised play. There were 58 public schools, including two high and seven junior high schools, with an enrolment of 30,218 pupils. The University of Utah had a registration of 2,692, exclusive of the summer school. A state capitol, built of marble and Utah granite, well placed on an eminence, was completed in 1916. In 1911 the city adopted the commission form of government.

**SALVADOR** (see 24.96), the smallest of the Central American republics. Salvador became a member of the League of Nations in 1920. During the World War the republic maintained an attitude of benevolent neutrality towards the United States and the Allies; but in a note of Aug. 24 1917 the Foreign Minister stated that the Govt. of Salvador would permit the vessels of the United States to enter or remain in Salvadorean ports irrespective of their condition of armaments. Area, officially estimated, 13,176 square miles. The population in 1923 was 1,506,176, indicating a population denser than that of any American republic except Haiti. The estimated population of the chief cities in 1924 was: San Salvador, 82,000; Santa Ana, 71,000; San Miguel, 35,000; San Vicente, 31,000; La Paz, 30,000. In 1923 the births numbered 56,184; deaths, 25,296; nearly 60% of the births were illegitimate. Half-castes or Lavinos and Indians constitute the bulk of the population; but most of the educated classes are of European descent and reflect European influences.

**Political History.**—The presidential succession after 1909, when Gen. Fernando Figueroa held the presidency was mainly peaceful. Figueroa was succeeded in 1911 by Dr. Manuel Enrique Araujo, who was murdered in Feb. 1913. The vacant presidency was filled by the vice-president, Carlos Meléndez, who resigned in Aug. 1914. Alfonso Quinones Molina governed as temporary president until 1915, when Carlos Meléndez was elected to office. In March 1919 Jorge Meléndez was inaugurated for the term 1919-23; and was succeeded for the term 1923-7 by Alfonso Quinones Molina, the vice-president.

Salvador alone of the Central American Republics declined to declare war on Germany, though she allowed U.S. war vessels the use of her ports. The inclusion, without definition, of the Monroe Doctrine in the Covenant of the League of Nations, led Salvador to interrogate the United States Govt. as to the interpretation of the doctrine. In 1920 Salvador attempted to renew the Central American Court of Justice established by the treaty of 1907. This movement gave place to that of the Central American Union (*q.v.*). Salvador signed the "Tacoma" agreement of Aug. 20 1922, but did not approve all the resolutions of the Washington Conference on Central American affairs of 1922-3. In the General Treaty of Peace and Amity she failed to approve the International Central American Tribunal and the international commissions of inquiry. She also rejected the agreement not to recognise the election to the presidency of leaders of revolts or high government officials involved in them, and she declined to set a constitutional limit to re-election. She also rejected the convention relative to the preparation of electoral legislation and convention for establishment of free trade. Approval was given to limitation of armaments, the establishment of permanent Central American Commissions, the extradition agreement, the convention establishing agricultural experimental stations and that regulating the practice of the liberal professions. Several of the conventions still awaited approval in Aug. 1925.

A loan of \$6,000,000 was effected in Oct. 1923, through a New York banking firm. It was secured by a first lien on 70% of the total customs. The contract provided for underwriting the loan by the United States; differences concerning interpretation of the terms were to be submitted for ruling to the Chief Justice of the U.S. Supreme Court. The proceeds were used in consolidating and paying the outstanding loans.

Education has long been nominally free and compulsory, but until 1919 received little attention from the Government. In 1911 there were 486 schools with 21,569 pupils, out of a total of 173,495 children of school age. In 1919, a law for eradicating illiteracy was enacted, and a campaign begun to reduce the proportion of illiterates, then 70% of the population. In 1924 there were 733 primary public

schools with 1,110 teachers, the registered pupils numbering 44,791 with an average attendance of 30,070. There were 37 private primary schools and 38 municipal schools, in addition to normal, technical and continuation schools. The National University at San Salvador has faculties of medicine, chemistry and pharmacy, law and social sciences, engineering and industry. In addition the Popular University for working men offers lectures on personal and shop hygiene and the duties and rights of citizens.

**Finance.**—In 1919 the colon was fixed at the value of \$0.50 American, and by the law of July 16 1920 was made the monetary unit, and given a fineness of 900 millesimos and a content of 836 milligrammes. It is issued in denominations of 5, 10, 20 and 40 colones, with auxiliary silver and nickel coins. United States gold and silver coin is legal tender up to 10% of payments. The national revenue and expenditure for the three years 1920-1, 1924-5 and 1925-6 was:—

|             | 1925-6                  | 1924-5                  | 1920-1     |
|-------------|-------------------------|-------------------------|------------|
| Revenue     | 18,205,860 <sup>1</sup> | 16,464,034 <sup>1</sup> | £2,945,234 |
| Expenditure | 18,166,715 <sup>1</sup> | 16,414,034 <sup>1</sup> | £3,245,516 |

<sup>1</sup> Estimated in colones.

The total debt Dec. 31 1922 was 34,259,059 colones. The foreign debt on Dec. 31 1925 was as follows: Bonds in the hands of English creditors to the amount of £1,008,314; other foreign debts £13,683,900. Customs receipts from Jan. 1 1923 were \$3,776,819. Interest and sinking fund on the loan above-mentioned required \$682,000. For the first six months of 1924 customs receipts were \$3,180,008, and loan requirements \$411,599.

**Agriculture and Commerce.**—Agricultural production for 1923 was valued at \$36,699,000. Coffee, the principal crop, totalling 60,000 metric tons, was valued at \$16,800,000; corn, totalling 250,000 metric tons, was worth \$12,500,000; cattle were valued at \$2,500,000. Cotton production has been encouraged for several years; the crop in 1923 was 55 metric tons, worth \$33,000. Sugar production reached 20,000 tons, valued at \$2,000,000. Other agricultural exports are tobacco, henequin and rice. Lumber, balsam and hides are also exported.

Foreign trade was chiefly with Great Britain, the United States and France. The movement of trade in the period 1912-24 was:—

| Year | Imports     | Exports     |
|------|-------------|-------------|
| 1912 | \$6,744,859 | \$9,942,184 |
| 1916 | 5,668,000   | 9,970,000   |
| 1921 | 8,486,453   | 8,479,548   |
| 1924 | 10,958,500  | 24,367,674  |

**Communications.**—With the opening of the third section in 1922 of the line from San Vicente to Cojutepeque, the International Railways line from east to west was completed. There were 253 m. of narrow gauge railways and 1,476 m. of national roads in the republic in 1925, also 2,401 m. of telegraph lines and a little greater extension of telephone lines. There were 20 wireless receiving stations. Material for 200 m. of railway to Guatemala had been ordered before June 1925. The lines from Santa Lucia, Santa Ana province, to Ahuachapán and from Santa Lucia to Metapán were soon to be completed.

(H. I. P.)

**SALVAGING** (see 24.97).—Salvage work, or the raising and recovery of sunken ships and cargoes, has always had a fascination, first for the reason that very little is known of the subject by the outside public, and secondly the spirit of adventure appeals to us to-day, although possibly in a modified degree compared with that which sent our forefathers out to search for hidden treasures in far-off lands. It is still one of the professions which retains a spice of romance in this commonplace world.

Salvage engineering has always been confined to a small number of the engineering profession, although it is a highly technical business, where skill, experience and determination are pitted against wind and sea. It necessitates trained men and special appliances and is a work that must be carried on night and day whenever the elements permit.

**Divisions of the Subject.**—Marine salvage may be divided up under a few principal headings:—

- (1) The raising of vessels sunk in deep water by means of pontoons, etc.
- (2) Raising by the application of compressed air to expel the water.
- (3) Refloating of ships stranded on rocks or sand where the bottom is damaged and temporary repairs have to be made by divers, and where pumping plant of different descriptions is used to free the vessel of water.
- (4) Uprighting of capsized vessels, etc.

**The Salvage Ship.**—The salvage ship is one of the most important factors in salvage operations, and, although generally a small vessel, carries a very complicated equipment of appliances for use in the work with a view to rendering her as independent as possible of assistance from ashore, and enable her to make repairs, etc., in out-of-the-way places where it would be difficult to obtain other assistance.

As an example, one of the most modern type is composite built and her dimensions are 170 ft. long by 30 ft. wide, fitted with triple expansion engines, and has a speed of 14 knots. She accommodates about 80 officers and men, consisting of engineers, artisans, divers, motor engineers, electrical engineers and others.

Her equipment consists of portable pumping plant of 5,000 tons per hour which can be transferred to the wrecked vessel, portable oil driven air compressors, portable electric lighting plant and electric submersible pumps which work under water.

The vessel has powerful electric arc lamps at the mastheads of 5,000 c.p., with sufficient length of water-tight cables to allow of them being placed on the wrecked ship and operated by the salvage ship's dynamos; also searchlights, submarine arc and incandescent lamps for the divers, submarine oxyacetylene burning plant for cutting plates under water, also a complete equipment of submarine pneumatic drilling machines up to 3 in. in diameter, pneumatic hammers, rock-boring drills and submarine photographic apparatus. She is fitted with long-range wireless telegraphy, and has a fully equipped workshop with electrically driven lathes, drilling machines, etc. In the store-room are all descriptions of blocks, shackles, ropes and other appliances necessary for discharging cargoes and other work in connection with the salvage of a wrecked vessel; she is also fitted as a first class and powerful tug boat, and carries line-throwing guns. Being constructed of wood she is able to remain alongside a damaged ship in weather when the vessel of ordinary construction would have to leave.

**Salvage Pumps.**—At one time steam pumps were entirely used in salvage operations, and were supplied with portable boilers so that they might be placed on board a wreck. They performed very excellent service, generally under most difficult conditions. To place such heavy gear on board a wrecked ship from a salvage craft rolling alongside on a winter night required a large amount of skill and care. When placed in position they had to be connected up to the portable boilers and steam raised before they were available for pumping. It was also necessary to place a supply of coal on board if the ship's bunkers were not available, and this supply was often washed away. Steam pumps are still retained on board the salvage ship, as they are able to perform work that the present type of pumping plant cannot do; for instance, sand, coal, grain and even copper and iron ore can be discharged by them from under water.

The internal combustion engine (*q.v.*) went a great way to revolutionise salvage pumping plant. It was much lighter than the steam pump, required no boiler, and the fuel could be carried to the wreck in barrels or drums in an ordinary ship's lifeboat. Further, when not required for work it can be stopped and started again in a few minutes, while steam has always to be kept on the portable boilers of the steam pumps. The advantages of the oil motor driven centrifugal pump will be obvious; it is just as efficient for pumping water as the steam pump, saves in cost of running, takes up less stowage space and uses paraffin as fuel, which can generally be obtained without difficulty. The sizes in general use are 12 in. and 6 in.

The latest type of pumping machinery is the electrically driven submersible. It has been well tried under all conditions and found more efficient than any of the older types. It can be placed aboard in boats and driven from the dynamos of the salvage ship lying off the wreck. There is no necessity to secure it, as it works practically without vibration and can be used from the derricks and lowered down into the water. Its great advantage is that while the ordinary salvage pump has only a lifting

capacity of 30 ft. the submersible is able to raise the water to a height of 80 ft.; no priming is necessary, and no particular attention need be paid to the discharge hose as far as making it air and watertight. Former electric salvage pumps that were tried were fitted with watertight cases, and proved entirely unsuccessful for this particular kind of work. In the submersible pump water is allowed free access to the electrical parts.

#### LIFTING OPERATIONS FROM DEEP WATER

With this somewhat brief description of salvage plant used particulars of actual salvage operations will be explained, commencing with the raising of sunken vessels from deep water by means of lifting barges dependent on the rise and fall of tide.

FIG. 1.—Lifting wires in position and buoyed.

The method of procedure is to place lifting vessels of sufficient buoyancy over the wreck and pass a number of 9 in. steel wire ropes under the vessel, bringing the ends of the wires up and making them fast to the lifting ships at low water; then as the tide rises, if the calculations have been correct, the vessel is raised from the bottom the height of the rise of tide, and carried into shallower water where the wreck is grounded, and the operations are continued each tide until her decks are above water (see figs. 1, 2 and 3). The fractures are then patched by the divers, salvage pumps installed and the vessel pumped out and floated. The dimensions of lifting vessels

Fig. 2. Lifting lighters in position. Wires secured, and pinned at low tide. Fig. 3.—Wreck lifted.

FIG. 2.—Lifting lighters in position. Wires secured, and pinned at low tide. FIG. 3.—Wreck lifted.

that have been employed in a large number of cases are: length 165 ft.; breadth 36 ft., and each with a lifting capacity of 1,500 tons maximum.

One of the principal difficulties with this method is the placing of the heavy wire cables under the bottom of the wreck, especially if she has sunk in the sand, mud or clay. If not too deeply embedded this is generally accomplished by towing them under with two vessels, one on each side, and the ends of the cables attached to them. Where this is not found to be possible owing to the wreck having become too deeply embedded a system of hydraulic boring at high pressure is resorted to, by which method the wires are rove under the wreck in the required positions for lifting.

In cases where there is little or no rise of tide submersible pontoons are used. These are really steel cylinders with a lifting capacity ranging from 50 tons each to 250 tons or more. They are divided into three watertight compartments and fitted with

low pressure air connections for expelling the water, and with high pressure air for opening the valves. The ends of the cylinders used at the lifting of H.M.S. "Gladiator" were dome-shaped, and covered with collision mats to protect them against chafing. Strong channel bars were riveted around the pontoons at intervals to carry the wire cables, and the whole of the cylinders between the channel bars were covered with 3-in. fir planking for protection against obstructions when lifting. Double 6 in. strops of special extra flexible wire ropes were fitted in the required position around the pontoons, and to these were attached plate shackles to which the 9-in. lifting wires were fastened. In this case the pontoons were used to uprighten the vessel, which lay over on her beam ends at an angle of 113 degrees.

The 9-in. wire cables were swept under the wreck and the outside ends attached to the pontoons. These were filled with water and sunk alongside the ship; the other ends of the wires were then hove in as tightly as possible and made fast to massive steel bollards fastened to the upper side of the ship. The cylinders or pontoons were then emptied of water by means of compressed air and the vessel uprighted, assistance being also given by compressed air and pumping from some of the sound compartments. In this case pontoons were only used on one side, but in order to raise a vessel that is sunk and lying upright on the bottom two sets of cylinders are necessary, and the plan of lifting is as follows:—

A sufficient number of 9-in. wire cables are placed under the ship, the pontoons are attached to the ends of the wires on one side of the ship and filled with water, and by heaving in on the opposite cables they are hauled down into the required positions alongside the wreck. A special form of hydraulic gripping machines is attached to the pontoons on the other side of the wreck and the wire cables rove through these hydraulic grips. When everything is ready the pontoons are filled and allowed to slide down the wire cables to the bottom. The grips are then closed from the surface vessel and compressed air pumped down to all the pontoons, which expels the water, and if sufficient buoyancy has been given by the pontoons the vessel is brought to the surface.

*Lifting by Compressed Air.*—All openings are closed by the divers, and compressed air pumped down to connections made to all the different compartments from air compressors of the salvage ships. The water is then expelled through the fractures and the vessel rises to the surface. This method entails a very large amount of diving work, as funnels, etc., have to be cut away and the openings closed and made airtight. Decks under air pressure have to be strongly shored up and supported.

*Refloating Stranded Ships.*—The conditions of rocking are very varied. Assuming a large vessel stranded on a rocky bottom on an exposed coast and sustaining such damage that all compartments are filled with water and the vessel appears at first sight to be a hopeless wreck. A diver's survey of the position is made as soon as possible, and at the same time a careful survey is made of all compartments to ascertain whether the water falls in each at the same rate as the tide. Some compartments will generally be found to be holding water, that is to say the tide does not ebb and flow in them as it does outside. The amount of pumping plant required can thus be easily gauged for compartments under these conditions. When the tide ebbs and flows as it does outside it shows considerable damage to the outer bottom, which necessitates extra pumping plant and the patching of the fractures by divers. Should the vessel have cargo on board a portion of it will probably have to be discharged to lighten the ship. After all this work has been done the vessel is pumped out and refloated.

The patches used by divers to close up fractures are generally made of wood and secured into position by bolts drilled through the patches and through the plating of the ship. Jagged or outstanding plating is cut away by explosives or by submarine oxyacetylene cutting plant to make a fair surface for the patches. If any rocks are in the way or have entered the hull of the wreck they are removed by drilling holes with submarine pneumatic rock drills and dispersing them by explosives. (F. Y.)

**SALVATION ARMY** (see 24.1000).—The Salvation Army is a religious organisation of international scope, founded in 1865 under the title of the "Christian Mission" in the east of London. Its founder, William Booth, formerly a Methodist minister, died in 1912.

The announcement of the founder's death was accompanied by the intimation that his eldest son, William Bramwell Booth (*q.v.*), formerly his chief of staff, had become the new general. Under a deed-poll of the Salvation Army, dated 1878, each general appoints his successor under seal, but the name of the person so chosen is not divulged until the proper time. At an International Staff Council in 1904 a supplementary deed-poll was adopted, the principal object of which was to set up machinery for removing from the position any general who proved to be unworthy of confidence, and also for the selection of a general by a high council of the Army called into being for this purpose, in the event of the position becoming vacant through failure to appoint or other cause.

*Extension.*—In many quarters it was feared that after the withdrawal of the forceful and picturesque personality who had dominated Salvation Army affairs for a generation, and had raised up a worldwide following from what was originally a despised and derided local effort in the slums of London, the Army would decline. The World War also was a menace to all international organisations. These fears, however, proved to be groundless. The number of adherents has steadily increased, and the "field" occupied has grown greatly in extent. At the time of the founder's death the Army was operating in 59 countries. At the end of 1925 its flag was planted in 81 countries and colonies.

Extension has taken place on every continent. In Europe new spheres of activity have been found in Czechoslovakia, Latvia and Hungary. In Asia, where the Army had its oldest mission field (India 1882), it has opened in China and Burma. Africa has become an important sphere for its missionary operations, and, in addition to what is known as South Africa, regular work is carried on in Nigeria, the Gold Coast, in Kenya and the Portuguese territories in the East. In the Western Hemisphere the accessions to the Army's field include Cuba, Honduras, Chile, Bolivia and Brazil. In the earliest countries to be occupied outside Great Britain important consolidation has taken place. Canada has been divided into two "territories" (a "territory" being usually a country or large part of a country under one command), one east and the other west, with Toronto and Winnipeg as the respective headquarters; Australia has been organised also into two "territories," with headquarters at Melbourne and Sydney; and the United States into three, with headquarters at New York, Chicago and San Francisco. In Great Britain sub-territories have been set up in Scotland and Wales.

*The Corps.*—The Army has more than 14,000 corps or societies, each of which serves not only for the establishment of its own members in the faith, but as a centre of aggressive evangelistic effort. It has also 1,400 social institutions for the friendless, unfortunate and wayward. In the British Is. the centres number 1,500, and reach a similar figure in the United States; in Canada there are between 600 and 700, and in Australia and New Zealand nearly 1,900. India, with Ceylon, has nearly 5,000 such centres, and the Far East 450. The number of officers and cadets engaged in field and social work is about 22,360. The Army's mission field has greatly extended, and many of its officers who work devotedly in their own dark lands were, but a few years previously, themselves in the bondage of superstition. The right method of evangelising the people is found in the employment of converted officers of their own race and speech. In Japan, for instance, 98% of the officers are Japanese.

*New Organisations.*—The progress which continued under the second general is not to be measured merely by an extended front. New organisations have been called into existence, especially for influencing and instructing the young of both sexes. Careful provision has been made to insure a constant replenishment of officers by means of institutes for the training of cadets. In each year upwards of 1,800 young men and women are trained for Army work, to which they have to devote the whole of their time. Congresses on national and international lines are held frequently for the instruction and encouragement of officers. Constantly increasing use is made of the printing-press. The

various *War Crys*, as the principal periodical publication of the Army is called, are issued in between 30 and 40 languages.

*Finance*.—Greatly increased sums of money have been raised as the movement progressed. The financial system of the Army is of a very carefully organised character. Roughly it may be said to be divided into two parts, local and central, the one concerned with the local unit or corps, financing itself by its own efforts; and the other concerned with the provision of funds (1) for properties, the training of officers, missionary enterprise, and (2) for social work in Great Britain. In the year ending in Sept. 1925, the total income received at International Head Quarters for (1) was £599,768, and for (2) £71,174.

*Social Work*.—The social work, which received its first great impetus in 1890 with the publication of *In Darkest England and the Way Out*, by William Booth, has become not only more extensive but more varied in character. This work from the first has been regarded by the Army leaders as an organised warfare against social evils in order to clear the way for evangelisation. It was realised that the physical and environmental condition of many of the people, especially in great cities, made it extremely difficult for them to apprehend the spiritual message which the Army had to deliver. Therefore various social activities arose, diverse in character but all actuated by the same purpose, from the provision of free breakfasts and night shelters to the settlement of people in overseas dominions. This last is a department of work characterised by careful selection of the emigrants, and is coupled, particularly in the case of the young, with training beforehand and effective provision for future care, while work is assured upon arrival. The efforts of the Army in getting men to work on the land, both in England and overseas, have called forth many commendations from statesmen and others.

Rescue work among women was one of the earliest social tasks to which the Army set its hand. In this work Mrs. Florence Booth, wife of Gen. Bramwell Booth, was the responsible leader from its inception until 1912. Maternity work has been carried out by the Army's ministering women, and for this in 1918 the Army received a grant from the British Govt.—the first state subsidy ever made to the Army in the country of its origin. In other lands also social work has proceeded, adapted to the different national conditions and needs, and often commended and assisted by the governments concerned. This is true also of eastern lands: thus settlements for criminals have been established in India, and leper colonies in the Dutch Indies; and these are but instances of many such works.

*Spiritual Character of the Work*.—With this development of organisation the Army has maintained its original character as a body of spiritual witness and aggressive evangelism. In theory and creed it is at one in almost every respect with orthodox evangelical belief, but its methods—its realistic presentation of religion, and its use of various constraining means to bring people to salvation—distinguish it from other religious bodies. It continues to lay the greatest emphasis upon the need for conversion, preceded by penitence, and followed by growth in holiness. The people gathered into its ranks are cared for by its officers and trained in a real separation from the world and devotion to Christ. They are set to work immediately with a definite objective, their zeal is employed in the winning of others, and public testimony is required from them, however unlearned or backward in religious experience they may be.

A large place in the Army's endeavours is given to music and song. In every country the band—usually a brass band—is a feature of Army work. The strains of such a band, reaching farther than the human voice, draw numbers within earshot of the Army's message who would otherwise not be attracted. The Army has also made use of improvisations of various kinds, not only because in this way public attention is more likely to be caught, but because these methods prevent the officers from falling into the conventional and the ordinary. Those who conduct Army meetings are instructed to talk in a colloquial fashion, and, speaking generally, formal sermons are discouraged.

*Ideals of Conduct*.—The Army exacts a high standard of behaviour for its adherents. In the series of *Orders and Regulations* for officers and for the rank and file definite guidance is

given even in the smaller matters of everyday conduct. Officers accept a relative poverty, being content to receive sufficient for their simple needs. There are contributory funds from which they receive allowances on retirement, and from which provision is made for widows and orphans. Marriages are solemnised "under the flag," and children of members are dedicated to become soldiers or officers in the "war." Officers wear a regulation uniform, which it is not permissible for the individual to vary. The uniform is regarded as a means of confessing to the world the fact of separation and consecration, as opening the way to many opportunities of usefulness which would not otherwise appear, and as making possible instant recognition and fellowship amongst Salvationists themselves. One of the great principles of the Army, firmly adhered to, is that women have absolute parity of privilege, position and dignity.

An order of the founder has been instituted to mark distinguished and memorable services, revealing the spirit and purpose of the Salvation Army, such as would have especially commended themselves to William Booth. Some 30 officers have been admitted to this order. A memorial to the founder was projected in the shape of an International Training Institution in London, at a total estimated cost of £350,000, towards which about £250,000 sterling had been raised up to Dec. 1925.

Carpenter, *Notable Officers of the Salvation Army* (1925); H. L. Taylor, *General Booth's Journal* (1925); B. Booth, *Echoes and Memories* (1926). (W. B. B.\*)

**SALVEMINI GAETANO** (1873- ), Italian historian, was born in Molfetta in Sept. 1873. In 1902 he became professor of mediaeval and modern history at Messina University. He then went to Pisa University, and in 1917 was appointed to the chair of history at Florence University. His best known works as a historian are *Magnati e Popolani in Firenze dal 1280 al 1295* (1899); *La Rivoluzione francese 1789-92* (1905); *Mazzini* (1915) and *L'Italia e gl'Imperi Centrale dal 1871 al 1915*. He became known to the British public through his lectures delivered in London University in 1923 and 1926. In politics he showed views of a liberal trend which brought him into conflict with the Fascist Government. He edited the liberal newspaper *L'Unità* (1911-21). Before the World War he vigorously criticised the Socialists for their half-hearted social work, and attacked Giolitti's electoral methods. During the War he was a leading advocate of Italian diplomatic moderation. He was a member of the Italian Parliament from 1919-21. After the Fascists captured power, however, his political activity was made impossible, and, being suspect, he was in constant personal danger. In June 1925, while in Rome, he was arrested and taken to Florence, where he was charged on the hearsay evidence of a printer with complicity in the production of an anti-Fascist newspaper *Non-Mollare*. He was imprisoned for 35 days before being tried. No evidence but that of the printer was cited, and his case was postponed till July 1925 when he was provisionally released. Professor Salvemini was compelled to leave Florence and was kept under police surveillance until Oct. 1925, when he took the occasion of the government amnesty, proclaimed for the Matteotti murderers, to leave the country. He resigned his post at Florence University on Nov. 5 1925 and was "dismissed" from it on Dec. 1. Afterwards he resided in London.

**SALVINI, TOMMASO** (1829-1915), Italian actor (see 24.103), died at Florence Dec. 31 1915.

**SAMOA** (see 24.115), a group of islands in the South Pacific, which were before the World War divided between Germany and the United States under an agreement made between these Powers and Great Britain in 1900.

*West Samoa*.—The former German islands of West Samoa were occupied by a New Zealand expeditionary force on Aug. 30 1914, and on May 7 1919 a mandate for these islands was conferred by the Supreme Council in Paris on New Zealand. The Govt. of New Zealand asked the British Govt. for legal authority to act under the mandate, having no special desire to exercise independent action in the matter. The German holdings

of land, amounting to over 8,000 ac., were taken over by the New Zealand Government. The constitution was settled by the Samoa Act of 1921, and an Amending Act of 1923. It is administered by an Administrator appointed by the Govt. of New Zealand; he has the assistance of a legislative council, and a consultative native council. The principal islands are Savai, with an area of 725,000 ac. and Upolu, and the total population of the islands was estimated in 1925 at 38,829. Coconut, cacao and bananas are the principal products and copra is the principal article of export. The total exports in 1924 were valued at £361,418, and imports at £274,803. The revenue in 1925 was £130,914 and the expenditure £135,523. The revenue is augmented by an annual subsidy from New Zealand based on the additional costs of the education and medical services since the acceptance of the mandate by New Zealand, and on the cost of the wireless station in excess of revenue. (See MANDATES.)

*Eastern (American) Samoa* is administered by a commandant who also holds the governorship by commission from the President of the United States. Almost the whole of the land is owned by the natives, the principal article produced for export being copra. The total area is about 58 sq. m. and the population 6,125, the largest islands being Tutuila and Tau. The harbour of Pago Pago is a United States naval station. Tutuila has a high power naval radio station, which is also used for ordinary commercial traffic.

See the annual *Reports of the commandant at Tutuila, Pago Pago, Samoa* (Washington, D.C.), and the *New Zealand Official Year Book* (annual, Wellington, N.Z.).

**SAMUEL, SIR HERBERT LOUIS** (1870– ), British politician, was born at Liverpool Nov. 6 1870. He was educated at University College School, London, and at Balliol College, Oxford, where he graduated in 1893. In 1895 and 1900 he unsuccessfully contested South Oxfordshire as a Liberal, and in 1902 was elected for the Cleveland division of Yorkshire. He entered Sir Henry Campbell-Bannerman's Government in 1905 as parliamentary under-Secretary to the Home Office. In 1908 he was sworn in the privy council. From 1909 to 1910 he was chancellor of the Duchy of Lancaster, with a seat in the Cabinet, and in 1910 became postmaster-general. He held this office until 1914, and then became for a year President of the Local Government Board. From 1915 to 1916 he was again postmaster-general and chancellor of the Duchy of Lancaster, and in 1916 became Home Secretary. He acted as chairman of the select committee on national expenditure (1917–8), and in 1919 was special commissioner to Belgium. In 1920 he was appointed high commissioner to Palestine and was created G.B.E. This post he retained until Aug. 1925, when he returned to England and was made chairman of the royal commission appointed to inquire into conditions in the coal industry, as a result of the dispute between the coal-owners and the miners in the summer of that year. The report issued by the commission is often referred to as the Samuel Report. (See COAL.)

**SAN, BATTLES OF THE:** See DUNAIEC-SAN, BATTLES OF THE; VISTULA-SAN, BATTLES OF THE.

**SAN ANTONIO, Tex., U.S.A.** (see 24.126), continued its rapid growth after 1910. In the following decade the population increased 67%, reaching 161,379 in 1920, of whom 14,341 were negroes and 36,824 foreign born (including 28,477 Mexicans). The census bureau estimate for 1925 was 198,069.

San Antonio is the centre of a rich oil-producing area which developed rapidly after the opening of the first field at Somerset in 1919. Two direct railway lines connect it with the new deep-water port at Corpus Christi. Five irrigation projects (under construction in 1925) will bring under cultivation about 500,000 ac. of new land. The large and varied establishment of the U.S. Army (with about 12,000 troops) included three flying grounds, a great motor-transport camp, an artillery camp, and an artillery and rifle range, in addition to the arsenal and Fort Sam Houston, which is a cavalry post and headquarters of the VIII. Corps area. The output of the factories was valued at \$13,435,000 in 1909, \$35,456,000 in 1919 and \$34,756,016 in 1923, when there were 297 establishments, employing 5,581 wage-earners.

The leading industries were iron and steel, candy, textiles, cigars, leather goods, clothing and soap. Gas and electric current for industrial and domestic consumption were supplied by the San Antonio Public Service Co., which was constructing a high-power hydroelectric station on the Guadalupe river in 1925.

The commission form of government was adopted in 1914. Among the public improvements under way in 1925 were flood-prevention works and a municipal auditorium. The water supply (derived from 17 artesian wells and sufficient for a city of over 500,000) was purchased by the city for \$7,000,000 from a private corporation. In respect of school attendance, San Antonio in 1920 ranked last but one among the cities of 100,000 population and over; and in "illiteracy" third.

**SANCTIONS AND GUARANTEES** (see 14.695) in international law correspond to the means adopted in national law to enforce legal decisions, but the decisions to be enforced are international decisions. During the years which followed the World War it became increasingly apparent that the most important and the most enduring of European political problems was that known as the problem of security (*q.v.*).

*Terminology.*—As a deduction from the new conception of security the word "sanctions" began to replace in the language of diplomacy the word "alliance." Security was now to be sought not in limited agreements between small groups of states to fight together whenever any of them should, for whatever cause, be involved in international conflict, but in common agreements among a greater or smaller number of states to act together when—and only when—the established rights of one of them had been violated by force. Security, therefore, must be found in "sanctions" against the wrongdoer. For some time indeed, the word "guarantees" was used instead of, or on an equal footing with, the word "sanctions." The first security scheme prepared by a commission of the League of Nations was, for example, originally called a "treaty of mutual guarantee," but gradually the use of the word "guarantee" disappeared and the word "sanctions" took its place.

This change in phraseology was right, for the security arrangements which European politicians after the War endeavoured to set up constituted nothing more nor less than an attempt to create a rudimentary international police. They constituted an attempt in international affairs to limit and control the use of force as it is limited and controlled in national affairs; an attempt, that is to say, to put force within the law instead of leaving it without the law to cause the international disorders which have resulted from its use in the past, and to this end to create a system of sanctions closely analogous in principle, though not of course in form, to the sanctions which support the legal system of every civilised state.

The discussions which occurred during the years immediately after the War soon showed that there were two ways of achieving the result in view; the first was by the creation of a general system embracing all the States throughout the world; the second was by the creation of limited arrangements applying to a certain number of States situated in geographical proximity to each other and bound together by common bonds of material interest. The first corresponded broadly to the application in international affairs of the principle of the sheriff's posse; the second was an elaboration, with of course essential changes, of the method of the pre-War military alliance.

*Article 16 of the Covenant.*—It was by the application of the general method that the first step was made towards the organisation of a true system of international sanctions. This first step consisted in the adoption of the Covenant of the League of Nations, Article 16 of which imposes obligations upon every member of the League to adopt common coercive measures, including especially a financial and economic boycott against states which, in violation of the undertakings of the Covenant, resort to war. It was believed by the authors of the Covenant that the system of Article 16 would, if loyally applied by the members of the League, act as a very powerful deterrent against aggression. But Article 16 unfortunately contained ambiguities the effect of which was to create in the minds of many govern-

ments doubt as to the kind and the amount of help which the members of the League would in practice give to any state that might be wrongfully attacked. It was not, therefore, generally regarded as by itself creating a sufficiently sound system of sanctions to solve the problem of security. For that reason the temporary mixed commission set up by the Council of the League of Nations prepared in 1923 the draft treaty of mutual guarantee (or assistance), on the basis of which was prepared the Geneva Protocol of 1924. Both instruments were founded on the clear acceptance by all signatory states of obligations to co-operate by military or other necessary means against an aggressor, and if they had been ratified they would have been regarded by the governments which drew them up as a substantial progress towards providing the common action required for the protection of loyal members of international society against disloyal attack.

**Regional Guarantees.**—The second method, which in the early stages of the security discussions had great prominence, received its first application in the Anglo-American-French guarantee treaties drawn up in 1919 at Paris. These treaties failed to secure ratification, and were replaced by the Franco-Belgian, Franco-Polish and other similar treaties of alliance. The Little Entente was another example of the same method. But it was recognised even by the authors of these treaties that although they were subject to the Covenant of the League they were nevertheless, liable to degenerate into alliances of the old sort, and that therefore they would be dangerous unless they were effectively controlled by the League. It was the temporary mixed commission above mentioned which first established the principles of the League control which would make such partial treaties consistent with a general system of sanctions. The Commission recognised that in cases where for whatever reason there was great danger of war, special reinforcement for general obligations might be required, and in the draft treaty of mutual assistance the two methods were for the first time combined into one coherent system. The Protocol similarly recognised the utility of special treaties in support of general sanctions, but on condition that such special treaties could only be applied after it had been recognised by some impartial arbitrator that aggression had taken place.

After the first failure of the combination method of the Geneva Protocol, a return was made in the Locarno Agreements and the Rhineland Pact to the method of partial treaties. These agreements, however, in no way resembled an old-time alliance; the concern of their authors was plainly to create one more stable element in a new system of international sanctions against aggression.

Whatever developments may follow the Locarno Agreements, it is certain that the problem of security throughout the world will only be solved when satisfactory arrangements have been made for the provision of effective sanctions in support of international law, and that such sanctions can only be effective if they are founded on a combination of the two principles of general and partial guarantees. (See LEAGUE OF NATIONS and bibliography thereto.) (P. J. B.)

**SANDBURG, CARL** (1878— ), American author, was born at Sandburg, Ill., Jan. 6 1878. In 1898-1902 he studied at Lombard College, Galesburg, and in 1910-2 was secretary to the mayor of Milwaukee, Wisconsin. He became associate editor of *System*, Chicago, in 1913, and was also editorial writer on *The Chicago Daily News*. He served in the 6th Illinois Volunteers in the Spanish-American War, seeing active service in Porto Rico. In 1918 he was a member of the editorial board of the National Labour Defence Council. His poetry is distinguished by an intense realism, set off by an abrupt irregularity of line which intensifies its effect. His choice of words is always significant and adds greatly to the force of his verse. He has been termed the laureate of industrial America.

Among his published works are *Chicago Poems* (1915); *Corn Huskers* (1915); *The Chicago Race Riots* (1919); *Smoke and Steel* (1920); *Slabs of the Sunburnt West* (1922); *Rootabaga Pidgeons* (1923); *Abraham Lincoln—the Prairie Phase* (1926).

**SANDFLY FEVER.**—"Sandfly" or "phlebotomous fever" is an acute specific fever, common in tropical and sub-tropical countries. It is caused by a virus, possibly a leptospira, conveyed to man by the bite of a small midge of the dipterous family, Psychodidae. The incubation period is about five days.

**Symptoms.**—The fever is sudden in onset, and of short duration, accompanied by severe headache and pains in the limbs. The attack starts with a general feeling of depression and loss of appetite, soon followed by weakness of the legs, and pains and tenderness in the muscles, especially those of calves and back of neck. The temperature rises rapidly to 102 to 104° Fahrenheit. There is flushing and fulness of face and eyes as though some constriction were being applied around the neck. The bloodshot eye is typical and in some countries has led to the disease being called "dog disease" (Hundfieher). Frontal headache and pains in the eyes and leg muscles are usually severe. The pulse is relatively slow throughout. There may be vomiting and diarrhoea. Rashes are uncommon and are not to be confused with insect bites. A blood examination shows a marked decrease in the number of white blood corpuscles. The temperature usually falls to the normal level within four days, although one- to seven-day types of fever are to be seen. Recovery is slow, depression and other nervous symptoms may persist for weeks or months.

**Treatment.**—The sooner the patient takes to bed the less severe are the pains likely to be. The bowels should be moved by means of calomel, followed by salts. Then the aches and pains may be relieved by the administration of 10 grains of aspirin every four hours, or by half a teaspoonful of liquid extract of opium. Quinine is useless. Hot tea is very soothing for the pains, especially during the night. It is advisable to surround fever cases with a sandfly net to lessen the chance of the infection spreading. Tonics and a change of climate may be necessary during convalescence.

**Etiology.**—While the nature of the causal organism is uncertain, *Phlebotomus papatasi* is the proven carrier of the disease.

Sandfly fever is liable to occur wherever the *P. papatasi* can breed, i.e., where for eight consecutive weeks the mean daily temperature lies between 65° and 90° Fahrenheit.

Epidemics of the fever depend on the number of infected *Phlebotomus*, and the number of susceptible people. Other conditions, such as temperature, humidity, winds and reaction of soil, may modify the prime factors.

**The Virus.**—Doerr in 1909 and Birt in 1910 showed that, in sandfly fever, the blood of man is infective by direct transmission to other men only in the first day of disease. Kilroy in 1909 infected himself by *Phlebotomus* bites, and, by inoculation of his blood transmitted the disease to a non-immune subject. Birt in 1910 showed that the virus could pass through a very fine filter. In 1921 Couvy reported that spirochaetes had been seen in cases of dengue in Beirut. In the same year the Royal Air Force Sandfly Commission isolated a leptospira in six cases of so-called sandfly fever in Malta, while in 1922, Vervoort and Van de Velde, working in the Dutch East Indies, found leptospira in cases of fever resembling phlebotomous fever. However, the correct diagnosis of some of these cases was doubtful, and until further transmission experiments have been carried out this organism cannot be accepted as the causal virus.

**The Vector.**—Doerr and Birt in 1910 claimed that *P. papatasi* which had fed on cases of sandfly fever were capable of transmitting the disease, but only seven to ten days after sucking virulent blood. Doerr suggested that the adult female *Phlebotomus* transmits infection to her offspring.

During the years 1907 to 1922, parts of the bionomics of the sandfly had been worked out, but its life history was not fully elucidated.

The R.A.F. Sandfly Commission, working in Malta and London during 1921, 1922 and 1923, bred the sandfly in captivity and extensively studied the bionomics of this insect. The fever was transmitted to man by the bites of *Phlebotomus* bred in captivity in London, showing that these flies were the true carriers of the disease. Further experiments showed that the infection was handed on from generation to generation of sandfly in its breeding grounds, by the grub feeding on the excreta and dead remains of the parent flies.

*Phlebotomus papatasi* is a small midge measuring about 3 mm. in length; of a very delicate build and thickly covered with fine, long hairs. The body is of a pale lemon tint and shows the morphological characters common to its genus. Eyes are relatively large, black and conspicuous. The antennae are long and filamentous. The proboscis is long and prominent. The fine wings are lancet-shaped, covered with hairs and held erect, except when newly hatched and shortly before death. The female fly has a spindle-shaped abdomen.

The life-history of this fly covers a period of about eight weeks, the exact time depending on food supply, temperature and humidity. The egg stage occupies about nine days; the grub stage about 28 days; and the chrysalis stage about 10 days, ending in the emergence of the adult fly. The wings of the newly hatched fly are crumpled and moist. Until these are dry the young fly can only crawl. The recognition of this stage is most helpful in detecting breeding spots of the insect. During the night, when the atmospheric humidity is usually great, the wings cannot dry. The process of drying is usually completed within three hours after dawn, and the mouth parts are sufficiently hardened to allow of the sucking of blood during the first 24 hours of adult life. Copulation can take place within the next 24 hours, and eggs to the number of 40 are laid 6 to 10 days later. The length of life of the adult female fly in nature is about two weeks, though in the laboratory life may be prolonged for 30 days.

Only the female *Phlebotomus* bites. A feed of blood is essential for the eggs to become fertilised. The insect usually bites after sunset. Man is bitten wherever the skin is exposed. The sandfly progresses by a short hopping flight usually to one side. The distance of a single flight is never more than four yd., and it does not travel more than 50 yd. from its breeding haunts. It is attracted by the odours of man and other animals, and enters buildings by apertures in the walls, windows, doorways, ventilators or cracks. The flight of the *Phlebotomus* is so feeble that it avoids all currents of air, natural or artificial. Upstairs rooms, which are more exposed to air currents, are less infected than those on the ground-floor. In nature the grub and chrysalis forms are found in the cracks in embankments, in the loose earth at the base of walls and buildings, in cultivated soil and in other places where suitable conditions of food, moisture and temperature exist. The grubs are found even to a depth of a foot or more in loose soil, and can migrate to the level of optimum environment. Hibernation takes place in the last grub stage, a very resistant stage. When ready to pass into the chrysalis form, they seek a drier spot, usually within a few inches of the surface of the ground. Excess of moisture is injurious to all stages of the life of this insect.

*The Recipient.*—About 80% of newcomers to sandfly regions suffer from the fever during their first summer of residence, and about 15% develop a second attack within three years. Such factors as atmospheric temperature and humidity affect the development of the virus in man.

*Prevention.*—It is necessary to eliminate the hiding and breeding places of the fly. Cracks in the ground or in masonry must be got rid of by levelling, pointing, etc. Premises must be thoroughly cleansed, and dust and cobwebs removed. Good refuse disposal is essential. The sandfly must be kept away by sandfly proof nets (45 meshes to the square inch), electric fans or repellants, such as paraffin or camphor; whilst insects living in corners of rooms must be destroyed by swatting with a damp cloth or spraying with 1% cresol. There must be a daily war against this pest. All the necessary repairs, tarring, painting and lime-washing must be carried out immediately before the warm weather sets in. Each year the interior of all rooms should be washed down and painted or lime-washed.

Sinton, "Notes on Some Indian Species of the genus *Phlebotomus*," *Indian Jour. Med. Research*, vol. 10, No. 3, vol. 11, No. 4 (1923-4); H. E. Whittingham and A. F. Rook, "Observations on the Life-history and Bionomics of *Phlebotomus papatasi*," *Brit. Med. Jour.*, Part 2, p. 1144 (1923). (H. E. WH.)

**SAN FRANCISCO, Cal., U.S.A.** (see 24.144).—The population increased 21.5% in the decade 1910-20, reaching 506,676 in 1920, when it ranked 12th among the cities of the United States, and was outranked in California for the first time by Los Angeles. The population of the San Francisco-Oakland metropolitan district, however, was still (1920) somewhat greater than that of the Los Angeles metropolitan district (900,921 and 880,653 respectively). For 1925 the census bureau's estimate for the city proper was 557,530; local estimates were considerably higher, over 700,000. The population still had (1920) the frontier characteristic of a preponderance of males (116.6 males to 100 females). The leading nationalities among the 149,195 foreign-born were Italians, Germans, Irish and English; there were 4,497 Chinese, 4,198 Japanese and 3,810 Mexicans. The amount of illiteracy and of child labour was relatively small; the percentage of men employed relatively high; the general death-rate slightly above the average (probably because of invalids from the east); the infant mortality far below the average. San Francisco is the seat of the federal reserve bank for the twelfth district.

*Communications and Commerce.*—Between 1910 and 1925 the Western Pacific Railroad was greatly developed, and important improvements were made by the Southern Pacific and the Santa Fe companies. Traffic by sea greatly increased, especially after the opening of the Panama Canal; the total tonnage of cargoes received and shipped in 1924 (including foreign, coastwise and local commerce) was 11,395,012 short tons. Foreign commerce in 1924 amounted to 3,083,513 cargo tons (imports, 1,244,242 tons; exports, 1,839,271), giving San Francisco eighth place among the ports of the United States. Extensive improvements were made in port facilities: pier space was more than doubled; warehouses were built; and a tunnel was made connecting the government docks and the Presidio with the Belt railway. Passenger and motor traffic across the bay increased beyond the possibility of accommodating it by ferries, and in 1923 the war department gave permission for the construction of a cantilever bridge for vehicular traffic across Carquinez Straits in the upper bay, and of two vehicular bridges across the lower end of the bay. The Bay Shore Highway to San Jose, a boulevard 125 ft. wide, was under construction in 1925.

*Industries.*—Products manufactured in San Francisco were valued at \$133,041,000 in 1909; \$417,321,000 in 1919; \$327,499,417 in 1921; and \$416,317,535 in 1923, when the city stood 15th among the industrial centres of the country. During the World War shipbuilding was very important; in 1919 the output of the yards within the city limits was 11% of the total value of the factory products; in the yards of the metropolitan district 165 cargo ships of 1,553,433 tons were constructed in 1916-20, besides 110 naval craft, including three super-dreadnoughts.

Following a strike of the longshoremen in 1916, which completely tied up the port, the chamber of commerce, at a mass meeting of business men, declared for the principle of the "open shop" in labour relations, and appointed a "law and order" committee, for which an initial fund of \$1,000,000 was subscribed. An ordinance making picketing illegal was secured in Nov. 1916. The organised effort thus begun to establish the open shop, in the city which had long been the greatest stronghold of organised labour, was continued after the War by the industrial association, an organisation of employers formed for the purpose.

*Public Utilities and Building.*—In 1910 a bond issue of \$45,000,000 was voted for the municipal project of bringing water from the headwaters of the Tuolumne river in the Sierra Nevada mountains, 150 m. away; an additional \$10,000,000 was voted in 1924, with \$20,000,000 more still needed. The dam in the Hetch-Hetchy valley was completed in 1923. By 1925 an 18 m. tunnel through the mountains had been completed to Moccasin creek, where the first powerhouse of the system (100,000 H.P.) had been built; the western end of the project also had been completed, including conduits and tunnels across the bay to the Crystal Springs Lakes, in order to make immediately available an additional supply of water from the Mount Hamilton range. Condemnation proceedings were begun in 1913 to acquire the property of the Spring Valley Co., which owns the local distributing system and the reservoir on the peninsula; and in 1922 an agreement with the company gave the city the right to purchase at any time before 1934, at \$38,000,000 plus expenditures for improvements. Up to 1925 the voters had refused to approve the necessary bond issue. On Aug. 14 1925 the Moccasin Power Plant was put into service, with the Pacific Gas and Electric Company as temporary distributor. The net revenue from the power and from the rental of the Bay Crossing aqueduct is sufficient to pay the interest on the outstanding bonds.

With the reconstruction of the Geary Street Railway in 1912, the city government entered the business of local transportation. By 1925 it owned 72 m. of track, and had met all expenses out of earnings while keeping a five-cent fare. An amendment to the city charter in 1920 authorised negotiations for the purchase of the privately owned street railways (286 m. of track) with provisos that the price must be paid out of earnings and that the agreement must be submitted to the electors for approval. A tunnel under the Twin Peaks (about 12,000 ft. long, completed 1917) brought within easy reach of the business sec-

tion a new territory, where several well-planned residence districts of great beauty were developed. The Stockton street tunnel (911 ft.) was completed about the same time. The Dubose tunnel (4,232 ft.), for which bids were received May 5 1926, will serve the Sunset district.

Land for a civic centre was acquired in 1912, and by 1925 it had been improved with a notable group of buildings: a large and well-designed city hall, the public library, the state building and the auditorium which was presented to the city by the administration of the Panama-Pacific exposition. A municipal opera house is to be added soon. A city-planning commission was authorised in 1912, and a zoning ordinance (regulating use of buildings) was adopted in 1921. The building permits issued in the five years 1920-4 represented new construction to the value of \$198,832,000, but there was still a housing shortage. For the fiscal year 1925-6 the assessed valuation of property (on a 50% basis) was \$734,000,000.

**Education.**—After a long and bitter struggle, the charter of the city was amended in 1920 to provide for a board of education appointed by the mayor (but subject to ratification by the electorate), serving with only nominal compensation, who should appoint a superintendent of schools responsible to the board. This superseded a system in which the superintendent was elected by popular vote. Upon the establishment of the new board a comprehensive building programme was mapped out, for which a bond issue of \$12,000,000 was voted in 1923, and by 1925 most of the buildings were under construction.

The *Panama-Pacific Exposition*, celebrating the opening of the Panama Canal, was held in 1915 (Feb. 20 to Dec. 4). There were 80,000 exhibits, valued at \$350,000,000, representing 39 foreign countries and 37 states and three territories of the United States; 800 congresses and conventions were held in connection with the exposition. The attendance aggregated 18,413,399; the average per day was 62,000. Architecture, colour scheme and effective illumination at night combined to make it an artistic success. Financially, there was a final net profit of about \$1,000,000. It left to San Francisco as a permanent heritage not only the municipal auditorium at the civic centre, but the Marina Park lands, extending along the Bay for eight blocks between Fort Mason and the Presidio, and the Palace of Fine Arts with the surrounding park lands of 20 acres.

**Government.**—James Rolph, Jr., elected mayor in 1911 as a "reform" candidate, was still in office in 1925, with two more years of his fourth term to run.

**SAN GIULIANO, ANTONINO PATERNO-CASTELLI**, MARQUIS DI (1852-1914); Italian statesman, was born at Catania Dec. 10 1852, a member of a noble Sicilian family. After graduating in law at the university of Catania he became, in 1879, Mayor of his native city, and in 1882 was elected to Parliament. When in 1892 Sig. Giolitti became premier, San Giuliano was selected as under secretary for agriculture, while in the second Pilloux Ministry (1899-1900) he held the portfolio of posts and telegraphs. Having been defeated at the election of 1904, he was nominated senator. When in Dec. 1905 Sig. Fortis became prime minister he was appointed minister for foreign affairs, and on the fall of the Cabinet early in 1906 he was appointed Ambassador in London, where he remained until 1910. From London he was transferred to Paris, but he soon returned to the Consulta as foreign minister in the Luzzati Cabinet (1910-1), and continued at the same post in Sig. Giolitti's administration. San Giuliano was an ardent believer in the Triple Alliance but having retained his portfolio under Salandra, after Giolitti's resignation in March 1914, he carried out with complete loyalty the policy of neutrality adopted by Italy on the outbreak of the World War. He died in Rome on Oct. 16 1914.

**SAN MARINO** (see 24.153) had, in 1920, a population of 12,069. The peaceful revolution of March 25 1906 had restored the original system of election to the council (which had become a close corporation, renewed by co-option) by the Arengo, or assembly of heads of families, one-third of the council being henceforth renewable every three years. But in Sept. 1920 the council resigned in a body and enlarged the Arengo into a single

constituency, electing the 60 councillors under practically universal suffrage and proportional representation, illiterates not being disqualified.

The march of democracy at San Marino is shown by the figures of the general election of 1920, when 2,352 persons voted as compared with the 802 heads of families who polled in 1906. San Marinese public life takes its colour from Italy; thus, the Catholic Popular party there, as in Italy, was powerful in 1920, and Socialism, imported from abroad, was largely represented, while Fascism has appeared. Pending the election of their successors after the vote of 1920, the two half-yearly presidents of the republic, for the first time since 1787, remained in office after their six months' legal tenure had expired, and, for the first time since 174c, the new Capitani Reggenti came into power on Dec. 5 instead of Oct. 1 or April 1, the time-honoured dates, a return to which was effected at the ensuing election of presidents.

**Effect of the War.**—The World War affected even this neutral republic. The Germans accused it of espionage through the wireless station on Monte Titano, which stands 2,437 ft. above the sea. The republic refused, however, to receive the threatened commission of inquiry. When Italy entered the War, San Marino showed its sympathies by voting £1,500 for the Italian sufferers, and one of the regents publicly expressed his hope for an Italian victory. Some amusement was caused by the order of the council of the League of Nations in Rome in 1920 that its permanent military commission should inquire into the "military and naval forces" of this landlocked republic.

**Relations with the Powers.**—San Marino has been since 1862 in treaty relations with Italy, and the Italian ex-premier, Sig. Luzatti, acted as its adviser. In 1911 it had a separate pavilion at the Rome exhibition; in 1921 the flight of Bolsheviks into the republic, and the "punitive expedition" of the Fascisti in search of them, led San Marino to invoke the aid of the Italian Carabinieri, who were placed under the republic's authority. With Great Britain San Marino, which has a consul-general in London, signed an extradition treaty in 1899, and sent an envoy to Edward VII.'s coronation; correspondence passed between George V. and the regents on the death of Edward VII.; and in 1919 a celebration in honour of "our smallest ally" was held in London.

The republic no longer confers titles for a consideration, but finds a fruitful source of revenue in the frequent changes of its postage stamps (first issued in 1877 and divided into two series, one for foreign and the other for internal postage, in 1899). However, it has had to resort to a loan, and new taxes were imposed to provide higher salaries for officials, causing the peasant rising in 1910. But it has steadily refused the offer of a gaming-table. In recent years newspapers have been published. The only exports, besides postage stamps, are stone from Monte Titano—the legendary founder of San Marino was a Dalmatian stone cutter—and the strong wine grown on this volcanic soil. The museum contains among other curiosities the banner of Garibaldi's "Italic Legion," which sought refuge at San Marino in 1849. The archives were rearranged and described by Malagola. The present Government House, built from the designs of Azzurri, and inaugurated with an address by Carducci in 1894, is a handsome building, and a fine statue of the republic adorns the Pianello. The cold climate should make San Marino a good summer resort now that it is connected with Rimini by motors. Education is provided at the Belluzzi College, founded in 1691 and refounded in 1883, and the republic has produced two native historians.

Marino*, 6th ed., edited by O. Fattori (1912); *Verbale del Consiglio Grande e Generale della Seduta, 18 Settembre, 1920* (S. Marino, 1920); W. Miller, "Democracy at San Marino," *History*, vol. 7 (April 1922). (W. Ml.)

**SAN REMO, CONFERENCE OF** (April 19 to 26 1920).—This conference was preceded by a meeting of the Supreme Allied

Council (Mr. Lloyd George, M. Millerand and Signor Nitti) from Feb. 12 to 23 in London, where the main lines of the future Treaty of Sèvres with Turkey were laid down, and the draft treaty with Hungary and the Fiume question were discussed. At San Remo itself, where the three statesmen above mentioned were joined by representatives of Greece, Belgium and Japan, the Turkish Treaty was the first and principal business dealt with, and the framework of the Sèvres Treaty was there constructed. The mandates for Syria, Palestine and Iraq were assigned to France and Great Britain respectively, and an Anglo-French Oil agreement was negotiated which covered Rumania and the French and British non-self-governing colonies as well as the Middle East. The most controversial question dealt with, as between the Allies, was that of the maximum strength of the German Army, both as to its total and as to the number of troops allowed in the neutral zone skirting the area under Allied occupation.

During the preceding month the reactionary *Putsch* organised by Herr Kapp had temporarily driven the Republican Government from Berlin; the swing of the pendulum had produced a Communist rising in the Ruhr, with which the Republican Government had come into armed collision; the Government had dispatched against the Communists (whose outbreak happened to have occurred in the neutral zone) more troops than were allowed in this zone under the Versailles Treaty; France had retaliated by occupying Frankfurt and Darmstadt without consulting her Allies; and Great Britain had protested against this sharply. In these circumstances the German Govt. asked the San Remo Conference to sanction the doubling of the maximum strength for the German army as fixed by the Versailles Treaty. In a joint declaration made at San Remo the Supreme Allied Council refused this request and charged Germany with default in respect not only of disarmament but of reparation. At the same time they announced their intention of inviting the heads of the German Government to a direct conference. (See SPA, CONFERENCE OF.) (A. J. T.)

**SANTAYANA, GEORGE** (1863– ), American philosopher and writer, was born in Madrid, Spain, Dec. 16 1863. At the age of nine he went to America and was educated at Harvard (A.B. 1886; Ph.D. 1889), where he taught from 1889 to 1912 as instructor, assistant professor, and, after 1907, as professor of philosophy. He then retired to devote his time to literary work. In 1905 he was Hyde lecturer at the Sorbonne. As an essayist he attained a high position in American letters, being one of the acutest opponents of the pragmatic attitude in matters of conduct and education. To the most abstruse subjects he never failed to bring an acid wit and a romantic beauty of style. His chief work is *The Life of Reason: or the Phases of Human Progress* (1905-6), 5 vol., entitled respectively *Reason in Common Sense*; *Reason in Society*; *Reason in Religion*; *Reason in Art* and *Reason in Science*.

His other writings include: *Sonnets and other Verses* (1896); *Lucifer, a Theological Tragedy* (1899); *A hermit of Carmel* and other poems (1901); *Three Philosophical Poets* (1910); *Winds of Doctrine*; *Studies in Contemporary Opinion* (1913); *Egoism in German Philosophy* (1916); *Character and Opinion in the United States*; with *Reminiscences of William James and Josiah Royce*, and *Academic Life in America* (1920); *Soliloquies in England* (1922); *Poems* (1923); *Scepticism and Animal Faith* (1923); *The Unknowable* (Herbert Spencer lecture, Oxford, 1923); and *Dialogues in Limbo* (1925).

**SANTIAGO**, Chile, the capital of Chile (see 24.191), had a population of 507,296 at the census of Dec. 15 1920, an increase of 52.5% since 1907 (332,724), compared with an increase of only 21.2% in the same period for the province of Santiago outside the city, and 15.6% for the entire country. As the natural increase of the population is small (3.3 per 1,000 of the province of Santiago, 1923) and immigration had been inconsiderable, it is evident that the growth of the capital was due largely to migration from the smaller towns and rural districts. The city had 9.5% of the entire population of the country in 1895, 10.2% in 1907, 13.5% in 1920. Birth-rates and death-rates both are excessive (37.7 and 34.4 per 1,000 respectively for the province of Santiago in 1923); 38-40% of the births are illegitimate.

While Santiago remained primarily the political and cultural centre of the nation, its importance as a commercial and industrial metropolis increased. There were many wholesale firms, doing a large business in cattle, hides and other agricultural products. Chilean manufacturers received a stimulus from the dislocation of international trade during and after the World War, and by 1923 Santiago had over 1,300 industrial establishments, with a capitalisation of 163,000,000 pesos. Among the leading industries were breweries, flour-mills, foundries, machine-shops, woodworking plants, tanneries, knitting-mills, soap factories, factories for making shoes, hats, umbrellas and various articles of clothing. There was a rapid development in labour organisation, and the chronic shortage in the labour supply persisted.

By 1925 Santiago was described by travellers as one of the most beautiful cities of South America, with all the characteristics of a modern capital; fine public buildings and private residences, broad avenues, well paved and well lighted streets, and modern conveniences of every sort. Among the new buildings were the Palacio de Bellas Artes, in the Parque Forestal; the national library then under construction, for which a site was purchased in 1913; the Agronomical Institute and the School of Engineering; and two banks of steel construction. The electric tramway and lighting company, which before the War had been in German hands, was reorganised as a Chilean enterprise. It constructed hydroelectric projects at Santiago in 1921, and secured the contract for supplying power to the railway from Santiago to Valparaíso after its electrification, as well as for lighting the city and running its tramcars. In Oct. 1924 the Government granted a concession to a local firm for the construction of an underground way through the centre of the city (9 km. long, 10 metres below the surface). The water supply was increased by bringing water from Laguna Negra in the Andes, 53 km. away. The fifth international conference of American States was held in Santiago March 25 to May 3 1923.

**SANTLEY, SIR CHARLES** (1834-1922), British singer (see 24.194), published *The Art of Singing* (1908) and *Reminiscences of My Life* (1909). He died in London Sept. 22 1922.

**SANTO DOMINGO** (see 24.195), a West Indian republic on the eastern portion of the island of Haiti. Estimated area, 19,332 square miles. The first census of the republic ever taken was completed by the military government in 1921, when the population was declared to be 897,405. The estimated population in 1923 was 708,000. The inhabitants are mostly of mixed European, African and Indian blood, though there are some creoles of Spanish descent. Santo Domingo, the capital, had a population of 30,957 in 1923; Santiago de los Caballeros, 17,052.

## I. POLITICAL HISTORY

The assassination of President Ramón Caceres on Nov. 19 1911 brought to an abrupt end the internal peace that was hoped to follow from the fiscal treaty of 1907. Gen. A. M. Victoria, the dominant military figure, secured the selection of his uncle Eladio Victoria as president. Revolutionary outbreaks followed, and the United States President appointed a special commission to help establish order. As a result Victoria was induced to resign, and Archbishop Nouel was chosen provisional president. Further political disturbances developed, and Archbishop Nouel resigned on March 31 1913, the national congress selecting Gen. José Bordas Baldez as provisional President. Once more revolutionary outbreaks prompted the United States to proffer its good offices, and on the advice of the American commission Baldez resigned and Dr. Ramón Baez was elected provisional president on Aug. 27 1914. In Oct. of the same year the former president, Juan Isidro Jiménez, was chosen constitutional president, and a period of peace and prosperity followed until April 1916, when Gen. Desiderio Arias precipitated a revolution by marching on the capital. He seized military control, swept aside the aged president Jiménez and proceeded to assume the executive power. His plans were thwarted by the United States Govt., which dispatched an army of occupation to Santo Domingo in May 1916. Jiménez resigned office and retired to Porto Rico, and the

American commander promptly suppressed Arias. The complete pacification of the interior was rapid, and was effected without any serious resistance.

On July 25 1916 the Dominican Congress selected Dr. Francisco Henríquez Carvajal as temporary president. The United States, refusing recognition until assured of the non-recurrence of civil disorder, proposed a new treaty based upon the convention adopted between the United States and Haiti (*q.v.*), which should provide for the collection of customs under American auspices, the appointment of an American financial adviser and the establishment of a constabulary force officered by Americans. On the refusal of President Henríquez to enter into this arrangement, the American authorities proceeded to withhold from the Government all the revenues collected by their officers. When Henríquez announced his intention not to retire from the presidency upon the expiration of his provisional term, but to present himself as a candidate for popular election, the deadlock threatened to continue indefinitely. On Nov. 29 1916 Santo Domingo was placed under the military administration of the United States. Executive departments were taken over by American naval officers, ex-president Henríquez left the country, order was quickly established and Santo Domingo entered upon four years of civil quiet and economic improvement.

On July 11 1922 the Department of State at Washington announced a plan for the termination of the military government in Santo Domingo. A special commissioner to the Dominican Republic was appointed to make the plan effective. On Oct. 21 1922 Juan Bautista Vicini Burgos was installed as provisional president to hold office during the period necessary to carry out the proposed plan of evacuation and to re-establish a Dominican constitutional government. The executive officers of the military government continued on duty in Santo Domingo to assist the provisional government during this time. On July 12 1924 General Horacio Vásquez was inaugurated constitutional president of the republic, having been chosen at the elections held on March 15 1924. Control of all fiscal and administrative affairs was again placed in Dominican hands, with the exception of the customs service, which continued to be administered by officials nominated by the President of the United States. The treaty with the United States for the withdrawal of the American forces was ratified by the Dominican Congress on June 26 1924, and on Sept. 17 the last of the American marine forces of occupation left the republic.

**Education.**—Primary education is compulsory and free. The Government educational scheme comprises primary and secondary schools, technical and training colleges. By a presidential decree of Nov. 29 1914 the professional institute was raised to the rank of a university. There were 972 public schools in 1920, with 105,000 pupils; in the same year the government expenditure on public instruction was \$966,952. The period of American occupation was marked by the building of schools and the extension of educational facilities. In 1924 the Dominican Govt. made provision in the budget for the establishment of 300 schools in the republic, and legislation provided that the tax *impuesto de Patentes* should be used for educational purposes.

## II. FINANCIAL AND ECONOMIC HISTORY

**Finance.**—Political disturbances delayed the course of financial extrication ensured by the convention of 1907, but after 1916 rapid progress was made. Of the \$20,000,000 loan of 1907 there was on Dec. 31 1924 an outstanding liability of only \$3,868,716, which was to be paid off before 1929. The total bonded debt of the republic on Dec. 31 1924 was \$13,534,276.

One of the first acts of the new Government was to negotiate a convention with the United States to replace the convention of 1907. In effect, this proposed convention followed the lines of the convention of 1907, authorised the Dominican Govt. to issue \$25,000,000 in bonds, and provided for the appointment by the President of the United States of a general receiver and the necessary assistants to collect the customs duties in the republic and to allocate to the interest and sinking fund of the bond issue the necessary amounts. This convention was signed in Washington on Dec. 27 1924. It was ratified by the United States Senate at that session, and its ratification by the Dominican Congress was approved by the president of the republic on May 25 1925.

During 1924 the customs receipts were \$4,386,602 as against \$3,596,166 in 1923. The internal revenue for 1924 was \$2,998,686 as against \$2,575,055 in 1923. Deposits in the savings banks during

1924 showed an increase on those for 1923. Estimated receipts for 1925, according to the budget promulgated Dec. 28 1925, were \$11,968,110, leaving after certain deductions an available balance of \$6,006,840.

**Production and Industry.**—Agriculture is the chief source of wealth in the republic, the cultivation of sugar taking first place amongst the industries. Cacao, tobacco and coffee are the other staple products. From 1912 to 1914 the increase in production was arrested, but in 1915 production went up. The military occupation and high prices caused by the World War maintained high export values through 1920, when record prices were reached, to be followed by an abrupt reaction. The 1924-5 sugar crop at 340,870 short tons exceeded the estimate by 21,722 short tons. Cocoa exported in 1924 was 23,142,478 kilos, as against 19,830,722 kilos in 1923. The value of the 1924 heavier exports at \$2,793,502 was less than that of the 1923 exports, which were valued at \$2,917,165. Exports of coffee increased in value from \$427,588 in 1923 to \$863,531 in 1924. Sugar and molasses exports in 1923 were \$19,042,067, compared with \$22,484,651 in 1924. Imports and exports for the years 1914 and 1924 were:—

|         | 1924         | 1914         |
|---------|--------------|--------------|
| Imports | \$21,580,571 | \$ 6,729,007 |
| Exports | 30,262,896   | 10,588,787   |

63.73% of the import and 30.68% of the export trade being with the United States in 1924, as compared with 59.29% and 52.31% respectively in 1911. The chief imports in 1924 were cotton goods, foodstuffs, manufactures of iron and steel and oils.

**Communications.**—During the American military occupation a number of much-needed highways were constructed, of which 405 m. of highways had been completed by 1924, 96 additional m. were under construction, with a further 452 m. projected.

A government owned telephone system operates over 1,034 m. of lines, with telephonic connection with the republic of Haiti. In 1924 there were wireless stations at Santo Domingo and at La Romana; the latter was opened to foreign traffic in 1912.

(J. H. Ho.)

**BIBLIOGRAPHY.**—Reports of the Council of the Corporation of Foreign Bondholders (London, annual); S. Bonsall, *The American Mediterranean* (1912); C. A. Nouel, *Historia Eclesiástica de la arquidiócesis de Santo Domingo*, 2 vol. (Rome, 1913); C. L. Jones, *Caribbean Interests of the United States* (1916); *The Constitution of the Dominican Republic of 1908* (San Domingo, 1918); O. Schönrich, *Santo Domingo: the Country with a Future* (New York, 1918); A. Rodríguez, *La Cuestión Dominico-Haitiana; Estudio Geográfico-Histórico* (San Domingo, 1919); C. N. de Moya, *Bosquejo Histórico de la República Dominicana* (1919); U.S. Navy Department, *Santo Domingo, its Past and its Present* (1920); *Report of Inquiry into the occupation and administration of Haiti and Santo Domingo*, before select committee of the U.S. Senate (1922).

**SANTOS** (*see* 24.196), population 101,000, has made notable progress since 1910. An annual rainfall of about 77 in. and a mean temperature of 69° F., combined formerly to create unhealthy conditions, but the building of a series of drainage canals, extension of modern sanitation, paving of streets, construction of better business and dwelling houses, port improvements, all representing an outlay of millions of pounds, are largely responsible for the change to a healthful city. A suburban seaside resort, Guarujá, with new hotels, now draws many visitors from inland parts of Brazil.

Santos has passed Rio de Janeiro in the amount of its exports and is now the world's greatest coffee port, shipping annually from 8,000,000 to 13,000,000 bags. The annual imports have increased in 20 years from about 500,000 to 1,500,000 tons. About 1,500 ships visit the port yearly, the busiest season being from Aug. to January. New docks extend for three miles and can accommodate 50 steamers at one time; belt conveyors operated by steam load several thousand bags of coffee per hour. Many warehouses are splendidly equipped with machinery which replaces manual labour. The British-built railway to São Paulo ("Heart of Coffee Land"), 40 m. distant, transports the bulk of coffee of that region to Santos, making the line the best paying railway in South America. A congestion of rail traffic at times has been pronounced and plans are proposed for additional facilities. Motor trucks are gradually replacing horse-drawn carts. A good highway from São Paulo to Santos was completed by the state government in 1919. (W. A. R.)

**SÃO PAULO** (*see* 24.200), capital of the State of the same name in Brazil, and its commercial and industrial centre, grew very rapidly between 1900 and 1925, especially after the close of the World War. In 30 years the population increased ninefold, reaching 579,033 according to the census of 1920, and was estimated at

about 625,000 in 1925. The high rate of natural increase (as indicated by a birth-rate of 40.8 and a death-rate of 20.5) was supplemented by a considerable immigration, Italians leading among the foreign population, followed by Germans, Portuguese, Spaniards, French and English. Manufactures (especially textiles and clothing, hats, boots and shoes, machinery and other articles for home consumption, and meat products for export) were greatly stimulated by the War and, in a few years, the annual output was valued at \$20,000,000. In 1923 four large packing-plants were in operation near the city, with an output valued at 89,799,210 milreis (1 milreis = approx. 50 cents). With the increase in business the old and narrow streets in the business quarter of the city became seriously congested.

#### SÃO SALVADOR: *see* BAHIA.

**SARGASSO SEA.**—The portion of the Atlantic Ocean extending from Bermuda to the Azores, bounded approximately by 25° and 30° N. and by 38° and 60° W. is termed the Sargasso Sea, because of the prevalence throughout this area of the weed known as *Sargassum bacciferum*. This plant, floating on or near the surface, is about one foot in length and consists of a single layer of feathery branches of varying degrees of yellow in colour. Scattered among these branches are numerous globular air bladders or capsules, the size of a large pea. The term "Sargasso" is derived from two Portuguese words, signifying the sea of the little grapes—having reference to these air capsules. The weed is not matted, but is always found floating nearly free, only sufficiently entangled for the mass to keep together, with long lanes of open water between the masses. The weed-infested region, though it apparently expands and contracts at uncertain times through unknown causes, is approximately one-third the size of the United States, and within this area is found a highly specialised and unique series of pelagic animals. Though large in point of numbers, only 15 species have been met with, for the most part distinct from normal pelagic fauna.

The Sargasso Sea was discovered by Columbus on his first voyage and received from him the name of the *Mer de Sargasso*. Geographers, sailors and scientists have varied greatly in their estimates respecting the extent and density of the area of weed, and also as to its source and propagation. Some have stated that many of the branches show signs of having been attached to rock and that the individual plants have travelled a great distance, since in a large proportion of instances only a part of the weed is living. From these facts the suggestion is made that the weed is torn off from the Bahamas by the force of the waves and is then caught in the eddy of the great system of Atlantic currents. On the other hand it has been maintained that the weed propagates itself in the high seas. Again, the statement has been made that the weed is so dense at times as to be an obstruction to navigation, whereas others have affirmed that it offers no resistance to ships, and even its very existence has recently been denied. The widely credited possibility of ships becoming embedded in the weed, and being unable to escape, is disproved by the expedition of the "Michael Sars," under the direction of Sir John Murray and the Norwegian government in 1910, which found the surface covered with weed only in patches. It would appear that at times the weed sinks, remaining suspended 12 or 18 in. below the surfaces of the water, and this phenomenon may have given rise to the divergent opinions met with.

Other similar tracts exist covered with floating weed, *e.g.*, in the solitary part of the Pacific, north of the Hawaiian Islands, between 30° and 40° N. and between 150° and 180° W. There is a smaller tract southeast of New Zealand and along a belt of the southern ocean extending from the Falkland Is., south of Africa and southwest of Australia, similar floating banks of weed are discovered.

**SARGENT, JOHN SINGER** (1856-1925), Anglo-American painter (*see* 24.219). For 40 years before his death John Singer Sargent was too towering a personality for his contemporaries to judge either him or his work in true perspective. A tall and commanding presence, with a small head well set on broad shoulders, with large, somewhat prominent grey eyes, kindly

in expression though nothing escaped them, with a close-cut beard at a time when nine men out of 10 were clean-shaven, he made an instant impression upon those who came into contact with him. During the last years of his life, especially, with his great size, his dark hair and beard turned silver-white, his complexion florid, and an air about him of singular freshness and calm, he had a look as of some serene and beneficent Jove.

That he was a great artist is universally acknowledged, but that he was a great man his life attested—in its austerity, its generous highmindedness, its breadth of vision, and above all in its independence of praise, fame or wealth. Essentially a cosmopolitan, he was of American descent. He appreciated with amusement the anomaly of his own situation, claimed as he was by two countries—the land of his immediate forefathers, the land of his adoption.

His record of extraordinary good fortune was based as much upon character as upon incidental circumstance. The simplicity of his aim was a citadel of strength. He knew what he wanted, and any distraction, however tempting, that interfered with his object he summarily brushed aside. Yet he was in no sense an ascetic. He had a vigorous relish for good plays, good music, good books, good company. His movements were deliberate, he never seemed to hurry; but it was always a question whether his self-control did not consist rather of the coolness of the born fighter than of the phlegm of a somewhat contemptuous philosopher.

He himself would have said that he was most fortunate in the choice of his parents. His father, Dr. Fitzwilliam Sargent, was born in Gloucester, Massachusetts, where his ancestors, emigrating from Gloucester, England, settled before 1650. For his medical training Fitzwilliam Sargent went to Philadelphia, practised there for a short period and married Miss Mary Newbold Singer, a member of an old Philadelphia family. In 1854 (Mrs. Sargent not having recovered from the death of her first child) the young couple, with Mrs. Sargent's mother, went for change of air and scene to Europe, with no premonition that this journey would result in their permanent establishment abroad. Two years later, on Jan. 12 1856, in Florence, at the Casa Arretini, on the Lungarno Guicciardini, their son, John Singer Sargent, was born. He showed his special aptitudes from his earliest childhood, which was spent at Nice, in Rome, in Dresden, with periodical returns to Florence. Whenever possible he took drawing lessons of a desultory kind, interrupted by the exigencies of schooling and a life of constant travel. His mother, who herself loved to sketch in water-colours, recognised and encouraged his unusual gifts.

His own awakening to the enchantment of being able to express his delight in the visual world came to him, he once mentioned, at Müren, with his closer acquaintance with mountains, in the summers of 1868 to 1870. His early drawings were carefully painstaking efforts to show every variation in rock forms, or in the verdure that sprang from their crevices. This creative ardour, this eagerness to attack a difficult problem, were characteristic to the last day of his life. In 1873 he won a prize for drawing at the Accademia in Florence.

In 1876 he paid the first of many visits to America, but before the short interruption of this trip he had begun his artistic education in earnest, having entered the studio of Carolus Duran, in Paris, in 1874, at the age of eighteen. Rarely, if ever, was a student better equipped for his profession. Travel had enriched a naturally receptive and keenly observant mind. He had absorbed beauty in landscape, pictures, music or architecture as instinctively as he breathed, and extensive reading had made each place of sojourn live for him with all the intensity of the immediate as well as of the remote past.

A fellow student described him as a tall, slenderly built, rather silent youth, with a friendly, somewhat shy manner, who could, on occasions, in spite of his diffidence, express himself with startling decision. Mature for his years, he was never inclined to exuberance, and was more the amused observer than a participant in the riotous diversions that varied the routine of student life in Paris. His industry was no less remarkable

than his physical strength, his youthful powers of endurance not being unduly taxed by the strain of attending not only the class at Duran's studio, but the Beaux Arts and an evening life class as well.

Contrary to many published recollections, Sargent himself declared, perhaps with characteristic modesty, that he was by no means a brilliant pupil, that he was considered, at first, somewhat dull and slow, and that he only acquired his amazing technical skill by continued concentrated effort. What he did recognise, with instant appreciation and lifelong acknowledgment of his debt, was the scientific precision of the method taught by Carolus Duran, who had occupied himself deeply with questions of technique. Duran had based his own theories on a close study of Franz Hals and Velasquez. He believed that painting was a science necessary to acquire in order to make of it an art. Few painters have the stamina to remain faithful to principles at once so precise and so arbitrary, where a slip invites disaster, and an error in one particular the failure of the whole. John Sargent, not without struggle, made this technique his own, and it gave him, at the start, the assured mastery of his materials, enabling him to devote all his energies to more engrossing problems.

His first picture exhibited in the Salon of 1878 won an honourable mention. It was called "En Route Pour La Pêche," and is now in the Corcoran Gallery at Washington. In the next year's Salon he showed the portrait of his master, which he had painted in 1877, at the age of 21, and which was instantly acclaimed as of extraordinary promise. Shortly after, emancipated from schools, he made a pilgrimage to Spain, which he had already visited as a boy, and the studies done in the Prado Gallery, which, after his death, were sold at Christie's at such phenomenal prices, were painted on this occasion. Some were quite small, some of the size of the originals, and all were interpretations rather than copies.

Immediately after his return to Paris he painted the beautiful canvases "El Jaleo" (Salon 1882), now at Fenway Court, Boston and "The Children of E. D. Boit" (Salon 1883), now in the Boston Fine Arts Museum. Of "The Lady of the Rose" (Miss Burkhardt), which was shown in 1881 and gained a second class medal, Henry James wrote that it was the work of "a talent which on the very threshold of its career has nothing more to learn." This was a phrase, for to the end of his days Sargent remained the student, making ever briefer the span between brain and hand, between conception and achievement; yet these early canvases are remarkably mature, with a suave beauty of surface texture he rarely excelled, and with the added sense of atmospheric reality, the "quality" he had learned from Velasquez. He had the special readiness of genius to absorb great traditions, to take valuable hints from every source, and incorporate them into his own work with the freshness and vigour of a deeply original mind.

From the outset commissions came to him unsought. He had to knock at no doors; but it was not till the Salon of 1884, when he showed the portrait of Madame Gautreau (Metropolitan Museum of New York), that the painter awoke to find himself famous—or infamous. Madame Gautreau was the friend of Gambetta, acclaimed by the Republican party, and Sargent was accused of having purposely done a caricature. The journalists outdid each other in senseless abuse.

This experience, with its astounding unreason, its venomous personal bias, probably laid the foundation for his almost incredible independence of all critical comment. Irritated by adulation, detesting every form of publicity, he could never be induced, unless it was forced upon him, to read any criticism of his own work, appreciative or the reverse.

So furious and so prolonged was the outcry in the French Press that finally, in a fit of disgust, Sargent left Paris and moved to London. His first studio was in Kensington, but in 1885 he had already settled at 33 Tite Street, Chelsea. In 1901 he bought the adjacent house (No. 31), and a door was cut through between the two studios. Here he lived and worked till his death on April 15 1925.

Into these 40 years of his London domicile was crowded the experience of a dozen ordinary lifetimes. His first exhibited study of childhood: "Carnation, Lily, Lily, Rose," was bought in 1887, by the Chantrey bequest, for the Tate Gallery. A few years later the Luxemburg acquired the picture of the Spanish dancer "Carmencita," painted 1890, shown at the Royal Academy 1891. In spite of adverse criticism, it was not long before he was in great demand as a portrait painter, and the unflagging zeal of his industry kept pace with every triumph of public recognition. He numbered among his sitters princes and princesses, musicians, actors, teachers, writers, statesmen and diplomats. Many of his distinguished models he painted in their habit as they lived. The great groups of "The Duke of Marlborough and his Family" (1905), the "Ladies Acheson," (1902), the "Daughters of the Hon. Percy Wyndham" (1900), the "Misses Hunter" (1902), etc., and a noble series of single portraits, notably those of the Duke and Duchess of Connaught (1908), the Duke (1901) and Duchess of Portland (1902), Lord Russell of Killowen (1900); of Francis Penrose, Esq. (1898), and of innumerable beautiful women: The Duchess of Sutherland (1904), the Countess of Warwick (1904), Lady Agnew (1893), Lady (Ian) Hamilton (1866), Mrs. Hammersley (1893), increased his ever-growing prestige.

In 1894 he was elected an associate, in 1897 to full membership of the Royal Academy, and at the exhibitions at Burlington House his portraits were the centre of interest and of controversy. It became a high distinction to be painted by him, and hundreds clamoured for the honour in vain. Universities offered him degrees, he had as many medals as a war veteran. Quite unmoved by all this acclamation, he retained the serene simplicity of manner that made him so exceptional and so distinguished a figure. Yet people, even his friends, went in secret awe of him.

In the sense of being generally understood John Sargent was never a popular painter. Painting is the most outspoken of the arts, but its language is not easy to read. Its apparent simplicity and the directness of its appeal to the eyes are misleading, and in the case of pictures so incisive and brilliant, so uncompromising in their truth, so unerring and authoritative in their presentation of character, it was no wonder that they awakened as much resentment as admiration. Sargent chronicled his enjoyment in no uncertain tone; like music made visible, each brush stroke seemed to resound, like a note on the violin, ringing and clear. There are mysteries of light, as well as of darkness, and the secrets of this accomplishment were no less inscrutable, became actually more tantalising, because the method of expression was so frank, and looked so unexpectedly, amazingly easy to imitate. And he was imitated, inevitably, but in no single instance with any distinction. His own processes were individual. He made no concessions to popular prejudice. His inspiration was peremptory and knew few ingratiating moods. Referred to as a psychologist or a satirist, he was frequently accused of deliberately accentuating the less pleasing qualities in his sitters—a foolish legend he dismissed with a shrug of his shoulders. "I chronicle," he once said, "I do not judge." Though his outlook on life was essentially indulgent, his sense of humour was irrepressible, and the unerring rectitude of his realism struck at a deep-rooted human weakness—a preference to be seen not as we are but as we should like to be.

In that its conclusions are so little deliberate painting differs from literature. John Sargent did not sum up his characters, he painted what he saw; but he caught, subconsciously perhaps, each fugitive betrayal of a passing thought, a restless movement, a smile or a glance. This subtle power of definition has been, in all ages, the peculiar gift of great portrait painters.

In recalling the astonishing variety and scope of his work, it may be assumed that he was almost indifferent to the form in which he was called upon to portray the modern spirit. His only prayer must have been that that spirit should not be utterly commonplace. For dullness he had no talent, even his magic touch failed to enliven it. Before the strange, the unexpected, the bizarre, his resource and his freshness were unailing.

No happy invention was permitted to degenerate into a formula. He never repeated himself. For the extremes of youth and of age he had undeniable tenderness; with incredible delicacy he portrayed the flower-like freshness of one, and if he did not disguise in the other the hint of decrepitude it was generally illumined by more than a suggestion of wisdom and dignity.

At the very height of his fame, in 1910, he decided to give up the painting of portraits. This decision, so typical of his artistic integrity, he lived up to. He was his own severest critic. He had grown tired of the tyranny of sitters, and had begun to lose interest in his work. He pulled himself up sharply. Only in exceptional instances was he afterwards induced to break his rule, and then never for considerations of money. Though he lived on a generous scale, he was never a wealthy man. Always ready to give a helping hand to a student, or to a brother artist, he was at once too busy and too impatient of all forms of implied superiority ever to want to teach. Deliberately then, perhaps, he set his face against the scattering of his energies over too wide a field. An omnivorous reader and a passionate musician, an excellent host and a most entertaining guest, his rare leisure was all too adequately filled.

In a holiday spirit he began to play with water-colour (in which medium he had made his earliest efforts at painting) and the result of his first summer of freedom may be seen in the sparkling brilliance, the irresistible gaiety of the 80 sketches bought *en bloc* by the Brooklyn Fine Arts Museum. His disciplined hand had acquired an almost miraculous lightness and certainty of touch.

But a heavier task had already for years been engaging his energies, and the last 20 years of his life were given more and more to the magnificent series of decorations which illustrate the range of his great gifts. It was said of his "History of Religion," begun in 1890 and not completed till 1916 (the subject for the great Hall in the Boston public library known as Sargent Hall), that his work here was not only a monument to the picturesque possibilities of his colossal subject, but to the sheer erudition of the painter. This task took him on several journeys to Egypt, Palestine, etc., as well as for a few months almost every year to America, where he had a studio in Boston, in the Columbus Avenue Building; and he had also another studio in London, for these huge decorations, at The Avenue, 75, Fulham Road.

In 1914, at the outset of the War, he was on holiday in Austria, and he witnessed with horror the disintegration of the Europe he had known. He gave without stint; and when the opportunity offered went to the front to record his impressions at first hand. In his famous war picture "Gassed" (London War Museum) he testified to his deep admiration for the invincible pluck of the British soldier. In the background, through the waning light of the late afternoon we see a football game going on; the ground is carpeted by writhing figures; while a tragic procession of wounded men, blinded by gas, staggers towards the dressing station.

The quieter life in London suited his temperament better than the more buoyant, distracting, lavish social exactions of Boston. In London finally he was to know an honour no living painter had hitherto experienced. The magnificent series of portraits, bequeathed to the nation by Asher Wertheimer, were hung in the National Gallery. A wing in the Tate Gallery, the gift of Sir Joseph Duveen, will one day house these, and such other works by Sargent as are already in national possession—the portraits of Lord Ribblesdale (1902), of Coventry Patmore (1895), of Henry James (1914), Octavia Hill (1899), of Ellen Terry as Lady Macbeth (1899), and many others. Sargent is represented in the principal galleries of the world, but the Metropolitan in New York, and the Boston Fine Arts Museum, are particularly rich in fine examples. The decorations for the Boston Library, for the Boston Fine Arts Museum, for the Harvard Memorial Chapel, absorbed him till, fortunate to the end, at 31 Tite Street, death overtook him in his sleep, in his 70th year, with no evident diminution of his forces, no weakening of his physical or mental energy.

Mr. Sargent had never married. He had been a devoted son and brother, and was survived by his two sisters, Miss Emily Sargent and Mrs. Francis Ormond. His body was interred at Brookwood Cemetery. Memorial services were held at Westminster Abbey, at the request of the Royal Academy and a replica in bronze of the Crucifixion in the Boston Library, with a memorial tablet, is to be placed in the Crypt of St. Paul's Cathedral.

In looking back over his immense achievement in so many different fields of art, his extraordinary vitality strikes one first. His slightest sketch pulsates with life. The beautiful suavity of his style he acquired through the iron discipline of years. He would paint a head 20 times over in order to give it the look of perfect ease and fluency he aimed at. He kept his palette and his brushes as carefully clean as a soldier keeps his weapons. At his easel he had the calmness of intense concentration. His brush would pause in mid-air and descend in a stroke calculated to a nicety. The knowledge of a lifetime was behind it. His insight into character was instinctive; character wherever it was exhibited—in the cut of a coat, in the detail of a building, in a dog, in the hands of a woman, in the head of a philosopher. This went far beyond ordinary perception; at its best it became a miracle of intuition, of skill in rendition. He knew no greater joy in life than this concentration on work provided him. What he lacked entirely may be called, for want of a better term, the feminine touch. Beauty and charm that were not in direct relation to his subject he could not entertain. This severity was his strength, as it was the weakness of so much of the art of the period that it perpetuated the worship of purely irrelevant sweetness. Idealisation, he felt, must come of itself with the enriching processes of time, when the years, helped by the imagination, give that nobility that is partly aloofness, partly an inherent quality in all great painting.

Taken as a whole, his portraits may come to be considered an epitome of the period in which he painted, not divested of those characteristics that make the human panorama so diverting, but bearing, with their unflinching realism, the very stamp of truth. Compared with these powerful representations, drawn from every class of modern society, the living people who pass before them seem shadowy and ill-defined. It is certainly to him above all that the age he lived in owes an appearance of stateliness and splendour, which was evidently as much a part of his own vision of life as the grace and elegance he could lend to the portraits of women—clothed with all the eccentricities peculiar to the late Victorian era—or the beauty that flamed for him wherever light played: on the rushing waters of a mountain stream, on heavily laden oxen, on a palace courtyard, or the interior of a stable. The exact measure of his greatness may safely be left to the future to determine.

(J. HE.)

**SARRAIL, MAURICE PAUL EMMANUEL** (1856– ), French soldier, was born at Carcassonne (Aude) April 6 1856. He passed out from the St. Cyr Military Academy in 1877, and after a series of promotions was appointed in 1907 director of infantry at the War Office. In 1911 he was promoted general of division and on Nov. 1 1913 was given command of the VIII. Army Corps, being later (April 24 1914) transferred to the VI. Corps which he commanded on the outbreak of the World War. On Sept. 2 1914 after leading the VI. Corps with credit at the battle of the Frontiers, he succeeded Ruffey as commander of the III. Army which played a brilliant part during the retreat to the Marne. During the trench-warfare operations of 1914–5 he was less successful, however, and he was transferred to the chief command of the French Army of the East. He later became commander-in-chief of the Allied forces on that front (see SALONIKA CAMPAIGNS). After the World War he devoted himself to politics and having stood unsuccessfully as Radical deputy for Paris, he was, in Jan. 1925 appointed high commissioner in Syria. In this capacity he showed undue favour towards certain of the native elements and a rebellion broke out among the Jebel Druses during which Sarrail bombarded the native quarter of Damascus. These events

caused a bad impression in France and a section of the press began to clamour for Sarraill's recall. In Oct. 1925 as a result of the report by General Dupont who had been deputed by the Government to inquire into the matter, he was relieved of his post.

**SASKATCHEWAN** (see 24.225), a province of the Dominion of Canada. Area 251,700 sq. m. of which 8,319 sq. m. are water. In 1921 the population numbered 757,510, an increase of 53.83 % over 1911. The rural population amounted to 538,552; the urban to 218,958. The principal groups were English 206,472; Scotch, 104,678; Irish, 84,786; German, 68,202; Scandinavian, 58,382; Russian, 45,343; French, 42,152; Austrian, 39,738; Ukrainian, 28,097; Dutch, 16,639; and Indians, 12,914. The capital city, Regina, had a population in 1921 of 34,432. Saskatoon is the seat of the provincial university. Moosejaw is an important railway and milling centre. Prince Albert is well-known for lumber and fur trading.

The province is governed by a legislative assembly, consisting of 63 members, with an executive council of seven members. It is represented in the federal parliament by 21 members in the House of Commons and 6 senators. The educational system has been carefully developed by the provincial Government, and includes elementary and high schools, two normal schools and a provincial university.

**Production and Industry.**—The province is essentially agricultural. Grain growing in the prairie sections and mixed farming in the prairie and woodland parts are carried on with conspicuous success. The transcontinental railway lines have a network of branches which serve the agricultural districts. The farmers are strongly organised co-operatively for the marketing of their products.

The following table gives the yield in thousands of bushels and value in thousands of dollars of the principal field crops for 1922-5:—

| Crop           | 1922               |         | 1923               |         | 1924               |         | 1925               |         |
|----------------|--------------------|---------|--------------------|---------|--------------------|---------|--------------------|---------|
|                | Yield              | Value   | Yield              | Value   | Yield              | Value   | Yield              | Value   |
| Spring Wheat   | 250,167            | 212,642 | 271,662            | 176,554 | 132,918            | 160,831 | 240,551            | 264,606 |
| Oats           | 179,708            | 52,115  | 218,075            | 54,519  | 97,345             | 41,858  | 174,967            | 57,739  |
| Barley         | 18,551             | 6,972   | 19,278             | 6,747   | 17,360             | 10,937  | 27,061             | 12,177  |
| Rye            | 16,164             | 8,567   | 8,582              | 3,861   | 2,507              | 2,382   | 4,512              | 2,888   |
| Flaxseed       | 4,079              | 6,975   | 5,494              | 9,614   | 6,119              | 11,932  | 7,439              | 14,580  |
| Potatoes       | 4,021 <sup>1</sup> | 3,210   | 4,370 <sup>1</sup> | 3,632   | 2,137 <sup>1</sup> | 3,291   | 3,623 <sup>1</sup> | 3,949   |
| Hay and Clover | 360 <sup>2</sup>   | 2,883   | 425 <sup>2</sup>   | 3,423   | 405 <sup>2</sup>   | 3,528   | 635 <sup>2</sup>   | 5,080   |
| Fodder Corn    | 187 <sup>2</sup>   | 1,309   | 305 <sup>2</sup>   | 1,600   | 277 <sup>2</sup>   | 1,640   | 260 <sup>2</sup>   | 1,560   |

<sup>1</sup> Cwts.    <sup>2</sup> Tons.

Livestock in 1924 included 1,170,745 horses, 468,151 milch cows, 1,060,716 other cattle, 123,362 sheep and 872,819 swine. Poultry farming is increasing in importance. Rapid and substantial progress has been made in dairying, the province being well suited for milch cows and stock of all kinds. The values of dairy products increased from \$6,051,000 in 1918 to \$19,357,329 in 1924; the output of creamery butter increased from 1,548,606 lb. in 1910 to 13,583,902 lb. in 1924; in the same year 19,250,000 lb. of farm-made butter was produced. The output of factory cheese increased from 26,730 lb. to 165,000 lb. in the same period. There were 64 creameries in operation in 1924, 28 of which were equipped with mechanical refrigeration.

Manufacturing industries are not important, the chief development being in flour milling and lumbering. The conditions are favourable to the production of non-metallic minerals. Lignites are mined in the southern part of the province. Ordinary brick clays are widely utilised and there are extensive beds of clays used in the manufacture of fire brick, stoneware, pottery and sewerage pipe. Water power resources are being actively developed: in 1924 the available 24-hour H.P. at 80% efficiency, at the ordinary six months flow, was 1,030,634. The railway interests are looked after by a provincial department of railways. In 1924 there were 6,956 m. of track in the province. Highways on March 31 1924 included 124,613 m. of unimproved earth, 10,387 m. of improved earth, 10 m. of gravel and 25 m. of bituminous concrete. The number of motor-cars is increasing, 70,561 being registered in 1924. (D. A. MACG.)

**SAVAGE, MINOT JUDSON** (1841-1918), American divine and author (see 24.239), died in Boston, Mass., May 22 1918.

**SAVINGS MOVEMENT.**—Professor Alfred Marshall in his *Principles of Economics* says that "man's character has been moulded by his every-day work, and the material resources which he thereby procures, more than by any other influence unless it be that of his religious ideals; and the two great forming agencies of the world's history have been the religious and the economic." The National Savings Movement is a definite and well thought out attempt to apply the economic forming agency to the improvement of the social conditions of the people of this country. The movement has two functions; the first is the education of all classes in the knowledge and practice of using wealth for the promotion of welfare. The second is to provide facilities for saving by the small investor on advantageous terms.

#### I. GREAT BRITAIN

**Origin.**—The movement in Great Britain was established in Feb. 1916 on the recommendation of the committee on War loans for the small investor, presided over by Mr. E. S. Montagu. It was recognised during the War that the fighting forces required all, and more than all, the available material and labour for the conduct of the War, and that non-combatants ought to restrict their demands to as great an extent as possible in order that everything required for war might be supplied. The economic doctrine of "goods and services" was developed and popularised, and many people came to realise more fully than before the great extent to which national well being depends upon the way in which individual citizens spend their money.

A more attractive motive for saving than has usually been presented, was put forward. Saving is a process which may be good or bad according to the purpose to which savings are applied. It is beneficial to the individual and to the community

when saving results in more but wiser spending. That more spending can result from saving is obvious from the fact that if £10 a year is saved for 17½ years, and interest is accumulated at 4% per annum, the capital will be sufficient to yield at the same rate of interest £10 a year in perpetuity. While the money is being saved and interest earned by it, the money directly or indirectly finds its way into industry, helps to develop the business of the country and in particular to increase employment. Truths of this character were more readily appreciated during the War than in normal times, and this prepared the way for the better understanding of the economic doctrine of "goods and services" as applied to peace conditions.

**Organisation.**—Early in 1916, on the recommendation of the Montagu Committee, two committees were established, one to undertake organisation, and the other to advise about matters of finance. After a few months the two were merged into one under the title of the National War Savings Committee. This was concerned with England and Wales, and shortly afterwards a separate committee was appointed for Scotland. Corresponding work in Ireland was subsequently undertaken. The method of organisation is interesting and has proved effective. Local committees were established in most towns and country districts; their task was to educate public opinion and to establish savings associations which should receive subscriptions for savings certificates among groups of people who are associated for other purposes, such as children in schools, employees in business firms and members of clubs. The members of the local committees

and the officials of the Savings Associations are all voluntary and unpaid workers, but there is a small paid staff, the expenses of which are met by a Parliamentary grant. The organisation has been well described as a "voluntary movement that is also a government department." Every effort has been made to give the fullest expression to the views of the voluntary workers. The associations are represented on the local savings committees, and each savings committee nominates two members to attend an annual Regional Conference. Formerly there was a Conference for almost each county in England and Wales, but after a time the territory was divided into twelve regional areas, in each of which a large and important conference is held every year.

The original Savings Committee consisted only of nominated members who represented certain interests, or whose services were valuable on personal grounds. Among the interests now represented on the National Committee are the Post Office, the Board of Education, the National Union of Teachers, the joint stock banks, the trustee savings banks, the Ministry of Health and the Municipal treasurers. It was thought desirable that other members of the committee should be elected by the voluntary workers. To achieve this each annual conference elected representatives to serve on a national savings assembly, which normally meets annually, and which at its outset elected six representatives to serve on the National Committee. This representation was so successful that the number of elected representatives was increased to twelve, and on the division of the country into twelve regions, one representative is nominated at each of the twelve regional conferences. These elected representatives contribute to the management of the Movement the result of their personal experience in their respective areas, and to this is largely due the flexibility and initiative that is usually more characteristic of a voluntary movement than of a government department.

*War Savings Certificates.*—In order to make better provision than previously existed for saving by the small investor, the "War savings certificate" was introduced in Feb. 1916. It originally cost 15s. 6d. and accumulated to £1 by the end of five years. The life of the certificate was subsequently extended to ten years, when it became worth 26 shillings. So far as savings certificates are concerned, income tax does not exist, the interest upon them not being taxed, and not having to be included in returns for either income tax or super tax. The certificates can be cashed at a day or two's notice for their cost price, plus the accrued interest. The ingenious plan is adopted of allowing a rate of interest that, speaking generally, increases with the length of time which the certificate is allowed to remain before being cashed. The first series of certificates yielded just under 5½% if cashed at the end of five years, and a trifle over this rate if allowed to remain for ten years. The second series of certificates was commenced in April 1922. The purchase price was raised to 16s., but the general conditions were almost identical with those of the first issue. With a further fall in the prevailing rates of interest a third issue was commenced in Oct. 1923; the purchase price remained at 16s. and the value at the end of ten years is 24 shillings.

Important characteristics of savings certificates are that they can be cashed at any time without loss of capital; that the interest accumulates instead of being paid in dividends; that they are entirely exempt from income tax and super tax; that the rate of interest, especially if held for the full ten years, is high; that they can be purchased by instalments, and that they are registered securities which can safely be kept by those who have no accommodation for the custody of valuables. These attractive features immediately won recognition. By April 1925 more than 764,000,000 certificates had been sold, representing a cash investment of nearly £600,000,000, of which, after deducting withdrawals, more than £372,000,000 remained invested, in addition to the accrued interest. In the financial year ending April 1926, the sales exceeded by about 10% those of the previous year, and the amount paid for withdrawals was substantially less though the total amount remaining invested had increased.

*The Movement in Peace Time.*—During the War the purchasers of certificates knew that they were lending their money to the Government to help pay for the War. When peace came, it was thought advisable that the money might still be earmarked for some national purpose. It was therefore decided that half the money paid for savings certificates in any area could be borrowed by the local authority of that area for capital expenditure on housing. The purposes to which loans could be applied was subsequently extended, and up to April 1926 loans had been made to nearly five hundred local authorities.

The use of savings certificate money for War purposes became so predominant that many people failed to realise, when peace came, the great advantages that would still accrue to individuals and to the community by the continuance of savings associations, and in consequence many of these came to an end. It took some years to make generally understood the great advantages of the movement to individuals and to the community. This is now being accomplished with increasing success, and in 1926 more than four hundred new savings associations are being formed every month. One contributing cause of this success is that extremely simple schemes for the purchase of savings certificates by instalments have been devised which involve practically no time or trouble for account keeping. Special savings stamps costing six pence each are used under one scheme, and six penny coupons under another. These stamps and coupons are stuck on cards which, when they contain thirty-two coupons or stamps, can be exchanged for a Certificate. There are other schemes admirably suited for different circumstances, which also reduce the work to a minimum.

*Saving in the Schools.*—From the outset the work has been most successfully and extensively undertaken by the schools. The Board of Education, the local education authorities, the National Union of Teachers, inspectors and directors of education and the schoolmasters and schoolmistresses throughout the country, have rendered a service to the country in this connection that cannot be valued too much or praised too highly. In April 1926 there were more than thirteen thousand school savings associations in existence.

The National Committee were confronted with the somewhat difficult problem of seeing that the work done in the schools and the habits there formed, were not lost when the children left school. For this and other reasons, it became important to establish savings associations in as many works, shops and offices as possible. The importance and social value of the work was at first inadequately recognised, but in 1926 savings associations among industrial groups are being formed at the rate of over two hundred a month. Employers can render no better service either to their employees, to the community or to the prosperity of the industry of the country than by encouraging the formation of savings associations among their employees.

In Feb. 1926 the earliest issued certificates reached maturity at the end of ten years from the date of issue, and a committee under the chairmanship of Mr. Cecil Lubbock was appointed to consider what steps should be taken in view of the approaching expiry of the term for which the certificates were issued. The committee recommended that an option should be given to all holders of first series certificates to continue to hold them until March 1932, receiving interest after the tenth year at the rate of one penny per certificate per month. This recommendation has already been adopted. The committee further recommended the issue, for the conversion of savings certificates of the first series, of a special savings bond designed to meet the needs of the small investor, and of the new 4½% conversion loan; the encouragement of early conversion of savings certificates of the first series by the grant of a small bonus on certificates converted before they have run ten years; and finally that conversion of certificates should be made possible without the necessity of encashment and reinvestment.

In order to avoid undue loss of income tax, the purchase of certificates by any one individual is limited to five hundred, and five hundred certificates of the first series have at the end of ten years a cash value of £650, whereas five hundred certificates of

the third series would cost only £400. Hence some fresh security was deemed advisable. Doubtless the holders of comparatively small numbers of maturing certificates will convert them into certificates of the current series, while other holders may decide to have the value of the maturing certificates placed to their credit in the Post Office Savings Bank. (R. M. K.)

#### THE PUBLICITY CAMPAIGN

Prior to the outbreak of War in 1914, Government loans in Great Britain were subscribed by a very limited circle of large investors, businesses and corporations. Publicity in connection with the floating of them began and ended with the issuing of a prospectus, its publication in the Press and its distribution by a limited number of bankers and stockbrokers.

*Initial Operations.*—The first attempts at the application of modern methods of publicity to the flotation of War Loans were on a limited scale, being hampered by official reluctance to depart from traditional procedure and a prejudice against any lapse from official "dignity." A slight expansion of newspaper advertising, at first not widely departing from mere "publication of prospectus" advertising, and the use of posters displayed in the streets and on hoardings, marked the beginning of a new state of things. The work of the War Savings Committee from 1916 onwards, together with news of the successful publicity work in the U.S., helped to reconcile British officialism to an increase of activity in this direction. By the time the so-called "Victory" Loan was floated, early in 1917, newspaper advertising had increased both in volume and effectiveness. Many more posters appeared on the hoardings. The services of local authorities were invoked, and public meetings were held, up and down the country, at which speakers drew attention to the country's pressing need of money and appealed openly for subscriptions. It was, however, in connection with the campaign for National War Bonds, which were first offered to the public in Sept. 1917, that organised publicity on behalf of British War Loan subscriptions displayed the fullest measure of its possibilities and achieved its greatest success. The National War Bonds were short-dated securities continuously on offer—in contrast to earlier loans the subscription lists for which had remained open only for some weeks. They were introduced by Mr. Bonar Law, the then Chancellor of the Exchequer, in order to inaugurate a period of "continuous borrowing"—to provide a method by which the public could subscribe each week the weekly cost, or more than the weekly cost, of the War. It was hoped by this means to avoid the dislocation of the money market and the inflation of currency.

Despite attractive terms the subscriptions for National War Bonds for the first two or three weeks were distinctly disappointing. Starting at an exceedingly low weekly total the receipts rapidly fell, and it says much for the extent to which publicity methods had already justified themselves that in Nov. 1917 the Chancellor of the Exchequer, faced with the prospect of the failure of the whole new scheme of continuous borrowing, saw fit to appoint Sir George (then Mr.) Sutton, the chairman of the Amalgamated Press Ltd., as Director of Publicity for the War Bond Campaign—with a free hand as to methods employed, and, within very wide limits, a free hand as to expenditure.

*Value of Advertising.*—The backbone of the campaigns was undoubtedly newspaper and periodical advertising. This advertising was practically continuous, though very widely varied. The appeal of it was cast and recast in a hundred ways. It struck first the finance note, the self-interest note, the explanatory "see what you get and what security" note and then the loftier note of patriotism, of service, of exhortation to duty. The advertising was intensely human, written to appeal not merely to business men but to the people at large. It reached its highest pitch of emotional appeal during the terrible spring of 1918 when the Germans, pushing far into the Allied lines, threatened Amiens, and the whole British nation hung breathless upon the march of events. During those dark weeks the War Bond advertising told, almost day by day, the story of England in terms of Belgium; pointing out the inevitable and hideous consequences of

defeat, and urging the duty of supporting with money the brave men then fighting. Appropriate "copy" was actually kept standing for immediate publication in the event of certain contingencies such as a great victory, or (on the other side of the picture) the air bombing of important British towns.

It was recognised that in order to sustain interest in War Bonds over a long period the steady appeal of the press advertising required reinforcing by periods of special activity. The necessary stimulus was obtained by the organisation throughout the country of special "weeks" such as "Tank Weeks"—"Business Men's Weeks"—"War Weapons Week"—"Feed the Guns Weeks." The main features of these were similar. They consisted essentially in the provision of some spectacular feature round which the appeal for subscriptions could centre. Tanks, for instance (then just newly invented), each with an officer and crew, took up their stand for a week at a time in the leading towns and cities. Officials of the Bank of England and of the Post Office accompanied the tanks, and many million pounds' worth of bonds were sold by them.

*Forms of Appeal.*—All these separate campaigns of special weeks were "led off" by spectacular displays in Trafalgar Square, London, which was transformed for each occasion into something resembling a huge circus. Tanks or guns, as the case might be, were "parked" and surrounded with skilfully built imitation trenches and entanglements; barriers and huts were erected, painted scenery was provided to form a background, giant posters almost hid the façades of the National Gallery and the buildings surrounding the Square, and hundreds of thousands of people were attracted of a class which could probably not have been reached by any other form of appeal. Carrier pigeons were also used, with great success from the point of view of publicity, to bring in applications from a distance to Trafalgar Square. Another important publicity aspect of these special weeks was the opportunity each provided for an important official opening. Thus "Business Men's Week" was preceded by a great public meeting in the Connaught Rooms, London, at which the Chancellor of the Exchequer was the chief speaker and to which all the leading bankers of the kingdom were invited. "Feed the Guns Weeks" were introduced by another great meeting at the Guildhall, addressed by the Chancellor of the Exchequer and the Rt.-Hon. A. J. Balfour. The extent of the response to these special weeks was enormous, as may be judged by one of them only, the "Business Men's Week," which brought in £160,000,000—nearly eight times as much as the average weekly total.

Apart, however, from greatly increased purchases, these special weeks, "booms" and "stunts" were very valuable as yielding a continuous "news" story. The problem before the publicity director was to maintain interest in War Bonds week after week and month after month; and had the campaign once been allowed to become a matter of routine, lacking new incidents, the "news" story of it would perforce have dropped out of the columns of the press. As it was, so great was the variety and so many the incidents that a full-size news agency had to be installed at headquarters, where a large staff was kept busily engaged in collecting news by telegram and telephone from all over the country and passing it on to the press. A successful publicity device was the inter-town War Bond race. The race, of course, was to secure the largest total of local holdings in War Bonds, and, promoted and fostered by the Publicity Director, it went gaily on for months—the varying position of the leading cities, now one leading, now another, forming for over a year an almost staple article of news.

*Varied Devices.*—Many other publicity devices were employed, among which the following may be noted:—

(1) Arranging with the Postmaster-General to adopt a cancellation mark carrying the words "Buy War Bonds," so that practically every citizen received a daily reminder of his duty on the envelope of every letter received. (2) A letter signed by the Chancellor of the Exchequer urging investment as a patriotic duty—sent out by the Bank of England with each dividend on a Government security. (3) A letter signed by the chairmen of banks to the individual depositors urging that deposits should

be reduced and the money invested in War Bonds. (4) A letter sent out by limited liability companies simultaneously with the dispatch of their dividend warrants, urging that the amount of the dividend should be at once invested in War Bonds.

After the Armistice a closing date for War Bonds was announced, and a very extensive final appeal was organised which brought the total of investment in them up to the magnificent figure of £1,600,000,000—subscribed in under 17 months. Publicity in connection with post-Armistice loans, notably the Thanksgiving Loan of 1919, was conducted on similar lines.

(G. A. S.)

## II. THE UNITED STATES

In the United States the term Savings Movement was used in a somewhat wider sense than was the case in Great Britain. The publicity campaign carried on in Great Britain found its counterpart in the one conducted in the United States on behalf of the Liberty Loans (*see* LIBERTY LOANS).

Upon the declaration of War by the United States in April 1917 it became evident that the nation must practise strict economy if the huge War-time expenditures were to be successfully financed and material aid given to the Allies. President Wilson outlined a food control programme, after the U.S. declaration of War in April 1917, appointing Herbert Hoover Food Administrator. Congress passed the Lever Act (effective Aug. 10 1917) designed to encourage the production and conservation of supply and to control the distribution of food products and fuel. The administration of the Act was under the direction of a U.S. Food Administrator and a U.S. Fuel Administrator. The ends sought by the Food Administration were: (1) to save food and eliminate waste; (2) to distribute food equitably and cheaply; (3) to stimulate production; (4) to prevent hoarding; (5) to save transportation; (6) to provide for the needs of the U.S. Army and Navy; (7) to secure the largest possible amount of food for the Allies.

*Sugar and Wheat.*—The most vital early need both for America and for the Allies was the conservation of sugar and wheat. In Aug. 1917 an International Sugar Committee was appointed. It was faced by a scarcity of sugar that had sent the price of Cuban raw sugar to \$0.15; this was fixed at \$6.90 for the season's crop, the retail price being kept at 8½ to 10 cents per pound. From May 15 1918 the sale of sugar for manufacturing purposes was prohibited except through special permits (certificates) by which records of consumption could be kept. Retailers were restricted from selling sugar to consumers in quantities greater than 2 lb. for city residents and 5 lb. for those residing in the country, except for home canning, in which cases the dealer was required to secure certificates for the amount sold. By such means a saving of between 400,000 and 600,000 tons was effected in 1918.

The wheat shortage of the season 1917-8 left the United States with only enough of this grain to meet normal demands for home consumption. The total production of France and Great Britain was considerably less than one-third their normal consumption, and it was essential that they should receive from the United States an additional 75,000,000 bushels. All manufacturers in the United States using wheat flour in the production of various foods were placed under licence and their supply was strictly limited. Wheatless days and other measures for wheat conservation were established. Mills were permitted to grind only a certain percentage of the amount of wheat milled during a corresponding period the previous year. Wholesale dealers were prohibited from purchasing wheat flour in excess of 70% of the amount they had purchased during a corresponding period the previous year. In sales to consumers the retailers were required to sell an equal quantity of substitutes to the purchaser at the time wheat flour was sold. Between 13,000,000 and 14,000,000 women pledged themselves to the conservation of wheat by the use of substitutes for wheat products. These various measures made it possible for the United States to send abroad in 1918 approximately 140,000,000 bu. of wheat.

Export of fats to neutrals was greatly restricted and the amount of fats used in bakery products limited. In 1918, 1,125,397

short tons of hog products were exported as against 830,000 in the fiscal year ending June 30 1899, the largest in any year prior to 1918. In 1918, 773,000,000 lb. of beef were exported, or over three and a half times the exports on the average of the three previous War years. These supplies were made available by the conservation of meats formerly wasted, by voluntary rationing and by the adoption in many localities of meatless days and meatless meals.

To remedy the congestion of rail terminals and keep open the transportation routes, a regulation was promulgated providing an average increase in the minimum car-loads of about 50% over those of the published tariffs of the carriers. Thus the number of cars required for the distribution of the commodities on the list of non-perishable groceries was reduced fully 25%. The Waste Reclamation Service was instrumental in reclaiming during 1918 waste material valued at approximately \$1,500,000,000. The National Emergency Food Garden Corporation put 1,500,000 ac. of city and town land under cultivation in 3,000,000 gardens, resulting in an increase of the food supply to the value of over \$350,000,000 in one year.

*Fuel Administration.*—The U.S. Fuel Administration began its work in Aug. 1917, with Dr. Harry A. Garfield as director. The Administration set out to accomplish: (1) increased production; (2) better distribution; (3) fair sale prices; (4) the elimination of waste. It succeeded largely, through agreements, in preventing strikes, with their resulting interruption of production. In April 1918 a nation-wide plan designed to insure equitable distribution of coal was put into effect. More than 5,000,000 tons formerly shipped from eastern mines to western territory adjacent to western mines were saved for the eastern states, where the demand of War industries was greatest. Rationing was put into effect, the supply of coal to non-essential industries being greatly reduced. It was estimated that this saved over 1,000,000 tons. All industries were held to their minimum needs. Stores and office buildings were encouraged to take their electric current from central plants. A "skip-stop" system was adopted on electric street railways by which no stops were made at unimportant crossings. Economy was also effected by "lightless nights," which affected window lighting, electric display and street illumination. Home instruction was given in the operation of heating systems and in the use of electricity. For several weeks heatless Mondays were observed in stores, office buildings and places of amusement. A saving of 12,700,000 tons of coal for the first half of the coal year was thus effected in addition to large economies made possible by "daylight saving" (*q.v.*). From so-called gasoline-less Sundays, involving a voluntary cessation of Sunday motoring, resulted an estimated saving of 1,000,000 bar. of gasoline.

The Conservation Division of the War Industries Board was established May 9 1918. Its purpose was to eliminate wasteful or unessential uses of labour, material, equipment and capital. Its specific aims were: (1) to secure the maximum reduction in the number of varieties of products of the various industries; (2) to eliminate accessories which used material for adornment or convenience, but which were not essential; (3) to substitute materials which were plentiful for those which were scarce; (4) standardisation; (5) reduction of waste; (6) economy in samples; (7) economy in containers and packing. By such means enormous savings were effected in textiles, paper and other materials, as well as in storage space and labour. Reductions in varieties of particular commodities held out such promise of permanent economies that this activity was later continued through a Division of Simplified Practice in the Dept. of Commerce (*see* STANDARDISATION).

The request that the people of the United States lend money to the Government to provide necessary funds for the prosecution of the World War met with an almost universal response. Over 22,000,000 people purchased Liberty Bonds and Victory Notes in various denominations from \$50 to \$10,000, and other millions invested in the smaller war savings securities.

*War Savings Certificates and Thrift Stamps.*—Section 6 of the Second Liberty Bond Act, approved Sept. 24 1917, authorised

the Secretary of the Treasury to issue war savings certificates, redeemable within a maximum term of five years from the date of issue, on which interest to maturity might be discounted in advance. A limitation of \$2,000,000,000 (later \$4,000,000,000) was placed by the Act upon the amount of war savings certificates which might be outstanding at any one time; a limit (later withdrawn) of \$100 was placed on the amount of certificates which might be purchased by one person at one time; and no individual was permitted to hold more than \$1,000 in such certificates (later \$1,000 in a single issue). Four series of war savings certificates were issued—on Dec. 3 1917 (series of 1918); Jan. 1 1919; Jan. 1 1920; and Jan. 1 1921. Each certificate, in the form of a stamp, when affixed to a war savings certificate (a folder with spaces for 20 stamps) would have a fixed maturity value of \$5, with the date of maturity not to exceed five years, the purchase price to vary one cent each month throughout the year of issue, beginning in Jan. at \$4.12 and increasing to \$4.23 in December. The stamps might be redeemed before maturity, their redemption value increasing one cent each month. There were also provided 25-cent "thrift stamps," bearing no interest and not redeemable for cash, but to be accumulated on a "thrift card" until there were 16, when they could be exchanged for a war savings certificate stamp by paying the additional odd cents necessary to cover the current price of the war savings certificate stamp.

In addition to the original securities there were offered in July 1919, Treasury savings certificates, one of \$100 and the other of \$1,000 maturity value. Treasury savings certificates were registered at the Treasury Dept. at the time of purchase and increased in redemption value monthly on the same interest basis as War savings certificate stamps. In Jan. 1921 there were offered for sale \$1 non-interest-bearing Treasury savings stamps and \$25 Treasury savings certificates, in addition to the other Treasury savings securities.

*Organisation.*—The sale of these securities was furthered by a National War Savings Committee, assisted by six Federal and 52 state directors. The ultimate goal was to offer every man, woman and child in the United States the privilege of aiding the Government by investing in government securities, and at the same time to develop habits of thrift. The war savings securities were put on sale at every post-office, at banks and in thousands of voluntary agencies. House-to-house canvass for their sale was made by postmen, boy scouts, representatives of insurance companies and members of women's organisations. Sales from Dec. 3 1917 to Jan. 1 1921 totalled \$1,176,111,000. Redemptions in the same period amounted to \$415,174,000.

Partly with a view to rendering permanent the habits of thrift imparted during the War, the War Loan organisation, through a savings division, took over, in the autumn of 1918, the work of the National War Savings Committee. It aimed to sell Treasury savings securities and to develop and protect all War issues of the Government. School Government savings systems were established and instruction in thrift, saving and the principles of sound finance was introduced into schools. (J. W. T.)

**SAXONY** (see 24.265).—A free state and territory (Freistaat Sachsen) of the German Reich. The area is 5,787 sq. m.; the population (1926) 4,970,300.

*Conflict Over the Constitution.*—In the years immediately preceding the World War political life in the German kingdom of Saxony was dominated by a conflict about the constitution. The Left had for years demanded a reform of the First Chamber, the Upper House, by which the predominance of the agrarians in that House should be broken, and commerce, industry and handicrafts should obtain greater influence. In Jan. 1910 the National Liberals, Liberals and Social Democrats once more introduced resolutions with this object in the Lower House, but these met with keen opposition from the Government. Notwithstanding the majority in the Lower House for the reform, it was thrown out by the Upper House. In Dec. 1917 the Government introduced a bill for the reform of the Upper House, which again led to fierce conflicts in Parliament, which only ended with the advent of the German Revolution. Simul-

taneously controversy concerning a new electoral law for the Lower House had been raging since 1910.

*War Conditions.*—Saxony, which is chiefly industrial, suffered more under War conditions than most other German States. The problems of supplying the population with food were extremely difficult. There was a widespread dearth of the most important foodstuffs, such as corn and potatoes, so that the population was frequently obliged to use substitutes.

*The Revolution.*—In 1917 the extreme Left in the Saxon Diet had begun an agitation, which never abated, for the early conclusion of peace. On Oct. 26 1918 the Cabinet gave place to a more liberal Government under Dr. Heinze. On Nov. 9 1918 the revolution broke out, on Nov. 10 the Republic was proclaimed, and King Frederick Augustus abdicated on Nov. 13. A Cabinet of Commissaries of the People (*Volksbeauftragte*), composed exclusively of Independent Socialists, was formed. Revolutionary conflicts in Jan. 1919, which entailed sanguinary street fighting in Leipzig, Dresden and elsewhere, led to the resignation of the Cabinet, which was succeeded by a Government of Majority Socialists. The extreme Left instituted demonstrations throughout the country, and there were serious excesses, especially in Plauen and Leipzig. In April 1919 a Soviet Republic was proclaimed in Leipzig, which was dissolved by troops of the Reichswehr under Gen. Märker on May 12. Serious disturbance followed in the Vogtland and in Chemnitz in June and August. On Oct. 2 1919 the Democratic party joined the Ministry, which kept in power till April 25 1920. It was replaced by a coalition of Majority and Independent Socialists, which was vigorously combated by the non-Socialist parties.

In the spring of 1920 formidable unrest recurred, especially in West Saxony. In Leipzig sanguinary fighting continued for several days. In the Vogtland the Communist Hölz formed a band of several hundred men, with which he conducted a reign of terror in the towns and villages. The Government long hesitated to take action against him; finally, however, Hölz's force was surrounded and dispersed by Reichswehr troops. Hölz fled to Czechoslovakia. In March 1921 he returned and took command of the Communist insurgents in Central Germany. After the collapse of the insurrection he fled to Berlin, where he was ultimately arrested, and condemned to penal servitude for life with the loss of civic rights (June 1921).

*The New Constitution.*—On Nov. 1 1920 the definitive new constitution was adopted unanimously by all parties. The supreme organ is the Diet (Landtag), consisting of one chamber. Its rights are only limited by those of the people, which can dissolve it, and themselves initiate legislation by means of a popular initiative (*Volksbegehren*) or give a referendum on measures passed by the Landtag. The Landtag elects the Minister President, who then nominates the rest of the Ministry, which, like himself, must enjoy the confidence of the Landtag. The Minister President also determines the general lines of the policy and the Ministry; his position entails real authority, but he is not the titular head of the State.

In 1923 the Zeigner Ministry, which was not able to control the Communist agitation, came into conflict with the Government of the Reich, which sent a Commission and troops to Saxony to restore order. Zeigner's Ministry was replaced by a Ministry composed of German People's Party Democrats and Social Democrats. Zeigner was prosecuted for corruption (see GERMANY). (W. v. B.)

**SAZONOV, SERGHEI DMITRIEVICH** (1866– ), Russian statesman, was born in the province of Ryazan July 29 1866. the son of a landed proprietor, and educated at the Alexandrovsky Lyceum, St. Petersburg (Leningrad), a high school for the sons of noblemen destined mainly for the civil service. Having occupied various diplomatic posts in Rome and served six years in the Russian Embassy in London he was promoted, in 1906, to be Minister-Resident at the Vatican, where his engaging manners, frankness and taste for ecclesiastical affairs enabled him to make great headway. In 1909 he entered the Ministry of Foreign Affairs as coadjutor to Izvolsky, and in 1910 succeeded the latter as Minister and thus became one of the international group of statesmen into whose hands chance rather than personal ambition or specific fitness placed the destinies of their respective countries. This appointment, ascribed to the influence

of his brother-in-law, the dictator Stolypin, was so agreeable to Nicholas II., whom Sazonov attracted by his great charm of manner, that when the Minister fell ill and seemed unlikely to recover, the Tsar steadfastly refused to name a successor.

Sazonov's line of action was definitely traced for him by the European situation on the one hand and by the limitation of his rôle to that of confidential secretary to the Emperor on the other. His chief functions were to parry Austria's fitful thrusts at Serbia, to curb Serbia's explosive impatience, buoying her up with hopes of a vast legacy to fall due on the death of the Emperor Francis Joseph, and to bespeak the help of England, Italy, Rumania and Bulgaria in the coming struggle. These tasks exceeded his powers, and his abortive Near-Eastern policy did not prevent Russia's ruinous collapse during the World War, a momentous event for her allies. Although the principal governments were making ready for the "unavoidable conflict" none was rash enough to provoke it deliberately, and only one was sufficiently purblind to fancy that a ruthless campaign against Serbia might be opened without bringing on a general struggle. In this delusion, harboured by the Austrian Minister, Count Berchtold, lurked the most redoubtable danger which Sazonov and Europe had to encounter. Berchtold strove to catch Serbia on the horns of the dilemma: friendship or enmity. Turkey, the oppressor of the Slavs, he argued, having been eliminated in the Balkan War, Serbia no longer had a motive for maintaining a standing army unless meant for use against Austria. If, therefore, a friend, she must disband her army and cultivate close amity with her powerful neighbour; and if an enemy, she could not complain of being dealt with as such—neither could her protectress, Russia. In this lay the crux of the situation.

This peril might perhaps have been exorcised had Germany insisted on having a say in Austria's Balkan plans. But dreading to forfeit the support of her "last sure ally" she eschewed all preliminary conditions and felt bound withal to uphold the most extravagant sallies of her Austrian partner. This obligation proved fatal at last owing to Berchtold's resolve at the close of the Balkan War to reduce Serbia to the status of a protectorate. By way of thwarting this design Sazonov frankly announced that any attempt to force upon the Slav kingdom terms incompatible with its sovereignty would compel Russia to make the quarrel her own. But neither in Austria nor in Germany was the Tsardom credited with military strength enough to enable it to carry out this threat.

Down to the 11th hour Sazonov, eager to gain time for Stolypin's far-reaching domestic reforms, worked for peace with a fervour which won general recognition but scant success. The arrangements come to during the Tsar's visit to Potsdam (Nov. 4-5 1910) and the Kaiser's return visit to Wolfsgarten (Nov. 11) respecting the Baghdad railway, North Persia and the maintenance of Turkey, eased the strain without dispelling the atmosphere of mistrust. Sazonov was suspected of a lack of a straightforwardness by the Kaiser. Russia's diplomatic representatives abroad were largely to blame for this, and in particular the rashness or awkwardness of ambassador Charykov in Constantinople who secretly proposed to guarantee that city to Turkey and protect her from all attacks by the Balkan States in return for the freedom of the Straits. Other covert moves also lent colour to the charges of underhand dealing. For example, Turkey's prostration during the conflict with Italy suggested to her enemies, the Balkan States, a defensive alliance under Russia's patronage; and this was secretly arranged first (March 13 1912) between Serbia and Bulgaria and then (May 29) between Bulgaria and Greece.

But the difficulty of limiting the alliance to legitimate defence and the imminence of a Balkan War became forthwith so obvious that Russia alone felt incapable of dealing with the situation. Sazonov decided to seek Germany's help in overawing the Balkan States without disclosing to her the secret cause of their combative mood. He accordingly arranged an interview between the Tsar and the Kaiser at Baltischport on July 4-5 1912, which was followed by a three days' exchange of views between the German Chancellor and the members of the Russian Govt. in St. Peters-

burg. On this occasion Sazonov's advocacy of close co-operation between Germany and Russia was approved by Bethmann Hollweg, but doubts were again awakened concerning the Russian minister's straightforwardness owing to his concealment from Germany of the existence of the Balkan Alliance. Sazonov next repaired to London, Paris and Berlin and the Great Powers authorised him and Berchtold to announce their determination to uphold the *status quo*, so that if the Balkan States broke the peace their victory would be fruitless. But this, like most vetoes of the Powers, was ignored by the restive kingdoms and the sequel justified their disregard. By Nov. Europe was on the verge of a general war. During the crisis the Kaiser oscillated from one extreme to another; Archduke Franz Ferdinand gave proof of surprisingly sound views and Sir Edward Grey successfully discouraged the would-be belligerents. Sazonov, keeping a tight hand on Serbia, obliged her to content herself with a railway harbour on the Albanian coast, a railway connection and the secret assurance that her "promised land" lay within the dual monarchy.

Turkey's future now became one of the main cares of the Great Powers, and Sazonov, in collaboration with Bethmann Hollweg, drafted a liberal scheme of reforms for Armenia (Nov. 5 1913). Immediately afterwards Germany sent military instructors to reorganise the Turkish army and a German General, Liman von Sanders, to wield extensive powers and virtually to garrison Constantinople. Sazonov endeavoured to move the Allies to get Liman recalled or transferred to Asia Minor, but Sir Edward Grey held that a reassuring statement by the Porte would answer all reasonable requirements. Sazonov, however, gave vent to his dissatisfaction in unusually strong terms, but on the Kaiser ordering Liman to lay down the command of the first Turkish army corps, while retaining his other functions, Nicholas II. let the matter drop. Sazonov then drafted a memorandum to the Tsar on Russia's claim to the freedom of the Straits (Nov. 1913) and three months later (Feb. 21 1914) convened a council of political and military experts to discuss the ways and means of realising the scheme in case of a European war. But the military experts announced that in the plans of campaign no such side-problems could be included.

The murder of Archduke Franz Ferdinand on June 28 1914 changed the political outlook radically and supplied Austria with an opening which she utilised to the fullest extent. Berchtold was for an immediate invasion of Serbia. Count Tisza was successful in his demand that an ultimatum should first be sent, but it was in vain that he opposed the terms of the document which were obviously intended to provoke rejection. After having lost much precious time Sazonov proposed modifications which Berchtold declined to accept. He fancied that by undertaking to abstain from annexing Serbian territory he could insure the Tsar's neutrality. Russia meanwhile adopted the military measures known as "pre-mobilisation" (July 25) and the plan of a merely partial mobilisation to follow was entertained by the Tsar and Sazonov in case Serbia should be attacked. But the General Staff objected that it had no plan ready for a transition from partial to general mobilisation, and that as war seemed unavoidable the latter was imperative. Sazonov, however, still insisted on waiting. Meanwhile, Berchtold declared war against Serbia despite her acceptance of most of the humiliating conditions of the ultimatum (July 28), whereupon Sazonov's views underwent a complete change and (in the night of July 28-29) Nicholas signed the fatal edict. A belated telegram, however, from the Kaiser adjuring him to preserve peace for the sake of the monarchic principle moved the Tsar to withdraw the order for general, and substitute that for partial, mobilisation. This command was obeyed in words but the military experts having convinced Sazonov that it would be suicidal, the Minister next morning (July 30) presented himself to the Tsar and obtained his consent to the radical measure advocated by the General Staff. On the following morning this order was posted up in St. Petersburg and the catastrophe broke loose.

During the War Sazonov countered all influences tending to the abandonment of the struggle by Russia but he followed the

Tsar's lead in demanding first the opening of the Straits and the internationalisation of Constantinople and later on the annexation of the Turkish capital. The hostility of Turkey and Bulgaria deprived Russia of aid from the Allies, whereupon Sazonov made a bid for the help of the Poles in the shape of a Home Rule scheme, but the proposal was scouted in Court circles and he was dismissed from his post. Thus ended his career. His fall was gently broken by his appointment as Ambassador to Great Britain, but before he reached his destination the revolution of March 1917 had deposed the Tsar. Sazonov, however, was willing to represent the Government that had thrust aside his imperial master but it too was suddenly swept away. He was next appointed Minister for Foreign Affairs by Admiral Kolchak but played no further part in the destinies of his country.

(E. J. Di.)

**SCALDS:** see BURNS and SCALDS.

**SCAPA FLOW**, an expanse of sea, in the south of the Orkneys, bounded by Pomona on the north, Burray and South Ronaldshay on the east and southeast, and Hoy on the west and southwest. The area contains seven small islands and is about 15 m. in length from north to south, and about 8 m. in mean breadth. There are two chief exits—one, 7 m. in length and 2 m. in mean breadth, into the Atlantic Ocean by Hoy Sound, and the other,  $3\frac{1}{2}$  m. in length by 2 m. in mean breadth, into the North Sea by Holm Sound.

Admiral Jellicoe chose Scapa Flow in preference to the Cromarty Firth as his chief naval base, but in Aug. 1914 no preparations had been made and everything had to be improvised, guns being landed from the ships to strengthen the defences. By the middle of Oct. 1914 "U" boats were active in the neighbourhood, and on Oct. 16 an enemy submarine was reported to be in the Flow. It was recognised that the base would be unsafe until anti-submarine defences were installed, and by the end of 1914 the entrances had been adequately protected, facilities for carrying out all but the most serious repairs were installed, and Scapa Flow gradually assumed the aspect of a great naval station, which it retained to the end of the War. As a precaution against espionage, navigation in the adjacent waters was very severely regulated, and an everwidening region of the mainland (ultimately extending as far south as the Caledonian Canal) was proclaimed as a prohibited area. The German ships which were surrendered in Nov. 1918 were interned in Scapa Flow, where on June 21 1919 all the battleships and battle cruisers, with the exception of the battleship "Baden" and five light cruisers, were scuttled. Three light cruisers and some smaller vessels were beached.

**SCARBOROUGH**, England (see 24.301), had an area of 2,727 ac. (increased from 2,562 ac. in 1913) and a population of 46,179 in 1921. The town was bombarded by German cruisers in 1914 and by submarines in 1917. The castle (since repaired), the lighthouse, two churches and many other buildings in the town were damaged. The residential districts on the north and south cliffs have increased considerably, and large sums have been spent on buying and laying out the undercliff in the north and south bays, on a park with an artificial lake and on acquiring open spaces. The Floral Hall in Alexandra Gardens was opened in 1910; Londesborough Lodge has been purchased by the corporation to house the trophies given by Colonel Harrison; and the People's Palace, used as a store during the War, and subsequently closed, has also been acquired. The remains of a Roman signalling station, excavated on Castle Hill, were opened to the public in 1925, and a War memorial has been erected on Oliver's Mount. The herring fisheries have been successful, and seven firms were engaged in packing and curing in 1924. A scheme for the improvement of the harbour to meet the growing demand has been drawn up. A special excursion station, half a mile from the main railway station, has been built to provide for the large numbers of summer visitors.

**SCARFOGLIO, EDOARDO** (1860–1917), Italian journalist, was born at Paganico (Aquila). He was one of the most vigorous and ablest journalists of his time and an excellent newspaper manager as well as editor, although some of his journalistic

methods were much criticised. He founded the *Corriere di Roma*, the *Corriere di Napoli*, the *Ora* of Palermo and the *Mattino* of Naples. It is with the latter paper, which he owned and edited for many years, that his name is chiefly associated. He was the husband of the novelist Matilde Serao (see 24.661) from whom, however, he had been separated for many years. He died at Naples Oct. 6 1917.

**SCARLET FEVER:** see INFECTIOUS FEVERS.

**SCEPTICISM** (see 24.306) means in Greek philosophical (*σκεπτομαι*) usage to hesitate, reflect, examine, consider pros and cons, unable to arrive at a decision; to surmise rather than assert. Like certain general terms it conveys one meaning to the technical philosopher, another to the average man. Strictly defined, it is denial of capacity to know reality; that is to say, the human mind, by its very constitution, can never comprehend the ultimate nature of things. For ancient sceptics, the senses deceive, therefore what seems to him to be true for each individual, rendering fundamental agreement out of the question.

For modern sceptics, the senses alone merit reliance, and, being what they are, confine one to appearances, if not to illusion. But this meaning belongs to the rarefied region of pure theory; so much so that all-round denial has been the exception even among professional thinkers. Hence the historical importance of the less stringent, even popular usage. For, in general acceptance, scepticism commonly suggests denial of current or customary beliefs, pertaining to a definite system usually, and this, in turn, often theological.

*Transitional Periods.*—Taken thus as a repudiation of traditional or authoritative views, it so far tallies with the stricter philosophical definition in that scepticism has as matter of history flourished most during periods of transition when attacks upon previous systematic (or even common sense) constructions were rife. Obvious examples are furnished by the assaults of the Sophists upon the Greek cosmologists; of Pyrrho and his pupils upon the followers of Plato and Aristotle; of the Middle and New Academies upon Chrysippus and the Stoics; of Sextus Empiricus upon all the principles of Graeco-Roman thought; of Montaigne upon scholasticism; of Glanvil upon the crusted Aristotelians of the Oxford schools; of Locke upon certain aspects of Cartesianism; of Hume upon Locke and the doctrine of representative perception; of Kant upon natural theology; of L. Feuerbach upon Hegel; of agnostics upon the spiritual interpretation of nature and man; of Nietzsche upon the practical postulates of European Christendom.

All agree in repudiation of what they hold to be "overpast standpoints," and, on the whole, with the exception of the thoroughgoing Greeks and Hume, they strike at a definite group of doctrines rather than at the validity of experience itself. Thus, in the light of history, scepticism generally implies dissent from dominant judgments. It may, although it commonly does not, assert human incapacity to grasp ultimate Reality, but this remains the precise philosophical implication. And, when recent movements came in question, the more general meaning is also the more apposite, thanks to the variety, not to say confusion, of "modern" thought.

*Compromise and Instability.*—Hume aside, scepticism was restrained during the 17th and 18th centuries by a silent compromise which had profoundest statement from Leibniz, most popular from Paley. Rationalism and its theological ally, Deism, agreed to extend "mechanical explanation" to the known universe, always on the understanding, however, that the physical order was secondary because dependent upon a deity whose existence could be demonstrated by abstract proofs. Quite apart from its intellectualism, against which Rousseau revolted, this compromise was inherently unstable. For, as Kant was to indicate, on such premises objective validity attached only to the objects of mathematico-physical science. The euthanasia of Deism, Hume's work, put the agreement out of court.

*Positivism and New Types.*—Further, during the same centuries, the methods of measurement and enumeration achieved extraordinary success, so that, by 1850, a new scepticism, in the shape of positivism unaware of its own dogmas, acquired vogue.

This was the heyday of materialism. The natural universe, with "matter" as substratum, came to be viewed as a given changeless system wherein everything followed from an irreversible cosmic order. The spiritual must be accounted merely a side-issue, devoid of intrinsic reality. On this scheme gravitation, electricity, magnetism and other forces were paraded as properties of matter—all else betrayed the taint of illusion or, to be plain, superstition. The hidden postulate—that nothing is valid save sense perception—inevitably led to dogmatism. Hence new types of scepticism arose successively, agnosticism the earliest while, very gradually during the final quarter of the 19th century, more rapidly during the first quarter of the 20th, the theological aspect of the issue fell in shadow, thanks to unprecedented extension of natural knowledge and profound socio-economic changes.

*The Reign of Law.*—The mechanical conception of nature ruled between 1850 and 1870. The atomic theory, reverting to implications as old as Democritus, the theorem of the conservation of energy when energy was accounted a purely mechanical principle, the early hypotheses of physiology after the enunciation of the cell-theory, and the doctrine of evolution thrust into physical categories, lent seeming authority to the uniformity of "matter" as the whole import of the uniformity of nature. The "reign of law," reducing all phenomena to motion, appeared to warrant an ultimate philosophy bound to oust "Romantic" sentimentalism. Experiential test had established calculable truths, therefore it alone can guarantee the truth. In short, Hume's view, that nothing is valid save sense-perception, came to be identified with the system of actual science.

Huxley, to select the most notable name from many, did not catch the theoretical contradiction. Nevertheless, he was among the first to divine the practical difficulty. In *Evolution and Ethics* (1889), he serves notice that, whatever we may say of nature, we dare not treat it as the source of ethical judgments. Accordingly, the universe is two; experience confronts us with incommensurables, which compel agnosticism; for, as concerns the good and the beautiful, the stark unmorality of nature forces us to fall back upon principles incapable of demonstration. Beset by inner strife, experience could not rest here. Push the human factor, and, as Aliotta points out, a *sensorial mythology* is substituted for a mechanical. Exact science ceases to be a description of the course of things; its office is reduced to that of a valuable guide through the maze of events, leading to an economical adjustment of ideas. Agnosticism was quietly dispelling the notion that "force" is "rate of change in momentum;" it was casting doubt upon the grim ultimate which had taken the place vacated by the Supreme Being central to the powerful tradition of natural theology.

*Naturalism.*—Meanwhile, other influences were leaving their mark, and this agnosticism lost point. The conjoint results of the historical and biological sciences, all presupposing the framework of evolution, served to create a fresh positivism—naturalism. But this type of scepticism maintained itself intermittently. Its silent dogma proved too vulnerable. The doctrine that the terminology of evolution is in every way preferable, because it connects man and his creations with the other phenomena of the universe, obviously implies a plan already elaborated or informed by reason of some sort; and this order reduces to the principle that, if any event can be traced to its origins, explanation then and thereby supervenes. One kind of causality (causality itself remaining unexamined) must bear the entire burden of the possibility of the situation. Like the mechanical theory before it, predeterminate evolution, unable to abide its own simplicity, loosed fresh doubts.

Current forms of scepticism bear intimate relation to discoveries in the natural sciences and psychology, to the perspective induced by the historical outlook, and to social displacements accompanied by the development of anti-intellectualism. A summary (and therefore partial) statement follows:—

*Physiologism.*—Things are external to us in space. If so, the physiological conditions antecedent to perception interpose a veil between us and objects; direct knowledge is ruled out.

Again, the cerebrospinal states on which perception depends may as well be effects of disturbances within the organism as of stimuli from without. Evidently, this view assumes the existence of objects out of relation to consciousness; also that one part of knowledge is valid, disclosing, as it does, pertinent reasons for the dubiety of perception.

*Psychologism.*—Granted that the mind is merely a "natural object," it occurs under the condition of time no less than of space. But reference to past time presupposes memory, and to future time anticipation. Psychologically, both are untrustworthy, therefore man is confined to the specious present. In any case, whatever may be said for knowledge derived from the past, the future baffles penetration; even "laws of nature" may alter or lapse. It would seem to follow that all experiential conjunctions are casual. Scepticism of this kind involves the dogma that hypotheses as to uniformity are inadmissible, and that objective "fact," other minds included, is at best a perilous inference. It may be added that Behaviourism is dogmatic rather than sceptical, being a subtle recrudescence of materialism.

*Historicism.*—This is sometimes treated as if it were identical with naturalism; that is, given an evolving series, discovery of origins suffices for "explanation," not merely of "species," but also of "values" in the spiritual and social life. The underlying assumptions are too plain to require comment. Thus, in its sceptical drift Historicism rather implies that, on review of the past, all opinions and, equally, their practical consequences, in institutions, etc., can be shown to have been bemused by hopeless diversity of judgment. In particular, thinkers, who profess to decide fundamentals, exhibit irremediable contradiction. It is absurd, then, to claim that ultimates are capable of settlement. This view involves a negative dogma, by denying the possibility of progressive insight—hypothesis can never rise to theory. The process of phenomena, each member its own witness, hides aught that may lie behind.

*Pragmatism.*—In so far as it embodies a mere protest against certain types of philosophy, pragmatism cannot be identified with scepticism off-hand. But, being a species of geneticism, it favours sceptical tendencies. "Logical forms and structures are distinctions *within* the process of reflective and experimental enquiry." If so, all "laws" must be judged evanescent. On this score, pragmatic geneticism and futurism are anti-intellectual. Notwithstanding, they embrace belief in the creative function of an evolutionary process (Bergson), and justify the voluntaristic creed of modernism (Blondel). Even so, the reason for the validity of the hypothesis is made secondary to other considerations. Consequences are *good*, because subserving happiness, etc., not *true*, because in agreement with a *ratio essendi*. Hence the sceptical thrust Truth is relative to individual activity, which, frankly, happens to be in continuous process of transmutation. Thus, truth can never be more than the best relevant, temporary adjustment; hence, all questions about the truth must be reckoned artificial. Coming in at the death, intellect can but offer bad reasons for manifest effects. Meantime, it were prudent, perhaps, to regard pragmatism rather as a search for a technique by a generation eager to formulate new values than as bare scepticism. Taken thus, it employs dogmas of its own—reality on the make in linear progress, for example. Nevertheless, it is the symptomatic philosophy of a period of disintegration, often doubtful whether the "world-spirit" be for it or against it, and seeking a criterion in "social utility."

The achievements of knowledge in modern times have rendered precise scepticism unfashionable. Moreover, the doctrine basal to scepticism is now well understood to imply a dogmatic reference. The deepest doubt has already gone beyond doubt. For the rest, temporary scepticisms would seem to oscillate between attempts to recover the irrecoverable, which necessarily land in mysticism, and protests against "conventional thinking," which, as recent movements show, run the gamut between suggestive criticism at the upper and indefensible *goujaterie* at the lower level. Being what it is, rational experience has some basis (even if we cannot as yet fathom it fully), or we must account it a miracle.

**BIBLIOGRAPHY.**—George Santayana, *Scepticism and Animal Faith* (1923); W. Pepperell Montagu, *The Ways of Knowing and the Methods of Philosophy* (1925). (R. M. W.\*)

**SCHACHT, HJALMAR** (1877– ), German financier, was born at Tingleff, near Flensburg, Jan. 22 1877. After studying political economy, he became secretary of the *Handelsvertragsverein* (Trade Agreements League) 1901–3, and was then deputy director of the Dresden Bank until 1916. From 1916 to 1923 he was a member of the Board of the Nationalbank für Deutschland, afterwards the Darmstädter und Nationalbank. He was appointed president of the German Reichsbank in Dec. 1923. In 1924 he collaborated in the Conference of London and the deliberations of the Dawes Committee. Dr. Schacht also established the Gold Bank of issue (*Goldnotenbank*).

**SCHER, REINHARD** (1863– ), German sailor, was born at Oberkirchen, Hesse-Nassau, Sept. 30 1863. After serving in Cameroon and East Africa, in 1903 he was given command of the 1st torpedo division. In 1910 he became chief-of-staff of the High Sea Fleet under Von Holtzendorf and in 1913 became commander of a battle squadron. At the outbreak of the World War he was stationed at Kiel with his squadron. In Jan. 1916 he was placed in command of the German High Sea Fleet, which he led at the battle of Jutland. On July 2 1918 he succeeded Von Holtzendorf as chief of the Admiralty Staff, but on Nov. 14 1918 he was placed on the retired list, and took up residence in Weimar. Scher's account of the battle of Jutland appears in his book *Deutschlands Hochseeflotte im Weltkrieg* (1920). (See GERMANY: NAVAL POLICY.)

**SCHEIDEMANN, PHILIPP** (1865– ), German politician, was born at Kassel July 26 1865. In 1903 he entered the Reichstag as deputy for Kassel, and in the course of the World War became leader of the Majority Socialists. He voted for the government's war credits and supported its policy up to 1917, when he was associated with Erzberger in the "Peace Resolution" of July 19 1917, which demanded "peace without annexation or indemnities." He was already exercising influence in German internal politics and was frequently consulted by Bethmann Hollweg. In June 1918 he became vice-president of the Reichstag, and on Oct. 3 secretary of state without portfolio in Prince Max of Baden's Cabinet. On Nov. 9 Scheidemann proclaimed the German Republic from the buildings of the Reichstag. On Nov. 10 he was one of the three Majority Socialists who formed the first Provisional Govt. of the Republic. Although violently attacked by the Spartacists and Minority Socialists as a "counter revolutionary," he undoubtedly helped to save his country from bloodshed and anarchy, and on Feb. 8 1919 was elected president of the first republican ministry of the Reich by the Constituent Assembly at Weimar. On June 20 1919 he vehemently opposed signing the Treaty of Versailles and resigned when a majority of the government decided to sign. He then resumed the leadership of the Majority Socialists in the National Assembly and subsequently in the republican Reichstag. In Jan. 1920 he was elected first burgomaster of Kassel. His reminiscences *Der Zusammenbruch* published in 1921 form a valuable historical document. (See also GERMANY: Political History.)

**SCHELDE.**—The dispute between Belgium and the Netherlands over the control of the Schelde estuary is dealt with in the articles BELGIUM; NETHERLANDS.

**SCHENECTADY, N.Y., U.S.A.** (see 24.319).—The population increased 21.8% in the decade after 1910, reaching 88,723 in 1920 (of whom 20,564 were foreign born), and was estimated by the Census Bureau at 102,161 in 1925. Additions of territory by 1925 had brought the area up to 10.34 square miles.

In the year 1924 when the population reached 100,000 a "progress exposition" was held specially to celebrate the following achievements: the construction of the fine, broad Erie boulevard, along the abandoned bed of the Erie canal; the construction of the Great Western Gateway Bridge across the Mohawk river, connecting the highway systems of the east and south with those of the north and west; the building of the Hotel Van Curler at the eastern bridgehead, commanding a wide view of the Mohawk valley; the installation of "intensive" street lighting; the com-

pletion of the Union College Memorial Chapel, built by public subscription; the establishment of a community chest for financing philanthropic agencies; and the expansion of the two leading industrial establishments, the General Electric Co. and the American Locomotive Company. The two latter dominating industries employed (1925) 23,000 and 5,000 persons respectively. The Schenectady establishment of the General Electric Co. is not only the largest of the company's manufacturing concerns, but it includes also the general offices and research laboratories for the entire company, and the broadcasting studio of WGY. The value of all factory products in the city was \$38,165,000 in 1909, and \$106,531,000 in 1919.

There were in 1925 31 public schools, with a roll of 17,840 pupils, including 1,031 in the continuation schools. The city has five parks, of a total area of 280 ac., with tennis courts, lakes for swimming and boating and four golf courses. There are 37 playgrounds for children, and a health centre, conducted by the Health Dept. which includes various specialised clinics.

**SCHIFF, JACOB HENRY** (1847–1920), American banker and philanthropist, was born at Frankfurt-on-Main, Germany, Jan. 10 1847. He was educated in the schools of Frankfurt and for a time worked in a bank. In 1865 he went to New York City and organised the brokerage firm of Budge, Schiff & Co. In 1875 he married a daughter of Solomon Loeb, head of the banking firm of Kuhn, Loeb & Co., was taken into the firm and, on Loeb's retirement in 1885, took his place. Largely due to Schiff's energy, the firm greatly expanded its business and became known throughout the financial world. In 1897 his house assisted E. H. Harriman in reorganising the Union Pacific Railway. In 1901 a struggle took place between the Schiff and Harriman interests on the one side and James J. Hill and J. P. Morgan on the other for possession of the Northern Pacific Railway. The resulting compromise was the formation of the Northern Securities Co. as a holding company for their joint interests (see 27.733). In his later years he gave much personal attention to charities, especially for the Jewish people. He was a founder and president of the Montefiore Home for Chronic Invalids, New York City. In 1903 he presented a Semitic Museum building to Harvard University. He died in New York City Sept. 25 1920. His estate was estimated at about \$50,000,000. He bequeathed \$1,350,000 to various institutions, most of which had received benefactions during his life.

**SCHIMMEL, HENDRIK JAN** (1825–1906), Dutch poet and novelist (see 24.326), spent his last years in work on spiritualistic research, and died at Bussum in 1906.

**SCHISTOSOMIASIS:** see BILHARZIASIS.

**SCHLESWIG** or **SLESVIG** (see 24.334), a district now divided between Denmark and Germany. North Schleswig (Danish) has an area of 1,938 sq. m. and a population of 166,895; South Schleswig (German) forms part of the Prussian province of Schleswig-Holstein, with a total area of 5,802 sq. m. and a population (1925) of 1,534,817.

During the years immediately preceding the World War, German officials and private societies continued their efforts to force Germanisation on the Danish inhabitants of Schleswig by colonisation of the land with Germans and discouraging the use of the Danish language. But their efforts only strengthened Danish national consciousness, so much so that in Aug. 1914 the possible effects of this spirit were so feared in Germany that a number of prominent Danes were arrested and imprisoned. Among them was H. P. Hanssen, a member of the Reichstag, who, however, was released very quickly. During the War the expression of desire for union with Denmark was silenced, both owing to the German censorship and the Schleswig Danes' anxiety not to let Denmark abandon her neutrality. Yet the hope of ultimate union with Denmark was not abandoned; in Aug. 1915 Hanssen indicated on a map to a German colleague a frontier very similar to that now established.

On Oct. 23 1918 Hanssen raised the demand for reunion in the German Reichstag; on the same day the Danish Rigsdag unanimously passed a resolution in favour of a readjustment of the frontier on the principles of nationality. On Nov. 28 the Danish

Govt. communicated its wishes to the Allies, and when the Peace Conference in Feb. 1919 reached the discussion of the Schleswig problem, a united Danish North Schleswig delegation was sent to Paris to present the Danish point of view: a plebiscite *en bloc* in North Schleswig (zone 1); a community ballot in Central Schleswig and Flensburg (zone 2) and voting rights to all those born in the voting district. The Peace Treaty, presented May 7, further provided for a plebiscite in a third zone, but this was later dropped.

On the Peace Treaty coming into force (Jan. 10 1920) an international commission took charge of the plebiscite district. Zone 1 gave 75,431 votes for Denmark, 25,329 for Germany (Feb. 10); zone 2, 48,148 votes for Germany, 13,029 for Denmark (March 14). The frontier established by the treaty of July 5 1920 gave effect to this verdict, and restored to Denmark that part of Schleswig which lies north of the Flensburg fjord, and of a line drawn approximately west from it. On July 7 the international commission handed over the executive power in Zone 1 to Denmark.

The results of subsequent elections have shown the line to be fairly drawn. The highest Danish vote polled in Germany has been 7,700 (1924)—insufficient to return a Danish representative. The German votes for the Rigsdag in 1921 and 1924 totalled 7,500, returning one member under the system of proportional representation prevailing in Denmark. In each country some Social Democrats do not vote nationally. The Treaty of Versailles imposed no special obligations upon Denmark with regard to her German minority, considering the Danish constitution to offer adequate safeguards; on the same grounds the Danish Govt. has declined the proposal for a special treaty with Germany for reciprocal protection of the minorities, a measure which might easily lead to undesirable interference by the Government of one country in the affairs of another. The Danish Govt. has, however, offered the German minority every facility to maintain and develop its culture on a German basis. The entire school system of North Schleswig has been reorganised with this view; parents are allowed to decide whether they will have their children educated in German or Danish at primary schools, while the German private schools receive grants from the State on the same condition as the Danish private schools. (G. M. G.-H.)

**SCHLICH, SIR WILLIAM** (1840-1925), British forestry expert, was born at Darmstadt, Germany, Feb. 28 1840, and educated there and at the University of Giessen. In 1866 he entered the Indian Forests Department, became conservator of forests in 1871, and 10 years later inspector-general of forests to the Govt. of India. In 1886 he became a naturalised British subject. He was one of the pioneers of the study of forestry in England, organising in 1885 the first school at Cooper's Hill, which was transferred to Oxford in 1905. He was appointed professor of forestry at Oxford the same year and retained the post until 1919. Among his books on the subject are: *A Manual of Forestry* (1889-95; new ed., 5 vol., 1925) and *Forestry in the United Kingdom* (1904). In 1901 he was elected a fellow of the Royal Society, and in 1909 he was created K.C.I.E. He died at Oxford Sept. 28 1925.

**SCHLIEFFEN, ALFRED, COUNT VON** (1833-1913), Prussian soldier, was born on Feb. 28 1833 in Berlin, where his father, an officer, lived. The Schlieffen family is of Pomeranian origin and is now found chiefly in Mecklenburg. Schlieffen came from the same nobility and the same province as two other great field marshals, Blücher and Moltke.

In his youth he studied for a short time at Berlin University before he became an officer. He attended the military academy (*Kriegsakademie*) and served in the war of 1866 against Austria and in that of 1870-1 against France as a general staff officer. In 1891, after following the usual career of a general staff officer, he was appointed chief of the general staff of the army. He held this position for 15 years, during which period he exercised an extraordinary influence on the development of the German general staff and the whole German army. There was ever present with him the problem of a war on two fronts which would have

to be waged with a single army, far superior in numbers and material to any that had been employed in previous wars. He energetically promoted the training of general staff officers in the leading of huge armies and urged on the development of the German army's technical equipment to the end that rapid transfer and sure handling of the troops might be ensured. Finally he threw the whole weight of his position and authority into the endeavour to equip the army with mobile heavy artillery. He retired in 1907.

On his retirement he proceeded to pronounce his views on war in literary form and he is indeed far better known in his capacity of author than as chief of the general staff of the army. In military science Schlieffen was a disciple of Clausewitz, the Prussian philosopher of war, who in his turn had deduced his doctrine of strategy from Napoleon. Field-marshal Von Moltke, whose successor and disciple Schlieffen was, had also based his ideas on Clausewitz, and it was the Napoleon-Moltke strategy that Schlieffen sought to carry on. The essence of their doctrine is that the enemy forces should be not merely defeated but destroyed. To this end it seemed to them necessary that not only the front but the flanks and if possible the rear should be attacked, so that the enemy should be forced to give battle on a reversed front. Schlieffen pushed this system to its logical conclusion. He saw Germany surrounded on all sides by enemies who, together, were far more powerful than herself. It seemed to him that the only salvation lay in opposing one of the enemies with a superior force, inflicting on him a decisive defeat, and then, using a well-developed network of railways and manoeuvring on inner lines, turning upon the other enemy against whom until then a defensive attitude would have been maintained. For this end rapidly decisive blows were needed and his writings aimed at proving such blows to be possible and showing how troops could be handled for that purpose.

With a marked singleness of purpose Schlieffen sought out the appropriate examples in military history and presented them in a new guise. His works are not military history in the accepted sense; they do not purport to describe objectively the course of campaigns and battles. He used military history as a source from which to draw instances which corroborated the doctrines with which he sought to imbue his pupils and his readers. His books are in fact definitely instructional. He points sarcastically to the errors made by commanders and subordinate commanders and dismisses with cutting irony those opinions which opposed his own. It is plain from his writings how anxiously he watched the military-political situation of his own country and how apprehensive he was lest the grave hour should find, in the position he had had to leave, a man unequal to the overwhelming task. "A commander-in-chief must be inspired by something superhuman, something supernatural, call it genius or what you will."

Schlieffen died in Berlin on Jan. 4 1913, but in 1914—seven years after his retirement—he still played his part in the world's history; for on retiring, he had bequeathed to his successor, General Moltke the younger, the plan for deployment against France. This plan embodies his strategic convictions. It is at once immensely bold and also simple. Only the bare minimum was to remain facing the Russians; in the West the left flank was to be held back and the troops in Alsace were to withdraw behind the Rhine and face attack on the line Metz-Strasbourg. The bulk of the army was to deploy on the right flank and, pivoting on Metz, to drive forward against the line Dunkirk-Verdun. In this way the strongly fortified east front of France would be turned and the French army forced to give battle with a reversed front. Schlieffen intended not to give a recipe for victory, but to indicate the operative idea which, if logically carried out, would make possible the swift decision which alone could save Germany from her doom. The German army commander of 1914 considerably diluted the Schlieffen plan and, particularly in its execution, followed other courses than those pointed to by the dead strategist. And so it was that the inspired scheme of Schlieffen did not bear the fruits which were expected.

How armies are to be handled in the Schlieffen spirit the war on the Eastern front showed. The battle of Tannenberg has very justly been called a super-Cannae, and the campaign of Lodz, the German attack against the Warsaw-Thorn line—the best-conceived operation of the whole War, which was directed solely against the right flank of the Russians—rests upon Schlieffen's ideas. It was not granted to the field marshal to test his strategic thoughts in the fire of battle, but his influence on the German leadership is incontestable and his lifework cannot be ignored by anyone who intends to study the history of the World War. For Schlieffen's writings, see Graf Schlieffen, *Gesammelte Schriften* (Berlin, 1913); *Cannae*, selection from the above (Berlin, 1925).

**SCHMIDT, WILHELM** (1868– ), Austrian philologist and Roman Catholic priest, was born at Hörde, Westphalia. He held the chair of primitive language and culture in the University of Vienna and devoted himself to the isolation and classification of the Austric family of languages (see *PHILOLOGY*). His works include:—*Die sprachlichen Verhältnisse Ozeaniens* (1900); *Grundzüge einer Lautlehre der Khasi-Sprache* (1905); *Grundzüge einer Lautlehre der Mon-khmer-Sprache* (1906); *Die Sprachlaute* (1907); *Die Stellung der Pygmäenvölker in der Entwicklungsgeschichte des Menschen* (1910); *Der Ursprung der Gottesidee* (1912); *Ethnologische Bemerkungen zur theologischen Opfertheologie* (1912); with W. Koppers, *Völker und Kulturen* (1924); *Die Sprachfamilien und Sprachenkreise der Erde* (1925).

**SCHMOLLER, GUSTAV** (1838–1917), German political economist (see 24.344), died in Bad Harzburg June 26 1917.

**SCHNITZLER, ARTHUR** (1862– ), Austrian playwright and novelist, was born in Vienna May 15 1862. He took a medical degree, and practised for a time as a physician. In 1908 he won the Grillparzer prize. Schnitzler first began to write plays and fiction in the 'nineties, and from that time onward his narrative powers steadily increased, while his dramatic powers hardly diminished. His style is informed by a kind of tempered realism, never quite losing sight of beauty. His province is chiefly the intellectual circles of pre-War Vienna; his problems those of love, life, death and art. His distinction is piquant and graceful dialogue. In modern costume his characters move confidently across his stage; in historical, more uncertainly; nor did his verse attain the inimitable charm of his prose.

The most remarkable of his plays are: the *Anatol* cycle (1898); *Liebelei* (1896); *Der grüne Kakadu* (1899); *Der einsame Weg* (1904); *Der junge Medardus* (1910); *Professor Bernhardt* (1912); *Die Schwestern* (1919); and the much-disputed *Reigen* (printed privately in 1903, produced in 1920). Conspicuous among his tales are the great novel *Der Weg ins Freie* (1908); and the short stories, *Lieutenant Gustl* (1901), *Casanovas Heimfahrt* (1918), Eng. trans. *Casanova's Homecoming* (1922); and *Fräulein Else* (1924, Eng. trans. 1925).

See Monographs by J. Kapp, *Arthur Schnitzler* (1912); and R. Specht, *Arthur Schnitzler* (1922).

**SCHOBEL, JOHANN** (1874– ), Austrian politician, was born and educated in Upper Austria, entering the Imperial Austrian police service as a young man, and became the Austrian president of police in 1918, some months before the revolution. On the proclamation of the Austrian republic (Nov. 12 1918), Schobel immediately placed his force at the disposal of the new Government, and by this action and by his moderate conduct in general did much to ensure a peaceful and bloodless change of régime. At the same time, he succeeded in securing the safety of the ex-Imperial family, whose departure from Vienna he supervised. During the two years of social democratic Government which followed, Schobel's force was reproached by extremists with being reactionary, quite unjustly, as he aimed at strict impartiality. His administrative ability, and above all, his conspicuous honesty, gained him the confidence of all moderate opinion in Austria, and especially of the inter-allied missions and advisers.

Largely because he was known to enjoy this confidence it was

expected that if he were chancellor, the Allied and Associate Powers would be willing to grant the large loan necessary to restore Austria's chaotic finances, and he was selected to form a non-party ministry in June 1921. His term of office was not so successful as all friends of Austria had hoped, since the requisite loan was still delayed and Schober, more honest than brilliant, saw that his administration, minus loan, did not satisfy Austrian public opinion. Nevertheless, he really took the first step towards establishing friendly relations between Austria and her neighbours when he concluded the pact of Lana with Czechoslovakia Dec. 16 1921 (see *AUSTRIA*). This move aroused the hostility of the pan-Germans, who formed a part of the Government coalition, and who resented any pact with Czechoslovakia as putting difficulties in the way of the ultimate *Anschluss* with Germany. They withdrew from the Government coalition. The Christian Socialists were not strong enough to govern alone against the opposition of the Social Democrats. On May 24 1922 Schober resigned the chancellorship and returned to the post of president of police.

**SCHOLL, AURELIEN** (1833–1902), French author (see 24.356), died in Paris April 16 1902.

**SCHÖNBERG, ARNOLD** (1874– ), Austrian composer, was born in Vienna Sept. 13 1874. At an early age he began to study violin and cello and also to compose chamber music. In musical theory he was self-taught. After writing a number of songs he composed in 1899 the string sextet *Verklärte Nacht*; and in the following year he commenced work upon *Gurrelieder*, a ballad cycle in three parts for chorus and full orchestra, which was eventually produced in Vienna, 1912–3. In 1903 he began his career as a teacher of theory in Vienna; meanwhile (1902–3) he had composed the symphonic poem *Pelléas und Mélisande*. Further songs and ballads followed and the years 1907–10 saw the development of Schönberg's art from the classical to the new period. He was largely inspired by the painting of Kokoschka and others who inaugurated a new artistic movement at that time. His new style was revealed in a number of piano pieces and the mono-drama *Erwartung*. In 1911 he moved to Berlin and in the following year had performed one of his most famous works *Pierrot lunaire*, a cycle of 21 poems for recitation with a piano, flute, clarinet, violin and cello. In 1915–7 he was working upon an oratorio, *Jakobsleiter*, and in 1918 he founded in Vienna the society for private musical performances. A revised edition of his manual *Harmonielehre* (1911) was issued in 1922. See E. Wellesz *Arnold Schönberg* (1924).

**SCHÖNHERR, KARL** (1869– ), Austrian dramatist, was born at Axams in the Tyrol, Feb. 24 1869. He took his degree in medicine, but soon began to devote himself to literature. He began with dialect poems of an unassuming nature and with short stories, but in 1897 he turned his attention to drama and the stage with the unpublished *Judas von Tirol*. Schönherr stood midway between realism and symbolism, and expressed himself in a vigorous and original style. His accomplished technique, applied frequently to peasant or medical life, enabled him to evolve a successful drama with a very limited number of characters. In his pieces, quite elementary and simple emotions, and the problems and crises arising out of them, are presented with inexorable consistency. His treatment was less sure in the realm of fancy or of history: his most famous drama, *Glaube und Heimat* (1910), dealing with the time of the Counter-Reformation, and also *Der Weibsteufler* (1915), have a strong Roman Catholic bias. Schönherr's other important works include *Die Bildschnitzer* (1900); *Erde* (1908); *Volk in Not* (1915); *Frau Sulzner* (1916); *Vivat academia* (1922); *Es* (1923); *Hungerblockade* (1925). Most of his dramas were first produced in the Burgtheater and in the Deutschen Volkstheater in Vienna. Schönherr's other works include *Caritas* and *Aus meinem Merkbuch*, which express the same trend of thought and motif as his dramas. He won the Schiller Prize in 1908 and the Grillparzer Prize in 1911, 1917 and 1920. See monographs by Sedlmaier (1920) and Lederer (1925).

**SCHOOLS:** see *EDUCATION*; *PUBLIC SCHOOLS*; *SECONDARY SCHOOLS*.

**SCHOULER, JAMES** (1839-1920), American lawyer and historian (see 24.377), published in 1913 a seventh volume of his *History of the United States of America Under the Constitution*, covering the period of reconstruction (1865-71). The original plan of his work had been enlarged by the publication in 1899 of a sixth volume, covering the period 1861-5. He died at Intervale, N. H., April 16 1920.

**SCHREINER, OLIVE** (1862-1920), pen name of Mrs. Cronwright Schreiner, was born in Basutoland, the daughter of a German missionary. In 1882 she brought to England the MS of her first novel *The Story of an African Farm* and submitted it to George Meredith, then reader for Chapman and Hall. It was published in 1883 by this firm over the pseudonym "Ralph Iron," and proved an immediate success, entirely surpassing any of her subsequent writings in literary merit. Her later work includes *Dreams* (1891); *Trooper Peter Halkett of Mashonaland* (1897), a much-criticised attack on the first settlers in Rhodesia; *An English South African's View of the Situation* (1899); and *Woman and Labour* (1911), a fragment of an earlier MS which had been burnt during the South African War. She died at Cape Town, Dec. 12 1920. She had married in 1894 S. C. Cronwright, a member of the Cape Parliament, who afterwards took the name of S. C. Cronwright-Schreiner. He wrote *The Life of Olive Schreiner*, which appeared in 1923.

Her brother **WILLIAM PHILIP SCHREINER** (1857-1919), was born in the district of Herschel, Cape Colony. After studying law at Cape Town, and at Cambridge and London Universities, he was called to the Bar (Inner Temple) in 1882 and on returning to South Africa in the same year was admitted as an advocate of the Cape Supreme Court. He was for many years leader of the Cape Bar; in 1887 he entered Cape politics as attorney-general in the Second Rhodes Ministry. He was Prime Minister on the outbreak of the South African War, (1899). In 1914 he was appointed high commissioner for the Union in London, and he died at Llandrindod Wells, Wales, June 28 1919.

**SCHROEDER, EDUARD** (1858- ), German philologist, was born May 18 1858 in Witzenhausen. He was a high school teacher in Göttingen (1883), Berlin (1887) and Marburg (1889), and in 1902 was appointed professor of German language and literature at the University of Göttingen. His publications comprise works on old German literature, modern German philology and the history of German literature. From 1890, in conjunction with Gustav Roethe of Berlin, he published the *Zeitschrift für deutsches Altertum und deutsche Literatur*.

**SCHÜCKING, WALTER** (1875- ), German jurist, was born Jan. 6 1875 at Munster in Westphalia. He taught at the universities of Breslau and Marburg 1900-21, and in 1921 was appointed a professor at the Berlin commercial high school. In 1919 he was appointed a member of the National Assembly and chief German delegate to the Peace Conference at Versailles. In 1920 and again in 1924 he was elected to the Reichstag and became one of the leaders of the German Democratic party.

His works include: *Das Küstenmeer im internationalen Recht* (1897), "Die Verwendung von Minen im Seekrieg" (in Niemeyer's *Zeitschrift*, vol. 16), *Die Organisation der Welt* (2nd ed. 1909), *Der Staatenverband der Haager Konferenzen* (1912) (Eng. trans. 1918), *Neue Ziele der staatlichen Entwicklung* (3rd ed. 1913), *Internationale Rechtsgarantien* (1918), *Die Satzung des Völkerbundes* (2nd ed. 1924), *Garantiepolitik und Rüstungsbeschränkung* (1924), *Das Genfer Protokoll* (1924).

**SCHULTZ, HERMANN** (1836-1903), German theologian (see 24.382), died in 1903.

**SCHURMAN, JACOB GOULD** (1854- ), American educationalist and publicist (see 24.386), was appointed in 1912 U. S. Minister to Greece and Montenegro, serving one year. In 1915 he was first vice-president of the N. Y. State Constitutional Convention. In Oct. 1917 he was appointed a member of the N. Y. State Food Commission. He was opposed to many of President Wilson's policies, especially in connection with Mexico, and also to Article X. of the Covenant of the League of Nations, believing that it would involve the United States in war. He resigned the presidency of Cornell University in 1920,

giving as his reason that every great institution was entitled to a new chief executive at least once in a quarter of a century. Appointed minister to China in 1921, he returned to the United States on leave of absence in Aug. 1924, and was appointed ambassador to Germany, March 17 1925. Among his later works are *The Balkan Wars, 1912-1913*; lectures at Princeton (1914); *Why America is in the War* (1917).

**SCHWAB, CHARLES MICHAEL** (1862- ), American capitalist, was born at Williamsburg, Pa., April 18 1862. He was educated in the public schools and at St. Francis College, Loretto, Pa., where he gained an elementary knowledge of engineering. From 1878 to 1880 he was a clerk in a store at Braddock, Pa., and then became a stake driver in the engineering corps of the Edgar Thomson Steel Works of Carnegie Bros. & Co. His ability brought him rapid promotion and in 1881 he was made chief engineer and assistant manager. Six years later he was appointed superintendent of the Homestead Steel Works. In 1889, on the recommendation of Henry Frick, he was made general superintendent of the Edgar Thomson Steel Works, and in 1892, after the formation of the Carnegie Steel Co., he was made also general superintendent of the Homestead Works. In 1897 he was elected president of the Carnegie Steel Co., and when this was merged in 1901 in the U. S. Steel Corp. he was made president of the latter. He resigned in 1903. He then turned his attention to shipbuilding and a few years later with other capitalists secured control of the Bethlehem Steel Corp., which owned the Bethlehem Steel Co., and several other corporations engaged in the iron, steel and shipbuilding business. He was made chairman of the board of directors.

After the outbreak of the World War in 1914 and before the United States entered it, these companies filled orders for the Allies aggregating between 400 and 500 million dollars. It was generally understood that German interests made attempts to secure control of the Bethlehem works in order to shut off munitions from the Allies, and a report that Mr. Schwab was offered \$100,000,000 for his interest was never denied by him. The division of the stock of the Bethlehem Steel Corp. in 1917 into two classes, A and B, the latter being publicly owned and non-voting, an arrangement designed to prevent German money from obtaining a voice in the company's control, set a precedent for later issues of this type in the financial world. After America's entrance into the War, at the urgent request of President Wilson Mr. Schwab became in April 1918 director-general of the shipbuilding board of the Emergency Fleet Corporation. His power of rousing enthusiasm among workers by personal contact immediately produced results. The resulting output for 1918 was 410 steel vessels, 106 wooden ships and 10 composite ships, a total of 526 vessels. After the signing of the Armistice in Nov. 1918, he resigned from the Emergency Fleet Corp. and returned to his position as chairman of the board of directors of the Bethlehem Steel Corporation. His benefactions include a Catholic church at Loretto, as well as buildings and endowment for St. Francis College; a church at Braddock, Pa., a school at Weatherly, Pa., and a country home on Staten Island, N. Y., for children of the New York Foundling Hospital.

**SCHWEINFURTH, GEORG AUGUST** (1836-1925), German traveller and ethnologist (see 24.392) in 1918 brought out a revised edition of his principal work *The Heart of Africa*. He died in Berlin Sept. 20 1925. His botanical and geological collections were given to the Prussian state.

**SCIENTIFIC MANAGEMENT.**—Originally this doctrine had reference particularly to the management of shop operations in industrial establishments, but it has been given broader significance. It holds that the accurate investigative methods of science may be utilised to discover the objective facts and laws which govern effective accomplishment of purposive effort, and that such facts and laws, expressed in standards of purpose, instruments and methods, permit control which effects accomplishment with the most economical expenditure of human and material energies.

*Origins and History.*—Scientific management did not originate as an argument *a priori*; it was the generalisation of an engineer

executive, Frederick W. Taylor (*q.v.*), derived from analysis of controlled experiments in management of shop operations which had been stimulated by problems arising out of particular industrial conditions. The last three decades of the 19th century in the United States were characterised by a second industrial revolution. There was rapid expansion of transportation facilities, which consolidated local markets into a national market, increase of available raw materials and of machinery for their fabrication, increase of population through immigration which enlarged both production and consumption capacity, and a consequent rapid development of large organisations to secure the advantages of large scale production and distribution. This development brought with it serious problems of management, particularly the problem of supervising and co-ordinating the work of men no longer under the immediate supervision of owner-managers. The "management movement," expressing social consciousness of these problems, was generated by these circumstances. This movement became vocal among mechanical engineers because they who were designing and installing the new machines were called upon to devise methods of control in their operation.

Moreover, the mechanical engineers, organised into a professional body (1880), had available the only forum for discussion of managerial problems. Their first attack on the problem sought a solution along the line of differential wage systems, for it was believed these would create an incentive which would accomplish indirectly the results of direct supervision. From wage incentives their attention turned to such mechanisms as cost systems, organisation and systematisation. These contributions in the early stages of the management movement were of importance, but they related to isolated phases of the management problem and did not offer any general doctrine expressing an integrated system of management.

#### THE WORK OF F. W. TAYLOR

*Taylor's Initiative.*—Such a doctrine came from Frederick W. Taylor in *A Piece Rate System* (1895), *Shop Management* (1903) and *The Principles of Scientific Management* (1911). It has served as a focal point around which have gathered the various other contributions to the management movement. Taylor as a young man had been appointed gang boss in 1880 or 1881 in a machine shop of the Midvale Steel Co., Philadelphia. Eager to secure better production, he began his supervision of workers with the driving methods of foremanship then prevalent. Controversy with the workers resulted, so distasteful that his highly imaginative and inventive faculties were challenged. Believing that a prime cause of low production was destruction of workers' good will by such autocratic actions as arbitrarily changed wage rates resulting from management's lack of precise knowledge of what constitutes a proper day's work on each operation, he began a series of investigations and experiments lasting more than 17 years and having no equal outside the field of pure science.

Fortunately, within the first few months these experiments led to positive and important results. He discovered facts and laws pertaining to elements of machine operation—to shafting, belting, machine adjustments, materials and methods of manipulation—which when analysed suggested devices and procedures to increase the output per machine at lowered unit costs without additional human effort. The combination of these best elemental conditions of each operation he set up as a standard for that operation, established identical standard conditions and methods for all machines in the shop, planned and directed more carefully the flow of work under these standardised conditions, and increased the total production of the shop to a revolutionary degree. Subsequent investigations and experiments, at the Midvale Steel Co., the Bethlehem Steel Co. and other plants, served not so much to add new fundamental data to these early basic discoveries as to enlarge their significance and prove their adaption to more complicated conditions.

*Taylor's Doctrine.*—During the early years of these experiments, Taylor formulated no theories; he was simply first a gang boss, and later foreman and engineer, concentrated upon solving

practical problems of management as they came to him. Later, stimulated by contacts at the meetings of the American Society of Mechanical Engineers, he formulated as generalisations from his observations and experiments the doctrine of scientific management.

The doctrine in the final form stated by Taylor consisted of four propositions: (1) The development of a "true science" for each operation to replace traditional, rule-of-thumb methods. This "true science" and a corresponding art for a given operation on a given machine are determined by ascertaining experimentally the combination of conditions which will yield a unit of product with least cost of human and mechanical energy, cost being chiefly a function of time consumed in the production of a unit as measured by stop-watch observations. (2) The selection of workmen and their assignment to operations in accordance with scientific analysis of their natural capacities and acquired skill. (3) Continuous instruction of workmen in the science and the art of each operation. (4) Recognition of qualitative differences, as to capacities required and the conditions of routine performance, between the function of execution in manipulating machine or tool and the function of planning and preparing work; and the grouping of operatives into two major divisions responsible respectively for these qualitatively different groups of functions.

*The Management.*—The group of workers concerned with planning and preparation Taylor conceived as the "management." Given a true science and art for each operation, and conditions surrounding an operation meeting the requirements of its art, the planning group is enabled to make calculations which will so co-ordinate operations and govern the flow of work as practically to eliminate delays, idle machine time and unbalanced production; to reduce investment in raw and worked materials, and to permit individual equitable wage payments in accordance with that increased productivity which inevitably results from the more perfect technical conditions and manipulation at each machine, and from the more precisely calculated control of work and co-ordination of specialised efforts under division of labour.

*The Taylor System.*—These propositions were the statement of a doctrine. The "Taylor System" is another matter; it is that system of practices which Taylor had built up as gang boss, foreman and engineer, from which the conclusions in the doctrines were drawn. He believed the doctrine presented truths of permanent validity, but that the details of his system would be modified by later experience. The framework of his system was as follows:—

1. A planning department in which specialist foreman and workers should (a) make the investigations from which are derived the science and art of each operation, formulate the art of each operation for the benefit of operatives in the form of an "instruction card," and establish and maintain standard conditions and standards of performance-time and wage rates; (b) plan the sequence of operations, prepare materials and equipments, and in general direct the flow of work; (c) check performance against plans as an aid to maintenance of standards.
2. Specification, to aid in selection and assignment of workers, indicating the physical, mental and temperamental characteristics required in workers on any particular operation or group of operations.
3. Functional foremen, *i.e.*, specialists in the different elements of execution, who should train the workers in the various operations. Functional foremanship is essentially instructional as opposed to driving foremanship.

Governing the mechanisms of the system here outlined was a policy of human relations which embraced such ideals as the following: arbitrary authority must give way to the reign of law in management as determined by investigation and experiment; managers and workers are each subject to the respective functional requirements of the same law; high wages are more important than big profits; high wages make low labour costs.

*Taylor's Doctrine Restated.*—Taylor was not a skilled publicist, and his statement of scientific management was not as scientific as had been his conduct and analysis of the experiments from which the doctrine was derived; yet it constituted an analysis so inclusive and logical that it has provided the dominant element in all subsequent expositions of management theory. From the point of view especially of later knowledge of social organisation and of psychological science, the significance of the doctrine becomes more impressive. It may be restated as follows:—

In modern large-scale organisation with its large investments specialisation of capital in fixed forms and division of labour, management must meet five important technical problems: 1. Conservation of the investment by greater accuracy in calculating the demands of industrial society. 2. Economy in the expenditure of productive energies by more precise specialisation of efforts. 3. More precise co-ordination of specialised efforts. 4. Economy in the expenditure of productive energies by more perfect understanding by each specialist operative of the related part he is to perform. 5. The establishment of good will among the workers to assure effective voluntary application of intelligent effort in the absence of detail supervision.

Referring to these problems in inverse order, the base for the establishment of workers' good will are: removal of the dread of intermittent employment, by more accurate determination of social demand; equitable sharing of the results of joint productive effort, by more accurate measurement of individual efforts and results in terms of standard objectives, instruments and methods; and provision for the opportunity for individual self-expression without violation of co-operative technical responsibility, by formulation of the laws of the technical situation and substitution of voluntary obedience to such laws for involuntary obedience to unstable and inconsistent individual authority.

More perfect understanding on the part of workers may be established by accurate analysis and formulation of functional relationships and of the conditions for most productive results in each elemental operation. More precise specialisation and co-ordination of specialised efforts may be accomplished by a similar analysis of functional relationships and conditions, by accurate calculations of productive capacity in terms of present and future availability, by accurate calculations of the flow of demand in terms of orders or jobs, and by understandable communications to technical co-operators informing each of his task demanded by the law of the situation. Greater accuracy in calculating the demands of industrial society is to be had by applying to the pertinent field of observation and experiment the same order of scientific method which is applied to determination of the adherent requirements of any detail operation. Practically every one of these suggested methods of solving the five basic managerial problems enumerated above were anticipated in the specific system of management which carries Taylor's name.

*Dominance of a Sellers' Market.*—For the emphasis on shop management in the early statements of scientific management there is an historical reason. It was conceived, formulated, published and discussed during a period when industry in the United States was enjoying a "sellers' market" (1880-1914), when the problem of management was chiefly one of production to meet a rapidly growing consumer demand. In these circumstances the applicability of the doctrine to other aspects of management did not receive especial consideration.

*Development of a Buyers' Market.*—However, beginning about 1921, as a result of economic maladjustments following the World War, industry in the United States experienced a "buyers' market" in which ascertainment of consumer demand and selling replaced production as the dominant problem of management. This stimulated consideration of scientific management as a doctrine pertinent to all phases of management. Utilising the methods of quantitative measurement made available by a rapidly developing statistical science, industry began to analyse consumer demand (market analysis) as it had already analysed conditions of individual machine operations, and this made possible the formulation of tasks for an enterprise as a whole and for departmental major functional units. These tasks took the form of master and departmental budgets and quotas. Market analysis and the formulation of budgets, schedules and quotas express, for the business as a whole and for its larger functional units, the major principles of scientific management—scientific method in investigation, the establishment of standards, planning and the control of operations in accordance with standards and plans.

#### SCIENTIFIC MANAGEMENT IN THE UNITED STATES

Scientific management has profoundly influenced the attitude and practice of management in the United States. This influence

has been due chiefly to the fact that in a time of necessity scientific management has offered the only consistent and inclusive doctrine concerning management, and also in some measure to the increase in the number of executives in industry who have had college or university training and are accustomed to the ideas and practices of scientific method. However, the particular system of management developed by Taylor as an expression of the doctrine is to be found in reasonable entirety in but few enterprises, although many of the elements of the system, such as segregation of planning, have been widely adopted. The conservatism in adopting the particular system has been due to fear of the practical difficulty of modifying fixed habit of conduct within the personnel of large organisations, particularly the difficulty of making such modifications with a provision which effects changes without disorganising current operations, and to uncertainty concerning the reactions of workers to the doctrine as understood by them and to specific modifications of habit involved.

*Relations with Labour.*—The reaction of labour, especially organised labour, to scientific management has had interesting phases. Generally where individual plants have undertaken to modify their managerial methods in accordance with the doctrine, the workers concerned have been at first indifferent, later satisfied, in many instances strongly approving. However, following the Eastern Rate Case hearings in 1910, the administrative headquarters of the American Federation of Labor declared strongly against the doctrine as well as against elements of Taylor's system. The political influence of organised labour led to Federal legislation prohibiting stop-watch time study and the use of standards of performance and of remuneration, derived by time study, in arsenals and other government enterprises. This attitude of organised labour was caused by a many-sided fear of scientific management; that intensive investigation and standardisation of operating conditions and methods would break down whatever monopoly there might be in labour's special knowledge of craft skill, that wage payments in accordance with measured individual performance would break down uniform craft rates of remuneration established by labour organisations, that control of work through planning and the assignment of tasks would permit such a speeding up of operations as to impair the workers' health, and in general that these and other elements would put management in a stronger position to resist the increasing influence of organised labour.

The opposition of organised labour has gradually diminished, because labour is conscious of greater strength and security since the World War; because its observations have established the fundamental facts that scientific management's investigations include the problem of human relations in industry and disclose the technical necessity of workers' good will; and because therefore proponents of scientific management are by circumstances led toward sympathetic understanding of labour's problems.

*Influence Outside the United States.*—Notwithstanding the translation of Taylor's *Principles of Scientific Management* into 10 languages, the influence of scientific management outside the United States has been moderate. This is due in large measure to inhibitive mental attitudes derived from experience under different physical and social conditions of industry, and in no small measure to the fact that the meagre translated literature has not been supplemented by concrete illustrations in practice. In the United States concrete illustrations were in existence before the doctrine was formulated and published; in other countries the doctrine has been published without illustrations in practice. This has resulted in a marked difference in understanding and in influence. In western Europe the literature of discussion gives evidence of understanding of the mechanical aspects of the essential technique, but not, with certain noteworthy exceptions, particularly in France, of scientific management's advanced views concerning human relations. The literature of discussion in eastern Europe gives evidence of the fundamental misconception that scientific management connotes merely the utilisation of the various sciences in industry, and not, what is its outstanding characteristic, the development of a science of managing the elements brought together in enterprise.

**SCOPOLAMINE.**—Scopolamine or hyoscine is a complex alkaloid closely related to atropine and having the chemical formula  $C_{17}H_{21}NO_4$ . It is laevorotary to polarised light but in its commercial form may be mixed with its dextrorotary isomer. Scopolamine occurs in varying proportions and is extracted from deadly nightshade, henbane, thornapple and a few other less-known plants. Hyoscine hydrobromide, the official preparation of the British Pharmacopoeia, consists of transparent colourless crystals which have a bitter taste, are soluble in water and have the formula  $C_{17}H_{21}NO_4HBr \cdot H_2O$ . The therapeutic dose is  $\frac{1}{100}$  to  $\frac{1}{10}$  grain.

**Action.**—The chief action of scopolamine is hypnotic, a condition very similar to natural sleep being induced. This usually lasts for about six hours and the patient wakes up with an unclouded mind but may complain of thirst and dryness of the mouth and throat. In some cases a stage of excitement, giddiness and incoherent speech may precede that of sleep, and it is this uncertainty of action which renders the drug somewhat unreliable. A certain degree of tolerance is produced after prolonged exhibition of scopolamine so that the dose has to be increased to have the same effect.

**Administration.**—Scopolamine by itself does not relieve pain, so that for anaesthetic purposes it is usually combined with morphia. Some such mixture as:—Morphine gr.  $\frac{1}{4}$ , Scopolamine gr.  $\frac{1}{100}$ , is injected hypodermically, the scopolamine being repeated as necessary in doses of gr.  $\frac{1}{400}$ . This "twilight sleep" method does not produce surgical anaesthesia, but has the double action of dulling pain and producing loss of memory. It is thus useful in labour, especially when the process is likely to be prolonged, as in primiparae. In these cases the initial dose should be given when the first stage is well established. The patient should then fall into a somnolent condition from which she is partially roused when each pain occurs. To obtain the best effect, the patient's ears should be plugged with cotton wool, her eyes bandaged, and the room kept perfectly quiet. The chief disadvantage in the "twilight sleep" method in labour is that the child may be born in an apnoeic condition and a considerable time may elapse before regular respiration is established. If skilled attention is available, however, it is rare for the baby to suffer any ill effects. The action of the drug upon the foetal heart appears to be negligible. If forceps have to be applied or any other form of instrumental delivery is necessary, an inhalation anaesthesia will have to be administered in addition.

"Twilight sleep" can also be used as a preliminary to the various types of regional analgesia. For instance, a severe operation can be performed under preliminary morphine-scopolamine injection and subsequent spinal analgesia without the patient being aware that he has been moved out of bed.

Some anaesthetists also use the drugs as a preliminary to general anaesthesia, such as nitrous oxide-oxygen. This method undoubtedly lessens the apprehension of a nervous patient and has the advantage that less general anaesthetic is necessary, but it tends to depress respiration so that cyanosis and a difficult administration may ensue. The breathing may in fact become so shallow that the requisite depth of anaesthesia may be impossible to attain. The blood pressure also tends to fall, while the eye and other reflex signs which are useful in estimating the depth of anaesthesia can no longer be trusted.

Again, scopolamine-morphine is definitely contra-indicated in children, in severe abdominal operations and in cases of intestinal obstruction, as the drugs may tend to increase the paralysis of

the gut. Furthermore, it should not be given to patients who are known to have an idiosyncrasy for either of its constituents. For these reasons, scopolamine-morphine should not be used as a routine preliminary injection but should be reserved for selected cases.

**SCOTLAND** (see 24.412).—The history of Scotland from 1910 to 1925, apart from an important ecclesiastical movement, to which reference will be made later, resolves itself largely into the effect of the World War, and of the conclusion of peace, upon social, industrial and political conditions. For matters that affect Scotland as a part of Great Britain, the article GREAT BRITAIN should be consulted.

By the military operations of the War Scotland was affected only to a small extent; Zeppelins attacked Edinburgh and did considerable damage on April 2 1916, and there were further raids upon Scotland in May and in Aug., but on both occasions the airships lost their way and dropped their bombs in rural areas. On the other hand, for the first time in the history of Great Britain as a seapower, the main activities of the Fleet were conducted in Scottish waters, from Aug. 1914 to the surrender of the German fleet on Nov. 21 1918. It was in Scapa Flow that the crews of 70 German men-of-war scuttled their ships on June 21 1920. An incident of the naval warfare was the bombardment of the remote island of St. Kilda on May 15 1918, when damage was done to the church and some other buildings. The part played by Scotland in supplying man-power, and in providing munitions of war, was worthy of the national tradition; the Clyde, naturally, took the chief part in naval construction and repairs, but all over Scotland munition factories came into existence—the largest was built at Gretna in 1915.

**Politics.**—Since the conclusion of the War a great change has occurred in the political complexion of the country. The Representation of the People Act (1918) increased the number of voters from 800,448 at the general election of Dec. 1910 to 2,211,178 at the general election of Dec. 1918. It also severed the last link with the old tradition of Scottish parliamentary representation by its redistribution of constituencies; the shire ceased to be the unit of county representation, and the old Scottish system of the separate representation of groups of burghs was almost entirely abandoned. With the change in the electorate came a break in the traditional fidelity of the Scottish constituencies to the Liberal party. In Dec. 1910, Scotland returned 58 Liberal, 11 Conservative and three Labour members; in 1918, when a proportion of Liberals supported the Coalition Govt., there were 58 Coalition, seven Labour, seven Liberal and two Independent members. After the break-up of the Coalition, in the autumn of 1922, the Liberal representation was 28, against 29 Labour and 15 Unionist members. In 1923 the Liberals were reduced to 22, and in 1924 to nine; the Labour members were increased to 35 in 1923 but fell to 24 in 1924; the Conservatives held 16 seats in 1923 and 40 in 1924. One Independent, with a leaning to Labour, was returned at each election, and in 1922 an avowed Communist was elected for the Motherwell division of Lanarkshire.

**Land and Temperance Legislation.**—The social life of the country was affected by a number of important legislative enactments, most of which were passed immediately after the War. With regard to land tenure, a considerable change has been made by the Small Landholders (Scotland) Act of 1911, by which the Scottish Land Court (which among other duties decides upon applications for small holdings and fixes fair rents) was constituted, the earlier Crofters Acts were extended and amended, and a Scottish Board of Agriculture was created. Further provision for the acquisition of land for small holdings was made by the Land Settlement (Scotland) Act of 1919, which widened the range of activities of the Board of Agriculture.

A pre-War measure which came into operation in 1920 was the Temperance (Scotland) Act of 1913, which provided that

local authorities, on the receipt of signed requisitions from electors in their areas, should take a poll on three alternative resolutions dealing with the number of licences in an area, viz., (1) that there should be no change in the system of licensing, (2) that the licensing court should grant not more than 75% of the licences previously in existence and (3) that all licences in the area should be withdrawn, except, in special circumstances, to *bona fide* hotel and restaurant keepers, who might be allowed to sell drink to residents in hotels or to persons taking meals at restaurants. The areas were defined as burghs of a population not exceeding 25,000; separate wards in larger burghs; and parishes in the counties and the voters as electors to town councils in burghs and to parish councils in the counties. A no-licence resolution requires 55% of the recorded votes in a poll of not less than 35% of the electors in order to be carried; a limitation of licences requires only a bare majority vote in a similar poll, and where a no-licence resolution is not carried the votes given for no-licence are added to those given for limitation. Polls were held in Nov. and Dec. 1920, in 580 out of 1,221 polling areas; in about 300 of the remaining areas no licence existed. Five hundred and nine areas voted for no change, 35 for limitation of licence and 40 for no licence. The contest of 1920 was fought by the Temperance party upon a prohibition programme, and the result was rather a repudiation of prohibition than an indication of satisfaction with existing licensing conditions. Subsequent polls, taken on requisitions made in accordance with the Act of 1913, have not seriously modified the results ascertained in 1920, and it has been generally felt that the Act requires amendment, especially in the definition of an "area" as a single ward in the larger burghs, which must be treated as a whole in order to render possible a more equal distribution in any reduction of licences; in Glasgow the withdrawals of licences after the polls of 1920 were chiefly in middle-class residential districts.

**Education.**—Just after the close of the War the machinery of the system of education was reorganised, with a large increase of expenditure, both national and local. The English Education Act of 1918 marks an era in State provision for education, and the Education (Scotland) Act which accompanied it swept away the system of parochial or burghal school boards created in 1872. Five large burghs, Edinburgh, Glasgow, Aberdeen, Dundee and Leith, remained separate educational areas (the number was reduced to four by the amalgamation of Leith with Edinburgh in 1920); elsewhere the area is the county, including the burghs within its bounds. Electors to the administrative bodies (known as Education Authorities) are persons registered as local government electors, and voting is conducted on the principle of proportional representation. Education authorities are empowered to expend money on the provision of food and books for the children, and also to give assistance to qualified persons attending a university or training college. The maintenance of a limited number of fee-paying schools is permitted. Nearly all the pre-existing voluntary or denominational schools have been transferred to education authorities in accordance with a provision of the Act; the teachers in such schools are appointed by the local authority after being approved, as regards character and religious belief, by the denomination concerned. The Act contemplated an extension of the school age to 15 years and the provision of an elaborate system of continuation schools, but its provisions have only been partially carried out. Contemporaneously with these developments in elementary and secondary education, the Treasury grant to the universities was largely increased, and, since the end of the War, private benefactions have greatly improved the teaching equipment of all four universities, and especially Glasgow and Edinburgh.

**Housing.**—The depression in trade and commerce which followed the unproductive activity of the War period and the short post-War "boom" has deeply affected Scotland, and the "heavy" industries in the Clyde valley, and in the Glasgow area generally, have suffered very severely. It is in this area that difficulties in regard to housing have been most severely felt, and the housing problem and the operation of the various Rent

Restriction Acts, have been complicated by a series of unfortunate incidents. A decision in the Scottish Law Courts, in the case of *Kerr v. Bryde*, upheld on appeal to the House of Lords in Nov. 1922, invalidated notices of increase of rent under the Rent Restriction Act of 1920, unless actual notice to quit had been given to the tenant for the date on which the increase was to operate. This decision, interpreting a carelessly drafted statute, placed many owners of houses, chiefly among the poorer classes, in a very difficult position, and also affected the collection of local rates which had been levied on the increased valuation. In Jan. 1924 the eviction of the defender in this case from a tenement in the burgh of Clydebank was followed by a "rent-strike," which produced considerable embarrassment not only to landlords and factors but also to the municipal authorities and the Scottish Office. An intervention by Mr. Adamson, the Secretary for Scotland in the Labour Govt., was unsuccessful, and the struggle, in the course of which eviction scenes caused great local excitement, was not terminated until 1925. An effect of the controversy was to check any private building, and the housing schemes of local authorities have been hampered by trade union disputes and by a scarcity of bricklayers, masons and plasterers. The Royal Commission on Housing estimated the shortage of houses in Scotland in 1917 at over 121,000; official figures show that up to Oct. 1925, only 34,639 houses had been built, and 12,791 were in process of construction, in Scotland, under the Housing Acts of 1919, 1923 and 1924. The failure of Scottish local authorities to solve the housing problem led to Government intervention at the end of 1925.

A reflection on the condition of trade, and possibly of housing, is to be found in the report of the Registrar-General for Scotland for 1923, which estimated the population in the middle of that year at 4,901,100, a decrease of 3,356 upon the estimate of the previous year, though an increase of 18,603 over the figures of the 1921 census. This decrease, a novel feature in statistics of the population of Scotland, is attributed to emigration, the number of emigrants in 1923 showing an excess of 52,345 over the number of immigrants.

**Presbyterian Reunion.**—A main feature of national interest since the War has been the development of negotiations for a union of the Church of Scotland with the United Free Church; the latter is itself the result of a union between the Free Church and the United Presbyterian Church in 1900. With a view to the reunion of the two great branches of Scottish Presbyterianism, the Church of Scotland obtained in 1921 an Act of Parliament the effect of which was to transform the relations of the Church with the State, and to give the Church liberty both "to adjudicate finally in all matters of doctrine, worship, government and discipline," and to interpret and modify (within the limits of Trinitarian Protestantism) the Articles of the Constitution, which were scheduled in the Act. This legislation removed the difficulties, of historical origin, that led to the Disruption of 1843, but it was felt that the system of endowment also required a readjustment, after the lapse of nearly three centuries since the settlement made in the reign of Charles I. In April 1922 a departmental committee was appointed by the Secretary for Scotland, with Viscount Haldane as chairman, and it made recommendations most of which were embodied in the Church of Scotland (Property and Endowments) Act, 1925.

By that measure the system of endowment has been altered, subject to a reservation of the life interests of existing ministers. Each parochial stipend, which had hitherto been paid by the heritors or proprietors to the minister of a parish, the amount varying with the prices of agricultural produce each year, will become a fixed charge upon the land, payable not to the minister of a parish, but to the general trustees of the Church of Scotland, and the trustees may arrange for the redemption of the charge by the heritor. Redemption, by payment either of one capital sum or of instalments spread over eighteen years, will be compulsory upon all heritors liable to an annual charge exceeding one shilling and not exceeding one pound; liability for an annual payment of one shilling or less will be extinguished. In the past it has been customary in parishes (numbering about 360 out of

884) in which the whole teind had never been assigned in payment of stipend, for ministers to make from time to time applications for augmentation of stipend from the "free" or surplus teinds, and such applications were heard and decided by judges of the Court of Session sitting in the Court of Teinds. This process will now come to an end, but one final application, within eleven years of the passing of the Act, may be made in the case of each parish, and, if it is upheld by the court, the resulting augmentation will follow a scale laid down in the Act.

A further important change is effected by the Act in regard to upkeep of parish churches and manse, a burden which has hitherto been borne by the heritors. They will now be required to put churches and manse into a reasonable state of repair (if necessary), and to hand them over to the general trustees of the Church, who will be responsible for all future repairs. Glebes will also become the property of the trustees, but churchyards will be transferred to the parish councils. After the extinction of existing vested rights, the revenue received by the general trustees as representing any particular parish will be applied in the first place to meeting the requirements of that parish, but the General Assembly of the Church will have power to decide upon such requirements and to transfer any surplus to a fund which will be at the disposal of the Assembly. A body of Scottish ecclesiastical commissioners has been appointed under the Act to give effect to a number of its provisions, including the transfer of endowments to the general trustees of the Church.

The two Acts of 1921 and 1925 were promoted by the Church of Scotland for the purpose of removing "the main causes keeping the two Churches apart," and while the Act of 1925 was passing through its last stages in Parliament the General Assembly of the United Free Church passed, by a majority, a resolution recognising the progress achieved in this direction, and ordered its presbyteries and congregations to send to the Assembly of 1926 indications of their opinions upon the desirability of union.

An ecclesiastical event of minor importance which aroused widespread interest both in England and Scotland was the appointment, on the recommendation of the Labour Govt., of Mr. James Brown, M.P., as Lord High Commissioner to the General Assembly of the Church of Scotland in 1924, the first instance of the selection of a commoner for this post since 1643. The King and Queen themselves visited Edinburgh in Oct. 1922, when they unveiled the memorial to King Edward at Holyrood, and again in July 1923, when they gave a reception and a garden party in the palace.

*Scottish National Library.*—The year 1925 witnessed the institution of the National Library of Scotland. The Library of the Faculty of Advocates, founded in Edinburgh in the reign of Charles II., was given the copyright privilege by the Copyright Act of Queen Anne, and it became one of the great libraries of the United Kingdom. It was the property of the Faculty of Advocates, which, though its library was open to the public, bore the whole responsibility for maintenance and upkeep. Even before the War this burden was too heavy for a small body of professional men, and the rise in prices after the Armistice rendered it impossible for the Faculty to maintain the library on the old scale and to continue the facilities given to the public. In 1922 the Faculty offered to transfer the library, with the exception of the collection of legal books, to the nation. The Government replied that in the existing state of the national finances it was not possible to accept the proffered gift and to undertake the financial responsibility for the library, but made an annual grant of £2,000 as a contribution towards the cost of upkeep and use. A small endowment trust was formed to raise an endowment sufficient to meet the requirements of the Government with a view to the transfer, and in June 1923, within a few days of the announcement of the creation of the trust, Mr. Alexander Grant (afterwards Sir Alexander Grant, Bart.), intimated a gift of £100,000, the sum stipulated by the Treasury. Negotiations were at once resumed with the Government, whose acceptance of the offer of the library was announced in the House of Commons on June 28. Arrangements for the transfer, and two changes of Government, delayed the passage of a bill which

became in 1925 the National Library of Scotland Act. The library is now administered by a body of trustees, some of whom are *ex officio*, and others are appointed by the Crown or by administrative and educational authorities or are co-opted by the trustees. The books continue meanwhile to be housed in the premises belonging to the Faculty of Advocates, which retains in its own possession its collection of professional law-books, but has included in its gift to the nation such part of its existing premises as is not needed for its own administrative purposes.

*Miscellaneous.*—The most important municipal developments have been the inclusion of the burghs of Govan, Partick, Pollokshaws, and some suburban districts within the city of Glasgow by an Act of 1912, and a further extension of the municipal boundaries of Glasgow by an Act of 1925; the amalgamation of Edinburgh with Leith, and the absorption of the suburban districts of Liberton, Colinton, Corstorphine and Cramond by the city of Edinburgh in 1920; and the amalgamation of Motherwell with Wishaw in 1920. Among miscellaneous matters of interest may be mentioned a series of gifts of historical buildings to the nation—Dryburgh, Abbey by the late Lord Glenconner, and Melrose Abbey by the Duke of Buccleuch in 1918, the farm of Ellisland, in Dumfriesshire (occupied by Robert Burns from 1788 to 1791) and Duddingston Loch, near Edinburgh, in 1923. Kelso Abbey, Restenneth Priory (Forfarshire) and Inchcolm Abbey have also been placed under national custody. On the other hand, by an outrage attributed to women suffragists, Scotland lost, on Feb. 26 1914, the church of Whitekirk (East Lothian), one of the few beautiful pre-Reformation churches. A feature of the period has been the increased number of state visits paid to Scotland. An accession Court was held at Holyrood in 1911, and, except during the War, courts have been held periodically in Edinburgh and visits have been paid to other towns. An awakening interest in Scottish history has been shown by a number of celebrations—the quincentenary of the university of St. Andrews in 1911, the sixcentenary of Bannockburn in 1914, the septcentenary of the burgh of Dumbarton in 1922 and the septcentenaries of the foundation of the cathedrals of Elgin and Dornoch in 1925. An announcement, made by the Prime Minister in Dec. 1925, that the Government intends to restore the office of Secretary for Scotland to the dignity of a Secretaryship of State was a recognition of a Scottish demand which had been persistent for years.

(R. S. R.)

**SCOTT, CHARLES PRESTWICH** (1846– ), British editor and journalist, born at Bath, Somersetshire, on Oct. 26 1846, was the youngest son of Russell Scott. He was educated privately and at Corpus Christi College, Oxford, where he graduated with a first class in 1869. After training under Alexander Russell of *The Scotsman*, he, in 1871, began a long connection with *The Manchester Guardian*, of which his brother-in-law, J. E. Taylor, was proprietor. He himself became editor in 1872, and, after the death of Taylor in 1905, also chief proprietor. He enlisted the services of W. T. Arnold and many of the leading critics of literature, art and music of two generations, so that the paper became one of the foremost journals of the day. Gradually developing from Whiggism to advanced Liberalism, *The Manchester Guardian*, as directed by Mr. Scott, was always sober in tone and scrupulous in policy. It lost nothing by its opposition to the Boer War or its reluctant acceptance of the breach with Germany, and able articles on the strategy of the World War appeared in its columns. The policy of Irish Home Rule was zealously advocated, as well as women's suffrage and proportional representation. After the War a weekly edition and a commercial supplement were instituted. The centenary (1921) of the foundation of the paper was celebrated, not only by the

issue of a special number to which foreign and Dominion statesmen contributed, but by a dinner to the editor attended by eminent men of all political parties. Always active in local politics, after three unsuccessful contests for the representation of North-East Manchester, Mr. Scott was elected Liberal M.P. for the Leigh division of Lancashire in 1895 and sat till 1906.

**SCOTT, SIR GILES GILBERT** (1880- ), British architect, born Nov. 9 1880, was the son of George Gilbert Scott and grandson of Sir George Gilbert Scott, R.A. Educated at Beaumont College, Old Windsor, he began to practice in London in 1902. In the following year his designs for the projected cathedral at Liverpool were accepted, but, in consideration of his youth, G. F. Bodley, R.A. was associated with him as joint architect. In July 1904 the foundation was laid by King Edward, the corner stone of the chapter-house by the Duke of Connaught in 1906, and the Lady Chapel was completed in 1910. After some delay occasioned by the World War, the consecration took place on July 19 1924, in the presence of King George V. and Queen Mary. Designed in Gothic style it was the first Anglican cathedral built in the northern provinces since the Reformation, and when completed, will be the largest church in Great Britain. The exterior is of red sandstone and the building is specially adapted for lighting by electricity. Chief among the other works of the architect are the Church of the Annunciation, Bournemouth; St. Manghold's Church and Presbytery, Ramsey, Isle of Man; the Chapel of the Visitation Convent, Harrow; and new buildings at Clare College Cambridge. Scott also did restoration work on Chester Cathedral. He was elected A.R.A. in 1918, R.A. in 1922, and was president of the Architectural Association in 1920-1. He was knighted after the consecration of Liverpool Cathedral in 1924. (See ARCHITECTURE.)

**SCOTT, SIR PERCY MORETON** (1853-1924), British sailor, was born July 10 1853. He entered the navy in 1866 and served in the Ashantee War 1873-4, the Congo Expedition 1875 and in the Egyptian campaign of 1882. In 1893 he was promoted captain and in the following year became a member of the ordnance committee. In 1896 he took command of the cruiser "Scylla" and came into prominence as the inventor of the "dotter" and "deflection teacher" devices, which signified an important advance in the evolution of naval gunnery. He served with the Naval Brigade in the South African War, when he got the naval 6-in. guns up to Ladysmith and in 1900 assisted the International Brigade in China during the Boxer Rebellion. In 1903 he took command of the gunnery school ship "Excellent," in 1905 became rear-admiral and inspector of target practice and in 1908 was promoted vice-admiral. Created K.C.B. in 1910 in recognition of his services, he was made a baronet in 1913 and retired in March of the same year with the rank of admiral. On the outbreak of the World War he returned to the service and was for some time in charge of the air force defences of London. Sir Percy Scott later became an advocate of the submarine, and was strongly opposed to the building of battleships. He died Oct. 18 1924. He wrote *Fifty Years in the Royal Navy* (1919).

**SCOTT, ROBERT FALCON** (1868-1912), British sailor and explorer, was born at Devonport June 6 1868. Entering the navy in 1882, he became a commander in 1900, and led the National Antarctic Expedition in 1901-4 (see 21.966). On his return he was promoted captain, and commanded successively the "Victorious," the "Essex" and the "Bulwark." In 1910 he set out in command of another expedition to the Antarctic (see POLAR EXPLORATION). A party of five under Scott reached the Pole on Jan. 18 1912, but on the return journey the severity of the weather prevented them from reaching supplies at One Ton depot with the result that they perished on or about March 27 1912. On Nov. 12 1912 a search party found Scott's tent, containing the bodies of Scott, Dr. E. A. Wilson and Lt. H. R. Bowers, as well as Scott's records and diaries, in which was given a full account of the journey and the deaths of Captain Oates and Petty Officer Edgar Evans, the other two members of the party. On Feb. 14 1913 a memorial service was held in St. Paul's Cathedral, London, and a Mansion House fund was subsequently

raised to make provision for the surviving relatives of the lost explorers. The rank and precedence of the wife of a K.C.B. were by royal warrant conferred on Captain Scott's widow.

**SCOTTISH-GAELIC LITERATURE** (see 5.635).—In the period 1910-25 the literary use of Scottish Gaelic probably increased. A greater respect for the language, greater desire to become proficient in it and to use it both in speech and in writing were apparent. Among the reasons for this were the continuous activity of An Comunn Gàidhealach, the position which Gaelic now occupies in the universities and in the leaving certificate examination for secondary schools, and above all the clause in the Education Act of 1918, which enjoins that Gaelic shall be taught in all schools throughout the area in which the language is spoken.

Two new forms were attempted with considerable success, the novel and the play. Examples of the former are John MacCormick's clearly written tale of *Dùn Aluinn* (1912), Angus Robertson's *Antogha Mór* (1913), episodic but vigorous, and James MacLeod's *Cailín Sgiathanach* (1923), a thoughtful and well-constructed romance. The authors are Islesmen. The most notable of the plays are perhaps *Màiread* by Archibald MacCulloch, and *Raih-innis* by John MacCormick.

*The MacDonald Collection of Gaelic Poetry* (1911), edited by Rev. Archibald MacDonald and Rev. Angus MacDonald, contains many pieces hitherto unpublished, some of which are of great merit. A volume of contemporary poetry, entitled *Bardachd Leòdhais* (1916) by natives of Lewis was edited by Ian N. MacLeod; another Lewisman, Murdo Morrison, produced his work under the title of *Fear Siubhal nan Gleann* (1924). In 1688 and following years Duncan Macrae of Inverinyate in Kintail made a MS. collection of poetry, some of it by himself, known as the *Fernaig Manuscript*, written on a phonetic system of his own. Most of it has been dealt with by various scholars from time to time, and in 1923 Malcolm Macfarlane published a complete revised text together with a fairly successful rendering into ordinary spelling. Fifteen poems addressed to Gaelic nobles from the phonetically spelled *Book of the Dean of Lismore* (c. 1530) appeared in *An Gàidheal*, restored by Prof. W. J. Watson, who also edited *Specimens of Gaelic Poetry, 1550 to 1900* (1918) and *Specimens of Gaelic Prose, c. 1000 to 1910* (1915).

During the World War 19 booklets for the use of British Gaelic-speaking soldiers were issued by the Scottish Churches under the editorship of Rev. Malcolm MacLennan and Prof. Donald Maclean, and were much sought after and appreciated. Among new editions may be named the *Songs of Duncan Macintyre* (1912), edited with translation by G. Calder, the *Spiritual Songs of Dugald Buchanan* (1913), edited by Prof. Donald Maclean, and the *Poems of Alexander MacDonald* (1924), edited with translation by the editors of the *MacDonald Collection*.

Mrs. K. W. Grant's *Aig Tigh na Beinne* (1911) is a collection of short stories and sketches. The Hon. R. Erskine edited three volumes of *An Rosamach* (1917, 1918, 1921) consisting of poems and essays by living writers. Iain Moffatt-Pender's *Mo Nighean Donn Bhòidheach* (1924) is a collection of sketches, including an account of a walking tour on the West Coast, remarkable as being written by a man who has learned to speak and write Gaelic within recent years. Messrs. Blackie & Son published, under the general editorship of Prof. W. J. Watson, a finely produced series of school readers, six in all, of which the prose part is specially written.

*An Gàidheal*, formerly *An Deo-Grèine*, the monthly magazine of An Comunn Gàidhealach, included many Gaelic articles and essays which obtained prizes at the annual Mòd. The monthly magazines of the Presbyterian Churches have Gaelic supplements, and while all are good, the supplement to *Life and Work*, edited and written by Rev. Donald Lamont, is of quite outstanding literary merit. Gaelic articles form part of the *Transactions* of the Gaelic Society of Inverness, which in 1925 had produced 30 volumes of valuable matter. It is unfortunate for scholarship that the *Celtic Review* ceased during the World War and was not revived. Its 10 volumes included, among much else of value, the text and translation by Prof. Mackinnon of the

*Glenmasan Manuscript* and of the Gaelic version of the *Thebaid of Stathius*. Miss Frances Tolmie gave to *The Journal of the Folk-Song Society* (No. 16) 105 songs of Occupation from the Western Isles, forming a most important contribution towards the preservation of our traditional music and poetry. Mrs. Kennedy-Fraser and Rev. Kenneth Macleod published three volumes of *Songs of the Hebrides*.

Alexander Macbain's studies in *Place Names, Highlands and Islands of Scotland* (1922) were collected in one volume edited by Prof. W. J. Watson. A. R. Forbes's *Place Names of Skye and Adjacent Isles*, though of far less authority, contains much useful information. A most useful dictionary in three volumes, containing the gist of all previous dictionaries, together with new material, was completed in 1911 by E. MacDonald (E. Dwelly), who not only compiled the book but also printed it with his own hands. In 1925 a serviceable *Pronouncing and Etymological Dictionary*, containing Gaelic-English and English-Gaelic, was produced by Rev. Malcolm MacLennan. A list of books printed in the Gaelic of Scotland, entitled *Typographia Scoto-Gadelica*, appeared in 1915, compiled by Rev. Donald Maclean. A. O. Anderson's two volumes of *Early Sources of Scottish History A. D. 500 to 1286* (1922) is a learned and indeed monumental work of over 1,450 pp. of text and 105 pp. of index, a work which, though not in Gaelic, was possible only for a competent Gaelic scholar. (W. J. W.)

SCRANTON, Pa., U.S.A. (see 24.476), "the anthracite capital," had a population of 137,783 in 1920, of whom 28,568 were foreign born; and 142,266 in 1925 (census bureau estimate). Russians and Lithuanians, Italians and Poles had become more numerous in the mines and in the general population than the Germans, Welsh and English who predominated in earlier days; and diversified industries had developed until the number of wage-earners in factories was larger than the number of coal-miners. The leading manufactures of the district were silk, lace, lace curtains, buttons (3,000,000 a day), phonograph records, hydraulic machinery, cotton and woollen fabrics, mining machinery and heavy hardware. The output of the establishments within the city was valued at \$26,365,000 in 1909; \$54,630,000 in 1919; \$64,169,077 in 1923. Anthracite mining, however, was still the dominating industry: coal-mine operatives were a fifth of all persons engaged in gainful occupations in 1920; breakers, culm piles and surface subsidence were visible evidence of the work underground; and whenever a long suspension or strike occurred, as in 1912, 1922 and 1925 it affected seriously the whole economic fabric of the city.

SCRIABIN, ALEXANDER NICHOLAEVICH (1871-1915), Russian composer, was born at Moscow on Christmas day 1871 (O.S.). His father was a lawyer; his mother, a good pianist and pupil of Leschetitzky, died when he was one year of age. His schooling was received in the Moscow Cadet Corps, but he never showed any liking for the military career for which he was intended, and at 18 entered the Moscow Conservatory of Music where he was a pupil of Safanov and Tanier. On leaving the conservatory Scriabin was greatly helped by the patriotic music publisher Belyayev, who brought out his earlier works and arranged a European piano recital tour for him. At 20 he returned to Moscow and joined the conservatory staff. Later he again travelled, this time for six years, visiting the United States amongst other countries. He then settled in Brussels for some time, and in 1910 returned to Moscow. In 1914 Scriabin visited England, giving two piano recitals, playing his own Concerto and appearing as pianist in his *Prometheus*. He was then suffering from a tumour of the lip, from which, soon after his return, he died, April 14 1915.

As a composer Scriabin represents what may be called the classical school carried forward to its most advanced point. The form of his sonata and symphony movements he derives from Mozart, through Beethoven; however bewildering these may at first sound, they will be found, on a second or third hearing, to be laid out on essentially the Mozart-Beethoven lines. In his pianistic idiom and general pianistic qualities of style, Scriabin derives largely from Chopin, of whose work he was a great admirer. All this then indicates a conservative side to his composition, but he was more radical in his

harmonies, and it was, probably, largely the novelty of these that retarded appreciation of his later works. Gradually he evolved what may be called a new scale or, from another point of view, a new chord. It consists of the upper partials of the fourth octave from the fundamental note, less two (taking C as the fundamental note—C, D, E, F♯, A, B♭ or, arranged as a superposition of fourths, as Scriabin most frequently uses them, C, F♯, B♭, E, A, D). The hint of this new harmonic scheme may be seen in the earliest compositions, and its development was fairly regular and consistent, until it came to dominate his later output. In his later works he discards entirely the old key signatures. In his orchestration Scriabin calls for a large force, and uses it very freely: his scores are excessively contrapuntal in texture, the various instruments moving very independently and weaving together their respective themes: muted brass plays a large part in his orchestral colour scheme. In the First Symphony a chorus is used in the finale; the "Poem of Fire" also uses a chorus, but in an orchestral way, no words being supplied. For the last-named work the composer also wrote an optional part for a "Tastiera per luce," or keyboard of light, the intention being that varying colours should play upon a screen as the work was being performed. The composer was greatly interested in theories as to a correspondence between the musical scale and the scale of colours. In his great *Mystery* (left unfinished at his death) music, dance, speech, perfume and colour were to be combined; this work was to be rather a work of ritual than of art, and was to express its author's idealistic mysticism through the medium of 2,000 participants.

It is usual to look upon Scriabin's musical work as largely the expression of theosophical views, and undoubtedly much of his inspiration was drawn from the works of Blavatsky and others. He was not, however, a close reader, or a careful thinker. Seizing the main idea of a book or a creed, he would neglect the details, and the imagination would quickly develop a huge scheme of thought having little relation to what he had read. The titles of many of his works and of their separate parts, and the marks of expression affixed to particular passages, indicate plainly the existence of a spiritual "programme." The emancipation of the human soul through ceaseless striving, and its achievement of self-expression, may be said, very roughly, to represent the general sense of the spiritual basis of Scriabin's musical works.

The works of Scriabin have been variously classed into periods. A logical classification is into four periods as follows: 1st period, with a strong Chopin influence; the dividing line between this and the 2nd period runs through the First Symphony, and the 2nd period shows some Wagner and Liszt influences; the dividing line between this and the 3rd period runs through the Fifth Sonata, and a 4th period begins with the "Poem of Fire."

Works.—Orchestral: *Revery* (op. 24); *Symph. I.* (26); *Symph. II.* (29); *Symph. III.*, or *Divine Poem* (43); *Symph. IV.* (54); *Prometheus*, or "Poem of Fire" (60). Piano: *Sonatas I.* (op. 6); *II.* (19); *III.* (23); *IV.* (30); *V.* (53); *VI.* (62); *VII.* (64); *VIII.* (66); *IX.* (68); *X.* (70). A very large number of preludes, études, impromptus, mazurkas, poems, etc., including the great "Vers la Flamme" poem and the much-discussed last work, the *Five Preludes* (op. 74). Piano and Orchestra: *Concerto* (op. 20). No songs or chamber music are included in Scriabin's output. (P. A. S.)

SCRIPPS, EDWARD WYLLIS (1854-1926), American newspaper publisher, was born at Rushville, Ill., June 18 1854. He was brought up on a farm in Winchester Co., O., and in 1872 joined the staff of the *Detroit Evening News*, of which he became city editor in 1875. Three years later he founded the *Cleveland Penny Press*, which under his direction achieved immediate success. He gradually acquired other journals in Ohio and elsewhere, which later became known as the Scripps-Howard group. In 1896 he, in conjunction with M. A. McRae, formed the Scripps-McRae Press Assn. for the purpose of providing his various papers with cable news. He also, in 1901, organised the Newspaper Enterprise Assn., with the object of supplying features to local papers. In 1908 the Scripps-McRae Assn. was merged with the Publishers' Press Assn. and the Pacific Coast Press Assn. under the name of the United Press Assn., Mr. Scripps holding a controlling interest. In 1917 his health broke down under the strain of war work and in 1920 he retired from business activity. In 1924 he transferred control of his various interests to his son Robert P. Scripps. He died on board his yacht in Monrovia Bay, Liberia, W. Africa, March 12 1926, having spent the last four years of his life in cruising around the world.

SCULPTURE (see 24.488).—In the years immediately preceding the World War Rodin remained the dominant influence in all schools of sculpture, although by then all his most vital works had been created. However posterity may judge him, it must at least see in him the beginnings of the spirit of revolt against academic art, which is the distinguishing feature of this

period and which had made the rebirth of the craft possible. Rodin himself was not free from the curse which was to a great extent responsible for the decline of sculpture—the use of the full-scale model from which skilled masons or bronze founders produced the finished work. But the passionate emotions of his figures prepared the world for a type in which the presentation of beauty is not necessarily the aim of the artist; and the controversies which centred around the “Age of Bronze” and the “Balzac” showed that sculpture was becoming an art to be reckoned with and not one concerned chiefly with official monuments and the graveyard. The revolt became partly a matter of technique, and the younger artists recognised that only by working in their material themselves could they hope to approach the living art of the great periods of sculpture.

These earlier years were the period of the Vorticists in England, the Post-Impressionists in France and the Futurists in Italy—societies which stated their views with exaggeration—a form of propaganda now generally recognised. Their members were neither madmen nor inefficient artists, but searchers after an art the secret of which had been lost. Their experiments led them into all manner of odd by-ways, but they remained true sculptors, if at times their intentions are difficult to understand, and they have originated a type of sculpture which may ultimately be of considerable importance in the history of art.

### I. GREAT BRITAIN

*Epstein and Gaudier-Brzeska.*—Developments in sculpture in Great Britain since 1910 begin with the work of two foreign artists, the American-born Epstein and the Frenchman Gaudier-Brzeska. Jacob Epstein (*q.v.*) came into general notice in 1908 with his masterly series of figures on the British Medical Assn. building in the Strand. These figures, with their close affinity to archaic Greek art and their essentially sculptural qualities, were followed by a number of experiments in abstract art conceived under the influence of the Vorticist movement, such as the marble group “Two Doves” (1913) and the marble figure of Venus (1914) with its broad planes and monumental structure—one of the most important pieces of sculpture of recent times. The bronze “Christ” (1917-9) foreshadows in its rugged surfaces and intense power of characterisation the long series of bronze portraits of his later period, of which the bust of Lord Fisher in the Imperial War Museum is typical. The much-discussed panel of Rima in the Hudson memorial in Hyde Park is a fine example of the sculptor's direct stone-cutting and extraordinary feeling for form.

Henri Gaudier-Brzeska (b. 1891, killed in France 1915), worked almost exclusively in this country. From his intimate connections with the Vorticists he may be considered as an English artist. Among his expressionist works are “The Dancer,” a crouching figure in brown varnished stone, “The Singer” in stone, “The Embracers” (1912-3) in marble and the marble “Seated Figure” (1914)—almost his last work. Three of his more naturalistic figures are in the Victoria and Albert Museum. Eric Gill studied at the Chichester school of art. His early works were exhibited at the Chenil Galleries in 1911, and others have been shown at the Goupil and other galleries in London. His most important commissions have been the low relief “Stations of the Cross” (1914-8) in Westminster Cathedral and a second series in the cathedral at Bradford (1921). The majority of his works, of which the “Boxers” (1913) is typical, are examples of direct stone-cutting. He has also made war memorials for Bryantspiddle in Dorset, Chirk in North Wales (1920) and Leeds University (“The Money Changers”)—the latter an example of his unequalled skill as a designer of beautiful lettering.

Frank Dobson (*q.v.*) owes a great deal of his unusual technical skill and knowledge to his work with the sculptor Reynolds-Stephens and the Cornish granite cutters. His first works, of which “The Concertina Man” (1919) and “The Man Child” (1921) are perhaps the most typical, are definitely Cubist in their inspiration. In his later sculpture, such as the figure of “Cambria” and the “Susannah” he has freed himself from the conscious

restraint of these earlier figures and has evolved a style of great charm and real sculptural feeling.

The figures of Laurence Atkinson are of a more advanced type, reaching at times the region of pure abstraction. Alan L. Durrant worked at first almost entirely in ivory. Since 1921 he has carved a number of important works—excellent examples of direct cutting—which include a wood statue of “The Virgin and Child” (1922) for the Dominican Priory, Haverstock Hill, London. Another “direct” worker is Professor Ernest Cole, who has made groups for the London County Council buildings.

*War Memorials.*—Among the many War memorials scattered over the country, the group comprising the memorial to the 24th Div. in Battersea Park (1924) by Eric H. Kennington is of interest. The majority, however, are of a more academic type, and most of the well-known sculptors have contributed typical examples of their art. Very accomplished works, if at times a little tedious, they give a fair idea of sculpture of the official class—no better and no worse than that of other countries. The younger sculptors who have executed memorials are John Angel, the Scottish artists Thomas J. Clapperton and W. Reid Dick, Thomas Mewburn Crook, Richard Reginald Goulden, Charles Sargent Jagger, Leonard Jennings, Leonard Stanford Merrifield, Louis Frederick Roslyn, Newbury A. Trent, F. J. Wilcoxson and Alan G. Wyon. In the Durban memorial, Phoebe and Harold Stabler have made a new departure by the use of glazed terra-cotta applied to a huge granite cenotaph.

### II. THE UNITED STATES

The United States, with its mixed population, has not yet developed a national school of sculpture, and the constant influx of foreign artists, bringing with them their own typical art, makes such a development more difficult. George Grey Barnard, who was strongly influenced by Rodin, may be considered as the first sculptor whose conception of form and feeling for material are in keeping with modernist tendencies. He is chiefly known in England by his massive figure of Abraham Lincoln, which was refused by London in favour of the more florid statue by Saint-Gaudens, but accepted by Manchester. The most ambitious of his works is the series of groups commissioned by his native State of Pennsylvania for the Capitol of Harrisburg. His later work is well shown in the group “Adam and Eve.”

*Paul Manship.*—To a later generation belongs Paul Manship (b. 1885), although his work, modernist at first sight, is strongly infused with classicism. His figures and groups have a superficial charm which it is difficult to criticise, but they have little feeling for sculptural form. His bronze statuette “Little Brother” (1912), his portrait of his infant daughter Pauline (1914) and his “Dancer and Gazelles” (1916) in the Luxembourg, Paris, are most representative of his eclectic style. The same characteristics are to be seen in the work of several other American sculptors, for example Albert Henry Atkins, Leo Friedlander and Carl Paul Jennewein. Gaston Lachaise received his training in Paris and went to America in 1905, working for a time with Manship. In his earlier figures and animal subjects he shows a vivid power of sculptural simplification, although his later model for a heroic figure for the Telephone and Telegraph building in New York misses some of this quality.

The work of Alfeo Faggi is at times strongly reminiscent of that of the Serbian Meštrović, especially in a figure of St. Francis of Assisi. He has made a number of other statues in which there is the same mystic quality, and his portraits point to considerable powers of characterisation. The Russian painter Maurice Sterne also excels in portrait busts. Among the more advanced American sculptors John Mowbray-Clarke has attained a certain sculptural quality by means of the flattening of his planes and Cecil de B. Howard in such works as his group “Afternoon of a Faun” and other figures shows a definite experiment in the search for a new means of expression.

The work of the more conservative sculptors was well illustrated in the exhibition held in New York by the National Sculpture Society in 1923. In the mass it is not essentially different from that produced in England, and the figures of Chester Beach,

FIG. 1. "The Boxers"; Relief, Eric Gill. FIG. 2. "Susannah"; Frank Dobson. FIG. 3. Portrait of the Artist's Mother; I. Meštrović.  
FIG. 4. "Two Natures of Man"; George G. Barnard.

(By permission of: 1. Ernest Benn Ltd. 2 and 3. The Sculptor. 4. Museum of Art, New York.)

FIG. 5. Lord Fisher; J. Epstein. FIG. 6. "Head of a Woman"; A. Maillol. FIG. 7. "Little Brother"; P. Manship (Detroit Museum of Art). FIG. 8. "The Kneeling Woman"; W. Lehmbrück.

(By permission of: Fig. 5. Imperial War Museum, London. Copyright of the sculptor. Fig. 7. The sculptor. Fig. 8. Photo, P. Cassirer, Berlin)

Jo Davidson, Arthur Lee, Malvinia Hoffmann and two artists of English origin, Leonard Craske and John Gregory, fulfil all the canons of academic art. A foreign temperament is discernible in the vigorous work of the Czechoslovak, Albin Polásek. Among the many sculptors of animals are Hunt Diederich, Heinz Warneke (who has carved some admirable figures in brass), Laura Gardin Fraser, Edith Barretto Parsons and Herbert Heseltine (who exhibited in London in 1925). Grace Mott Johnson has made reliefs of animals which have some of the charm of primitive sculpture.

### III. FRANCE

Although Rodin did not die until 1917, his work is eminently that of the 19th century in its treatment of plastic forms. A man of immense genius, he made the rejuvenation of sculpture possible and yet at the same time the very facility of his art rendered this rejuvenation more difficult. In the large collection of his works which he gave to the British nation in 1914, and which is now in the Victoria and Albert Museum the two main aspects of his sculpture are clearly visible. The "Age of Bronze" has the quality of cubical content and repose common to all great work; the "Prodigal Son," in its restlessness and broken outline, is of a type only too frequent in modern art. Much recent sculpture on both sides of the Channel has been influenced by this easier, ephemeral side of Rodin's art—helped by the skilled bronze founders of France.

*Maillol and Bourdelle.*—Aristide Maillol (b. 1861) studied painting at the École des Beaux Arts, coming later under the influence of Gauguin and the Post-Impressionists. By the production of numberless figures of women in various materials he has arrived at a type of static beauty combined with an architectural unity of structure which gives him a foremost place among living sculptors. Rodin's figures are shown at a moment of critical intensity, Maillol's have a restfulness and dignity devoid of all passion. Rodin with his enormous technical skill overstrains his material to capture some fleeting aspect of the emotions; with Maillol the figure and the material grow together and result in an architectural beauty and intelligibility of form closely akin to the monuments of the Egyptians. Among his larger figures the "Pomona" in the Morosoff Museum at Moscow and the dainty "Flora" are typical of the static quality of his art, and even in the works in which movement is involved—such as the well-known relief of "Two Lovers" and his large bronze figure "Action Bound"—the repose and monumental quality are not sacrificed. A few of Maillol's works were shown in the Matisse exhibition at the Leicester Galleries in 1919; among them was his first terra-cotta sketch of a reclining woman for the memorial to Cézanne to be placed in the Garden of the Tuileries. His later works include a war memorial at Banyuls-sur-Mer and a bronze torso exhibited in 1923.

A third artist whose works have had a great influence on modern French sculpture is Emile Antoine Bourdelle (b. 1861 at Montauban). As a young man he became attracted by Rodin, with whom he remained for a number of years. His early work was strongly influenced by his master, but gradually he evolved a more monumental and less emotional style, reminiscent rather of the work of Dalou. His reliefs for Perret's Théâtre des Champs Élysées (1912-3), with their extraordinary fertility of invention and power of design, were a new step in the direction of architectural decoration, paralleled only by Epstein in England and Metzner in Germany. His more recent works are the monument to the Polish poet Mickiewicz (1917), the figure of "The Virgin and Child" (1920-2) erected on the Vosges and the colossal monument to the Argentine general Alvear (1923).

Charles Despiau and Joseph Bernard, in their search for sculptural harmony, may be regarded as followers of Maillol. Despiau has made a number of heads which have at times the quality of Roman portraits or the charm of the Florentine renaissance. Bernard is chiefly known by a number of statuettes and groups, such as his "Girl with a Pitcher" (1912) in the Luxembourg and his "Woman and Child Dancing." Among his sculpture *en taille directe* the marble "Singer" in the Grenoble Museum is a

good example. His larger works include a half-length granite figure "The Prayer," "The Voice," also in granite, in the Lyons Museum, and a monument to Michel Servet.

*The Expressionists.*—With the works of Archipenko, Lipschitz and Brancousi we approach a type of sculpture utterly different from all that had preceded it. It has little or no relation to nature, and must be judged purely from the emotional or aesthetic effect which it has on the spectator. Alexander Archipenko, a Russian, is the greatest exponent of this "expressionist" school. His earlier works, such as the bronze torso of 1909 and his plaster group "Two Women" (1912), have qualities which identify his aims with those of Gaudier-Brzeska in England. His "sculpture-paintings"—uniting form with colour in the manner of Egyptian bas-reliefs, and his "non-being" sculpture, are experiments in purely abstract art which have a strange aesthetic appeal. Other important figures are the marble torso of a woman (1913) in the National Gallery of Berlin and a bronze figure of a woman (1911) in the Rotterdam Museum. Archipenko has had schools in Paris and Berlin and is now settled in New York. With him may be grouped the Russian, Jacques Lipschitz (b. 1891) and Henri Laurens. A typical work by Lipschitz is his panel of "Musical Instruments" (1919).

It is an axiom of modern sculpture that form should be influenced by the material. But many of the most advanced sculptors consider that materials have their own forms and individual characters, and should therefore not be given a resemblance to something that nature has created in another material. This is exemplified in the art of Constantin Brancousi, a Rumanian working in Paris. Three works which were shown at the Chenil Galleries, Chelsea, London, in 1925 were especially noteworthy for their beautiful technical qualities.

### IV. OTHER COUNTRIES

*Germany.*—Although in the 19th century German sculpture had become involved in the morass which had engulfed the art in all European countries, yet the tradition of craftsmanship which had always been the distinguishing feature of German art enabled it to develop, more quickly than in any other country, a modernist style of its own. The earlier lead given by Hildebrand (d. 1921) was eagerly followed by numbers of young artists encouraged by the foundation of the Berlin Sezession in 1899. The colossal "Battle of the Nations" monument at Leipzig, which was completed by the Bohemian, Franz Metzner (1870-1919), in 1912, is a typical development of Hildebrand's theories of architectural sculpture. The influence of Rodin is evident in the early figures of George Kolbe—for example, the "Dancer" (1912) and the Heine monument (1913) at Frankfurt-on-the-Main. His style becomes more formal in his later work, two examples of which, the "Water Nymph" (1920) and the "Portrait of a Russian Girl" (1925), were shown at the 29th exhibition of the International Society held at the Royal Academy in 1925. Maillol, rather than Rodin, is the inspiration in the work of the Swiss Hermann Haller, Ernesto de Fiori (b. 1881, the son of an Italian father and a German mother) and, to a lesser degree, Karl Albiker. The "Kneeling Man" (1921) in the Berlin National Gallery is typical of Haller's work. In the sculpture of De Fiori can be seen the struggle between the southern and northern elements of his mixed parentage. The bronze figures of a "Standing Man" (1917-8) at Hamburg and a "Woman" (1919) at Bremen have a vivid sense of surface modelling superimposed on a construction almost primitive in its starkness. In the "Walking Man" he attacks again the same problem of action so successfully overcome by Rodin in his "St. John the Baptist" 40 years earlier.

Although in point of date a contemporary of these artists, Wilhelm Lehmbruck (1881-1919) shows yet another stage on the road towards the "absolute" sculpture of the present day. In his large "Kneeling Woman" at Berlin (1911), Mannheim and elsewhere, in spite of the elongated and attenuated figures, he has attained great rhythmic beauty of form; in "The Thinker" at Berlin the function of thought has become spiritualised. Among his last works are a monument to the fallen (1915-6) and a seated figure of a naked man now placed on the Ehrenfriedhof

at Duisburg, the sculptor's birthplace. Fritz Huf (b. 1888 at Lucerne), who owes much to his early training as a goldsmith, may be regarded as a follower of Ernesto de Fiori and Lehmbruck. The influence of Maillol is again to be seen in the earlier figure of Bernhard Hoetger (b. 1875), but his later work has many of the characteristics of negro art. The modernist movement is carried further by his pupil Emy Roeder in her series of figures of women—"Puberty" (1918), "The Moorlander" (1919), "Pregnancy" (1919) and her group of "Two Horses" (1919)—and by Milly Steger in her graceful dancing figure "Jephtha's Daughter."

The later works of Herbert Garbe, such as his two groups of "Death" (1919) and his "Eros" (1920), show little of the spirit of Maillol which imbued his earlier figures, and in his naked man "Upward" the emancipation from classical art is complete. Ernest Barlach works almost entirely in wood, and has carved a number of reliefs and figures of Russian peasants and beggars, which show strong characterisation combined with extraordinary sense of movement. Kurt Edzard has executed many female figures in terra-cotta and bronze showing the influence both of Rodin and Maillol. "The Bather" and the life-sized figure "Nuna," both of 1923, have a strange individual sense of plastic beauty. Among the modern experimenters in the principles of abstract art are Hermann Obrist, Karl Hermann, Oswald Herzog, William Wauer and Rudolf Belling.

*Yugoslavia.*—Ivan Meštrović (q.v.) studied in Vienna, and the influence of the Secession and Metzner is obvious in his work. He obtained universal recognition at the Rome international exhibition in 1911, and later at the war-time exhibition held at the Victoria and Albert Museum in 1915, and his large series of figures in connection with a projected temple at Kosovo seemed to indicate a new force in European sculpture. In all these works, of which the portrait of the artist's mother is a typical example, there is the feeling of seriousness, even depression, so common to the Slav temperament; but the technical skill, depth of religious sentiment and patriotism—which are the keynote of his early work—are undeniable. With the proclamation of Yugoslav unity in 1918 the religious and patriotic influences have become less insistent, and his later works seem to point towards the development of a freer plastic conception.

Toma Rosandić was born at Split (Spalato) in 1878, the son of a marble mason. He studied for two years in Venice, and later worked at Vienna with Meštrović, who exercised a great influence on his art. He exhibited at Zagreb in 1910 and at Rome in 1911, and became known to the British public by his exhibitions at the Grafton Galleries in 1917-8, Edinburgh in 1918 and Brighton in 1919. The majority of his early works were destroyed at Belgrade during the War. An important feature of his later work is the series of large figures cut in wood, in which he shows great technical powers, and a certain charm and sculptural feeling which is at times absent in the work of his more famous compatriot.

*Italy.*—Up to within comparatively recent years the influence of classical art and its derivative, the sculpture of the Renaissance, was paramount in Italy, as may be seen from the groups connected with the colossal Victor Emanuel II. monument (1915) at Rome. The work of the younger men, which is little known in this country, shows the divergent influences of Rodin and the Viennese school, but there are few exponents in "expressionist" sculpture.

Among the more important sculptors of religious subjects are Ermenegildo Luppi (whose "Pietà" was one of the most impressive works in the Rome exhibition of 1921), Corrado Vigni, Guido Calori, Nino Galizzi, Giovanni Manzoni and Libero Andreotti. Andreotti also excels as a portraitist. Amleto Cataldi exhibited a number of works in Paris in 1923, from which his figure "Girl Combing Her Hair" was acquired for the Luxembourg. Adolfo Wildt has made portrait busts with strongly simplified planes, of which that of Mussolini is characteristic; by him is a charming symbolic marble relief of "The Virgin with Three Children." The animal sculptors include Sirio Tofanari, Rembrandt Bugatti and Renato Brozzi. Important works have also been produced by Antonio Maraini and Giuseppe Graziosi (both of whom exhibited extensively in the Venice exhibition of 1924),

Nicola d'Antino, Michele de Benedetti, Attilio Selva, Claudio Botta and L. de Stefanis.

*Belgium.*—Joris Minne (b. 1866 at Ghent) was trained at the Ghent Academy, at Brussels under van der Stappen and at Paris. His early works—such as "The Fountain with Five Kneeling Youths," the "Bricklayer" and the Volders monument—had a mystic idealism and a sculptural feeling which was rare in a world accustomed to the florid realism of Meunier. In his more recent figure of a "Young Man Holding a Shell" and various figures of "The Virgin and Child," the starkness and tendency to abstraction shown in his first works has been modified, with a resultant rhythm which is reminiscent of the figures of Maillol.

A complete contrast to Minne's severe sculpture is that of Rik Wouters (1886-1916), whose early death, one of the tragedies of the War, was a great loss to Belgian art. His work is essentially modern, and is marked by a bold and vigorous execution. Among his portraits, those of the painter James Ensor, "M. H. Elslander" and "Madame G.," are important. Other young sculptors whose work is worthy of mention include Ernest Wynants, who worked with Wouters, Josef Cantré, Oscar Jespers, Dolf Ledel, Schirren, De Kat and Gustave Fontaine.

*The Netherlands.*—An important feature of modern sculpture in the Netherlands is the success with which it has been utilised in architectural decoration and the strongly nationalist art which has been evolved. J. Mendes da Costa and Hendrik Albert van den Eijnde may be regarded as the originators of this style—the latter being more especially concerned with architectural sculpture. Tjipke Visser, J. C. Altorf and L. Bolle—followers of Mendes da Costa—have made some interesting animal studies. Visser has also executed a large number of statuettes and has exhibited at all the European art centres. In his work for the Scheepvaarthuis at Amsterdam (1915-6), for which he made nine granite figures, Van den Eijnde was assisted by Theo van Reijn, who decorated the Polytechnic high school (1921) and other buildings at Delft. Hildo Krop—whose work approaches that of Gaudier-Brzeska more nearly than that of any other Dutch sculptor—and Jan van Lunteren have done important work on public buildings at The Hague and Rotterdam. By the former sculptor are the Albert Hahn monument at Amsterdam (1919) and the marble clock for the Rotterdam Town Hall (1920). Lambertus Zijl also shows in his architectural sculpture the features to be found in the best modern Dutch work—a strong feeling for decorative forms combined with a treatment almost cubist in the simplicity of its planes. Among other sculptors are Johan Raedecker, Herman Frederik Bieling, Bernard Richters, Gijs Jacobs van den Hof, Adrianus Remiëns and Johan Polet.

*Denmark.*—Foremost among the younger sculptors of Denmark is Einar Utzon-Frank, professor of sculpture at the Royal Academy at Copenhagen. Some of his works were included in the exhibition of Danish art held at Brighton in 1912, and a larger selection was shown at the Leicester Galleries in 1924. Most typical of his art are the small bronze figures of women, which recall the work of Joseph Bernard, as also do those of Johannes Bjerg, Mrs. Old Wagner and Willie Wulff. Kai Nielsen has made a number of large groups for Copenhagen. The figures by Svend Rathsack are more academic, and in his figure, "Adam" (1914) he shows considerable sculptural ability. J. P. Dahl-Jensen has modelled a number of animal groups.

**SEALING MACHINE:** see OFFICE APPLIANCES.

**SEAPLANE.**—Seaplanes are types of aircraft capable of arising from or alighting on the water. They may be subdivided into the following classes:—

1. Float seaplanes, in which the landing gear consists of one or more floats or pontoons.
2. Boat seaplanes, in which the central portion consists of a boat providing flotation.
3. Amphibians, which may be of either of the above types but with the addition of a landing gear enabling the aircraft to arise from or alight on the land as well as from the water.

The float seaplane in practically every case consists of a normal land type of aeroplane, in which the landing wheels have been replaced by one or more floats. In many aircraft this has actually been done; for example, in the American flight round the world in 1924 the land chassis was removed and substituted by two floats during the long over-sea flights.

In the smaller types of aircraft up to approximately 10,000 lb. total weight, the float seaplane shows advantages over the boat seaplane, the body, wings, airscrew, etc., may be well clear of the water, a high positive metacentric height can be obtained by suitably spacing two floats, and clean external lines, giving a minimum head resistance, can easily be obtained. The latter point is demonstrated by the fact that the last two "Schneider" Cup Races in 1925 and 1923 were both won by seaplanes of the float type.

In larger types of aircraft, the boat seaplane improves on the float type. As the dimensions of the central hull increase so the seaworthiness of the aircraft is improved beyond that of the twin float type. Again, in the larger types, the hull replacing both the fuselage and landing gear of the float seaplane, there is a considerable saving in weight. This saving in weight in the largest flying boats is sufficient to enable them to compare favourably with land aeroplanes of equal dimensions in regard to structural weight. In normal sized boat or float seaplanes, however, the ratio of structural weight to load carried compares unfavourably with that of land aeroplanes.

The float or hull forms employed are designed to act as hydroplanes when the aircraft is leaving the surface of the water, *i.e.*, that as the speed over the water increases the hydrodynamic forces acting upon the float tend to raise the float, thus reducing its displacement and consequently its resistance. The reduction in water resistance is also enhanced by the use of one or more lateral "steps" on the bottom of the float.

**Resistance.**—As resistance is caused by the water film drawn along by the passage of the float through the water, the step tends to break this water film and replace it by a vortex layer of water and air. These hull and float forms are usually tested by means of small scale models towed in a tank such as the William Froude National Tank at Teddington (London). The forces acting on the model are converted to full scale by multiplying the square of the scale by the square of the corresponding speeds, *i.e.*, by the cube of the scale. As the speed of the hull or float is increased from zero, its resistance at first increases rapidly and then decreases with further increase of speed. The speed at which this maximum resistance occurs is known as the "hump" speed. This hump speed is of the greatest importance in seaplane design. When taking off from the water this speed must be passed through, and, as the air resistance of the wings, body, etc., must be added to the water resistance, the total resistance may be very high.

**Airscrew Design.**—The airscrew must be capable of exerting a thrust at an air speed corresponding to this speed, which is greater than the total resistance of the aircraft at its hump speed, otherwise the speed of the aircraft on the water will never exceed this speed, and the aircraft will be incapable of taking off the

water. To obtain this required thrust, it is often necessary to employ an airscrew which is inferior in efficiency to one designed for flight performance only.

**Stability Problems.**—Longitudinal dynamic stability in boat seaplane hulls is usually obtained by using one main step slightly abaft the centre of gravity of the aircraft and by the addition of a smaller step further aft. This small step is usually only operative when the hull is running at fairly large positive angles, and is intended to neutralise any tendency to pitch or "porpoise" when taking off or alighting. Float seaplanes may be of the "two-float" or "three-float" type. In the two-float type the floats are made long enough to give longitudinal stability when at rest on the water, and when leaving the water the attitude of this aircraft is determined almost entirely by the dynamic characteristics of the floats. In the three-float type, static stability on the water is obtained by the addition of a small float below the tail. In taking off the water the fore and aft inclination of the aircraft is controlled entirely by the pilot by means of the elevating machinery.

Lateral stability at rest in twin-float seaplanes may be obtained by placing the floats sufficiently far apart, but these are usually supplemented by "wing tip" floats, *i.e.*, small floats on the under sides of the lower planes. These wing tip floats only come into operation under exceptional conditions, such as turning on the water in a strong wind. The single-float seaplane, having one large central float assisted by wing-tip floats has very poor lateral stability unless the wing-tip floats are made very large, and this type is now practically extinct.

In boat seaplanes the metacentric height is usually either very small or even negative, and in this case the lateral stability at rest is dependent largely on the wing-tip floats. Certain designers have modified this method of obtaining lateral stability. Dornier, for example, employs two small, rudimentary wings of symmetrical section, projecting from the sides of the hull at the water line, while in the Rohrbach boat seaplane two fairly large floats similar to those of a two-float seaplane are mounted one on either side of the hull. Aerodynamically, the seaplane varies little from the aeroplane. In boat seaplanes the engines and airscrews are situated high above the hull in order that they may be clear of water and spray, the result being that the centre of thrust is above the centre of gravity of the aircraft.

This high position of the centre of thrust above the centre of gravity forms a negative couple, tending to drop the nose of the aircraft when the engines are running, and a boat seaplane in trim for level flight under these conditions would tend to increase its angle of incidence should the engines be stopped. To counteract this change of trim, a negative angle of incidence is given to the tail plane which is often of cambered aerofoil section inverted, *i.e.*, with its convex surface downwards. This tail plane being in the slip stream of the airscrews causes a large negative moment when the engines running, the moment decreasing when the engines are stopped, thus counteracting the change in thrust and centre of gravity couple.

**Modes of Construction.**—Constructionally, hulls and floats have followed wood boat building construction, though in the method of obtaining the necessary strength boat seaplane hulls have developed on two lines. Firstly, the rigid hull, in which the hull is itself strong enough to withstand the impact of striking the water when taking off in a rough sea or alighting; and secondly, the flexible type of hull. In the flexible hull, the impact stresses are absorbed by the elasticity of the hull structure. These hulls are usually of circular section with the "steps" added by forming "double bottoms" for certain longitudinal sections only.

**Use of Metal.**—Lately, the construction of hulls of metal has advanced considerably, duralumin or other aluminium alloy being employed. Steel has not yet been successfully employed for hull construction, as plates of the requisite thickness for lightness and strength yet light enough to complete with the aluminium alloys, would be too thin to withstand any effects of corrosion from salt water or small local impacts. In very large seaplanes of the future it is quite possible that steel hulls may be employed (see AERONAUTICS). (J. C. B.)

**SEA POWER** (*see* 24.548).—Historical lessons could be drawn about sea power from several wars subsequent to those mentioned in the previous article, as, for instance, from the war between Italy and Turkey in 1912, in which, for lack of sea power, Turkey was unable to hold her islands in the Aegean or her territory in North Africa; also from wars in the Balkans. These were all overshadowed by the World War of 1914-8, which afforded examples not only of the great advantages conferred by sea power, but also of its limitations, and of the difficulties in applying it, now that all nations, whether belligerent or neutral, have become so dependent upon each other for economic prosperity, and even for their very existence.

The lessons about sea power that can be learned from a study of the great conflict can best be considered in four main aspects: (1) the facility which it offers or refuses for transport of troops over a worldwide theatre of war; (2) the supply to armies of the sustenance and munitions necessary to their success in land operations; (3) the protection of merchandise, of raw materials, and of food supplies crossing the seas; and, conversely, (4) the power which it confers of exerting economic pressure, especially against industrial nations, and through them upon the fighting forces which they may employ, by sea, land and air, to force matters to an issue.

#### SEA POWER IN THE WORLD WAR

*Central Powers' Disadvantages.*—It will be convenient to deal with the application of sea power in the World War under those four headings. In the first place, however, it must be borne in mind that the Central European Powers (Germany and Austria-Hungary), though favourably situated, on "interior lines," for the most effective use of armies against their opponents, were severely handicapped by geographical conditions in making use of their sea forces in the oceanic theatre of war. Although they possessed strongly defended naval bases, any forces issuing from those bases were confronted with the problem of running the gauntlet, through comparatively narrow waters, past the territory of strong and hostile sea Powers.

Of the German outlying war vessels the fast battle cruiser "Goeben," which had been refitting at Pola in July 1914, passed northward through the Straits of Messina on Aug. 3, and after bombarding Algerian ports early on Aug. 4 (before Great Britain was at war with Germany), turned eastward, coaled at Messina on Aug. 5 and succeeded in reaching the Dardanelles on Aug. 10, evading the strong British and French forces in the Mediterranean. She ultimately furnished an object lesson in the influence of local sea power upon political issues by bombarding, under the Turkish flag, Russian Black Sea ports. The participation of Turkey in the War on the side of the Central Powers put a new complexion upon the conflict, and caused the dispersion of Allied forces, especially British, both by sea and by land.

In more distant stations, the most formidable German vessels were the fast armoured cruisers "Scharnhorst" and "Gneisenau," which, with some light cruisers, were in the Pacific, under Count von Spee. These, for some time unlocated, met and sank off Coronel in Chile on Nov. 4 1914 an inferior and slower force under Sir Christopher Cradock, thus illustrating the need for superior speed in weak sea forces detached upon missions remote from support by the main fleets, a lesson that was put on record by Kempenfelt in the 18th century, when he pointed out that "faster sailers" were the only vessels competent to perform such missions (G. G. Aston, *Sea, Land and Air Strategy*, pp. 132-4). Von Spee's squadron, in its turn, was destroyed by a superior force of battle cruisers under Sir Doveton Sturdee off the Falkland Islands on Dec. 8, thus affording another illustration of the same principle.

Besides the vessels mentioned above, there were also some German light cruisers and armed merchant vessels in distant seas. These were all rounded up by April 1915. Some of these showed much enterprise and resource, and attained spectacular results, but better perspective will be maintained about the general operations of surface craft in the world theatre of war

by quoting the summary from the official British history: "So (in April 1915) ended the first phase of the German attack upon our sea-borne trade. Never in the long story of our wars had the seas been so quickly and so effectively cleaned of commerce destroyers, and, in comparison with what had been anticipated, the whole campaign had been singularly ineffective."

Let us here take note of the point that the want of suitable naval bases "suitably spaced from each other" (A. T. Mahan) added to the difficulties experienced by the Central Powers in conducting operations by sea, a point to be borne in mind when considering the historical precedents afforded by the World War. Another point to be noted is the revolution in facilities, both for protection of merchant ships and transports and for attacks upon them, that were afforded for the passing of information and arrangement of movements by new and more rapid means of communication, especially telegraph cables and radio-telegraphy and telephony, introduced in the years that preceded the World War.

*Respective Aims of Allies and Central Powers.*—It is desirable also to note that on the one side were belligerents whose interest it was to stop all sea traffic while the issue was being determined by land battles; on the other side, belligerents to whom sea traffic was of vital importance for troop movements, for the supply and equipment of their armies, and for the economic needs of their civil population. The Central Powers accordingly employed without scruple every resource, in the shape of surface vessels, submarines, aircraft and submarine mines sown broadcast on the high seas, in order to make the risks of sea transport prohibitive; whilst the Allies made it their business to keep the seaways open by devising counter-measures to sink, damage, blockade or otherwise render ineffective all these forms of menace. Within about eight months of the outbreak of war all serious risk from the depredations of surface craft in distant seas had, as we have seen, been averted, while the main danger, from the German High Seas Fleet, no longer existed after the battle of Jutland on May 31 1916. The greatest risk from submarines and from submarine mines in the highways of sea traffic (new features in sea warfare) continued until the conclusion of the War, and at one period the victory of the Allied and Associated Powers was in consequence seriously jeopardised.

Another matter to be considered is the effect of modern local defence weapons, especially forts and mines, upon the application of sea power in seas to which access can be obtained only through narrow defended channels. This can best be illustrated by a reference to the part taken by the British Navy, aided by the French, in the Dardanelles campaign for access to Constantinople and the Black Sea. These operations were not directed against any purely naval objective. They were initiated by a decision by the British War Council, in Jan. 1915, that the "Admiralty should prepare to bombard and take the Gallipoli peninsula with Constantinople as the objective." In order to pass beyond the Dardanelles, the war vessels would have had to go through minefields ("paravanes" had not then been invented) against a rapid current, through narrow channels under the close fire of formidable forts, exposed to torpedo attack both from the shore and from hidden torpedo craft, as well as to plunging fire from concealed mobile howitzers. Even had the warships themselves succeeded in running the gauntlet, it would not have been possible for their unarmed fuel and store ships to follow them into the Sea of Azov unless the defences of the Narrows could first be destroyed. The task proved to be beyond the powers of purely naval forces, and lessons taught by historical experience about the limitations of sea power under such conditions were once again confirmed.

*Transport of Troops.*—Taking now the several headings under which we have grouped the advantages of sea power, we observe, first, that the facility which sea power offered for the transport of hostile troops over a worldwide theatre of war was the dominating factor in the failure of the Central Powers to achieve a victory on land, their plan for so doing having been first to crush the French Army, violating the neutrality of Belgium in order to increase the frontage of advance (and so envelop the

French left flank) and then to turn their attention to the Russian Army.

It was sea power that enabled the small British Expeditionary Force to cross the Channel to stand in the path of von Kluck's enveloping army at Mons and at Le Cateau, and, when the British were cut off by Kluck from their base at Havre, it was through sea power that the base of operations was changed to the Loire. Using a new line of supply, the British were able to cross the Marne to the northward, in the gap between Kluck's and Bülow's armies, and thus to exercise a decisive influence on the most critical day of Joffre's great battle which caused the failure of the German plan of campaign. In the later stages of the War, sea power enabled the Allied and Associated Powers to transport their newly raised armies to the decisive theatre of operations against the German Army, and to take part in various campaigns elsewhere.

The completeness of control over sea communications for this purpose can be gathered from the fact that during the course of the War the sea movements of troops included about 23,000,000 individual voyages of British Empire soldiers to take part in operations overseas, and that, amongst the first 1,000,000 transported, there was not a single casualty, either from enemy action or from marine risks. This immunity continued during the War between surface craft. Subsequent losses of troops at sea, always a very small percentage of the whole, were caused mainly by submarine attack, but this new menace did not prevent the American Army from crossing the Atlantic in 1917-8 to bear its part in the final and most critical stage of the conflict on land.

#### THE FOUR MAIN ASPECTS OF SEA POWER

*Supply of Food and Munitions.*—A point not fully realised before the World War, but emphasised by experience therein, was the extent to which modern armies, after their transport to a destination beyond the sea, are constantly and continuously dependent upon sea communication for reinforcements in personnel, and for supplies, stores and equipment, to enable them to carry out their operations. This takes us to (2) the facilities which sea power confers for the supply of the necessary munitions and sustenance to armies. While the Central Powers were more self-contained, their opponents' armies would have been unable to continue the conflict on land without the sea power which placed worldwide resources at their disposal. A condition to be noted in connection therewith (and with the movement of the troops themselves considered under the previous heading), was the strain upon a country's resources in merchant shipping caused by the employment of armies in oversea operations.

The more distant the operations the greater the strain, because the voyages take longer, and more ship tonnage has therefore to be employed in proportion to the loads to be transported. Some idea of this strain upon resources in merchant ships can be gathered from these figures: Nearly 45,000,000 tons of British military stores were transported by sea during the course of the War. Towards its close, about 520 British vessels, of about 1,750,000 total gross tonnage, were employed in British military services. Excepting in the earliest stages, this may be taken approximately as the average so employed, in addition to the British vessels placed at the disposal of Allied Powers, including the vessels that were employed during the last few months in carrying about 250,000 tons dead-weight per month to the American Army in France. These statistics bring out the need for Powers, which depend upon sea communications for the sustenance of their populations, to consider the needs of those populations, when contemplating the scale upon which operations involving the use of armies overseas can be conducted.

This opens up the wide question in the exercise of sea power which we have grouped under the heading (3), the protection of merchandise, raw materials and food supplies crossing the high seas, and, conversely, (4) the amount of economic pressure which can in these days be exerted upon industrial nations, and through them upon the armies which they employ to force matters to an issue. Here again we shall be well advised to bear constantly in mind the special and unusual conditions

which applied to the great conflict. These are clearly brought out in C. E. Fayle's British "official" history of *Seaborne Trade*, in which he points out that, for all the belligerents alike, dependence upon overseas supplies was greatly accentuated by the character of the War itself. The development of naval and military material, and the direct demands of the fighting forces upon the products of industry, exceeded everything that had been known or anticipated, and those demands increased directly and indirectly the importance of maritime communications, upon which they threw a heavy strain. The blockage of the passage of supplies inevitably meant widespread interference with neutral trade, and, apart altogether from the legal aspect of the matter, it soon became evident that the dependence of the belligerents themselves on supplies from neutral countries made it impossible to ride roughshod over neutral interests. Owing to the strength of the Allies at sea rendering evasion very difficult, neutral merchants and ship-owners were ready to make large concessions rather than incur delay and inconvenience arising from the exercise by the Allies of their undoubted right of visit and search (*q.v.*), and the Allies also possessed almost a monopoly of certain supplies necessary to the neutral Powers who were in a position to assist in maintaining German trade. For such reasons it is necessary to be cautious in drawing from the World War deductions about the effect, in future wars, of the application of sea power under the headings which we are now considering.

*Protection of Merchandise.*—Taking these now in detail, the protection by the Allies of their food, merchandise and munitions crossing the high seas furnished them with a new problem of great difficulty when submarines were employed by the Central Powers as commerce destroyers, which disregarded all previous agreements amongst civilised nations for the protection of the lives of neutrals and of noncombatants at sea in time of war. It was clear that the safety of the sea communications, upon which the success of the Allied cause depended, would be of no avail if so much of the world's shipping, belligerent and neutral, could be destroyed that the residue did not suffice to maintain the traffic. Nearly 13,000,000 gross tons in all (about two-thirds British) of merchant shipping was destroyed by enemy action alone, in addition to the normal wastage. Great Britain lost most heavily, having most to lose, but the net result was thus summarised by Mr. Fayle as official historian:—

At no time was the reduction of supplies sufficient to inflict vital injury upon the life of the country . . . Had losses continued at the same rate as in the spring of 1917, had the time occupied by the round voyage in the Atlantic continued to be what it was in the autumn of that year, there would have been a different tale to tell, and the gravity of the danger should not be forgotten because it was surmounted; but in the events which happened the strain was never so great as to be intolerable.

Such were the definite results.

Looking to the future possibility of the application of sea power being revolutionised by similar depredations of submarines, note should be taken of the fact that at Washington, in Feb. 1922, representatives of the United States, the British Empire, France, Italy and Japan (the principal sea Powers) bound themselves not to use submarines in this manner, and to treat as pirates all who did so, under whatever flag (*Washington Conference Report*, Cmd. 1,627, 1922).

*Economic Pressure.*—There remains the experience gained in the years 1914-8 in exerting economic pressure by recognised methods. Owing to differences of opinion about such recognition, it was necessary for belligerents to proceed by negotiation and agreement as well as by decree, and at one time it seemed that the exercise of sea power might be stultified by new conditions (C. E. Fayle, *Seaborne Trade*, vol. 3, p. 456), but if the belligerents were economically dependent upon the neutrals, so were the neutrals upon the belligerents, and there gradually arose around the Central Powers a network of agreements and undertakings, enforced by brisker regulations, embargoes on supplies and financial restrictions, as well as by naval force, which, though no technical blockade was instituted, amounted to a more effective and drastic stoppage of enemy trade than

naval force alone had ever secured.<sup>12</sup> The methods adopted blocked the passages through ports in neutral countries, a result which could not have been achieved by blockading the sea coasts of the continental belligerents. The final result, as affecting Germany, has thus been summarised (*ibid*): "Though Germany's balance of agricultural and industrial strength fitted her to endure a prolonged period of isolation better than any other European Power, she was able to hold out for four and a half years only at the cost of a complete economic and social collapse, which was indeed precipitated by military defeat, but had already become inevitable." Nevertheless Germany was never completely isolated, having had access to Swedish ore to the end, and having twice, by the invasion of Rumania and by the collapse of Russia, replenished her food supplies at periods of acute crisis. Germany's allies were in a still more pitiful plight, and speaking generally, experience in the World War of 1914-8 emphasised, beyond all precedent and beyond all expectation, the importance of maritime communications, and therefore of sea power.

<sup>13</sup> Looking back at the great conflict, we note not only the effect, amounting to complete collapse, of the sea power of the defeated states, but also the redistribution of relative strength at sea between the victors, owing largely to the relative burden borne by them in achieving success. Full details of the economic and financial burden borne by Great Britain in the Allied cause will be found in the concluding chapters of *Seaborne Trade*, vol. 3, from which it suffices to quote the statement that "far more serious in its permanent results than any direct effect of the constriction of supplies was the financial situation produced by the reduction of the export, and the redirection of both the export and the import trade. For these the submarine campaign was, in large measure, responsible." The new conditions affect especially the application of sea power to the Pacific ocean.

**SEATTLE**, Wash., U.S.A. (see 24-563), increased in population from 237,194 in 1910 to 315,312 in 1920 (113.5 males to 100 females), of whom 80,976 were foreign born, including 6,016 Japanese; in 1925 (estimate based on school census), 355,000. The land area in 1925 was 68.5 square miles. Bank clearings increased 245% between 1910 and 1924 (to \$2,039 million); bank deposits, 125% (to \$176,608,338). The output of the factories within the city limits was valued at \$50,814,000 in 1909; \$274,431,000 in 1919; \$115,046,908 in 1921; \$155,780,967 in 1923, when there were 836 establishments, employing 17,842 wage-earners. During the War shipbuilding employed 30,000 to 40,000 workers, directly and indirectly. Waterborne commerce reached its peak (measured by value) in 1918 and 1919, but after the post-War drop again increased, until in 1924 its value (\$664,567,049) was seven times that of 1910. The greatest increase was in foreign imports (1,112%), with domestic imports next (624%), followed by foreign exports (490%) and domestic exports (280%). In 1924 Seattle was a port of call for 65 steamship lines; it received 70% of the raw silk entering U.S. ports.

Under the public corporation known as the Port of Seattle, organised in 1911, harbour facilities were developed to a valuation of \$15,000,000 by 1924, including terminal wharves (two of them half a mile long), transit sheds, waterside warehouses and cold-storage plants, grain elevators and tanks for vegetable and fuel oils. In 1911 the city took its first step towards municipal ownership and operation of the street railways; by 1925 it owned and operated 235 m. of the total of 265. The municipal light and power plant, in the face of determined opposition from the private power companies operating in the city, built up its

patronage until in 1924 it had 83,000 of the total 108,000 customers in the city. In 1924 the first unit was completed of a development on the Skagit river which will reach ultimately 550,000 to 600,000 horsepower. A large amount of building of all kinds (including a 42-storey building) was done immediately after the War, the permits for 1919-25 (through Oct.) representing a value of \$140,286,145. A zoning ordinance was adopted in 1923. A civic centre was developed. Parks and playgrounds were increased until the area amounted to 1,900 acres. Scenic boulevards were constructed to the extent of 35 miles.

**SECONDARY SCHOOLS.**—This term is used, both in Great Britain and America, for schools in which education beyond the elementary or first stages is given to both boys and girls.

### I. IN GREAT BRITAIN.

Before the outbreak of the World War in 1914, there was a steady growth in the number and the efficiency of secondary schools in Great Britain. Local education authorities, under the powers conferred upon them by the Act of 1902, took over or made annual grants to existing schools and created new schools; and the Board of Education's regulations for 1907—providing for increased and uniform grants, subject to conditions, of which the most important was the provision of free places for ex-public elementary school children—both stimulated and guided fresh developments. These developments reacted upon the schools which remained independent of state or local control, and provided them with a powerful incentive to efficiency.

In the 10 years ending 1914-5 the number of schools on the grant list in England and Wales rose from 575 to 1,047, and the number of pupils per 1,000 of the population from 2.9 to 5.5; moreover, the average size of the schools has shown a remarkable increase, which has naturally made for efficiency. In 1908-9, 64 out of 912 schools had less than 50 pupils while at the present time, not more than 8% of the total have less than 100. The free place system, working in with the provision of scholarships both by the schools and by local education authorities, and also with the provisions made for the education of teachers, helped the efficiency of the schools; it was largely responsible, especially through the provision of intermediate scholarships at 15-16, for raising the standard of work up to and beyond the matriculation stage, and through the fixing of age limits for scholarships and free places it helped to bring about a general standardisation of the age of entry to secondary schools; and this again affected both the leaving age and the length of school life.

The number of schools in which a considerable amount of sixth form work is done has increased steadily, and though the economic conditions which tend to the premature withdrawal of boys and girls from school are slow to change, there has been a steady improvement; the average school life of boys rose from two years and seven months in 1908-9 to three years and five months in 1922-3, and that of girls in the same period from two years and seven months to three years and six months, while the average leaving age rose in the case of boys from 15.5 to 15.11, and in the case of girls from 15.11 to 16.2.

Most of this development, however, belongs to the period beginning in 1914. Within a few months after the beginning of the War, it became evident that there was an astonishing increase in the demand for secondary education. This demand persisted all through the War, and although the economic difficulties of the last few years have had their effect upon it, and the diminution in the birth rate during the War is bound for some time to lessen the number of children available, this new desire for education is still, and will surely continue to be, alive and active.

That desire has shown itself not merely in the increase in the numbers applying for admission to secondary schools but even more in the support given to the important educational measures introduced during this period.

As to the schools, the numbers on the grant list for England and Wales in 1924-5 were 1,281 (471 boys', 462 girls' and 348 mixed schools), containing 188,268 boys and 171,176 girls; the number of pupils per 1,000 of the population, which in 1904-5 had been no more than 2.9 (1.9 boys, 1.0 girls), was now 9.5 (5.0 boys, 4.5 girls); between 1908 and 1920 the number of boys proceeding to universities increased from 695 to 1,674, and the number of girls from 361 to 1,214. Besides the schools on the grant list, the Board of Education has now recognised as efficient after inspection about 270 public and private secondary schools and about 100 private preparatory schools. The average size of the schools on the grant list rose from 190 in 1914-5 to 281 in 1924-5; the number of free place pupils rose from 65,799 (33.1% of the total numbers) in 1914-5 to 130,188 (36.2% of the total numbers) in 1924-5.

**Financial Aspects.**—So great an expansion would have been impossible without a great increase in expenditure from both rates and taxes over anything that was contemplated in 1902, or even on the introduction of the free place system in 1907. Though few authorities as yet maintain free secondary schools, and fees have been generally raised by about 50%, there are few schools on the grant list in which any pupil's fees cover as much as half the cost of his education. The increase in the board's grant from £5 per pupil over 12 to £7 in 1917, together with special grants for advanced courses, brought some relief, but it was not until the Act of 1918 repealed the 2d. limit on rate aid to higher education, and also provided that the state contribution should be not less than one-half of the local education authority's approved expenditure, that the necessary progress could be faced.

**Status of Teachers.**—One of the earliest consequences of this provision was an improvement in the salaries of teachers, brought about for the first time on a national basis in 1920, by the standing joint committee of representatives of local educational authorities and teachers, constituted under the chairmanship of Lord Burnham, at the suggestion of Mr. Fisher. The Teacher's Superannuation Act of 1918 had established a pension system modelled on the civil service scheme; and though financial stress led before long to the requirement of contributions from the teachers to the cost of pensions, and again in 1925 to a modification of the salary agreement, the position of the teachers has been substantially improved and the work of the schools has benefited.

**Examination Reforms.**—Two valuable reforms were initiated by the Board of Education in 1917. The secondary schools had long suffered from the number and variety of external examinations, many of which had originally served a useful purpose in stimulating a tradition of organised work, but had become oppressive and confusing. The consultative committee of the board had issued a report on the subject in 1911; in 1914 the board, which had already abolished in schools under its control the use of external examinations for lower and middle forms, issued proposals for the recognition of two grades of examination—roughly speaking a fifth form examination for pupils of 16–17 and a sixth form examination for pupils of 18–19—to be conducted by university examining bodies. In 1917, the secondary schools examinations council, representative of the examining bodies, the local education authorities and the teaching profession, was established as a co-ordinating authority, and since then the first and second school examinations of one or other of eight university examining bodies have gradually become a useful element in the organisation, not only of schools under the board's control but of secondary schools of every kind. In grant-aided schools the board pays the examination charges for each pupil up to a maximum of £2. In 1923–4, 39,973 pupils in grant-aided schools took a first examination and 5,342 a second.

**Advanced Courses.**—The second reform was the encouragement of sixth form work by the provision of special grants for recognised advanced courses in certain groups of subjects; the grouping of subjects, at first conceived on a rather rigid formula, has been greatly modified, and almost any kind of advanced work likely to be done in a secondary school may now be recognised; but the special grant, except for schools taking no aid from local education authorities, has now been merged in the general provision made by the Act of 1918. In 1924–5, 469 advanced courses were recognised (235 in science and mathematics, 37 in classics, 188 in modern studies, 6 in classical with modern studies, 3 in geography).

**Connection with Universities.**—With the increase in the numbers of secondary school pupils, the relation of the schools both to the universities and other places of university rank and to employment, has become increasingly important. The first and second school examinations are of real value in both connections, and are gradually simplifying the conditions of entrance to the universities and the professions, and even to some extent commerce and industry. Most local education authorities interest themselves systematically in finding suitable openings for the pupils in their schools. In London, two joint committees of

heads of schools and employers find employment for a very large number of boys and girls, and this work grows rapidly.

In 1920, the board instituted a scheme for the award of 200 state scholarships to universities for pupils in grant-aided secondary schools; the scheme was dropped in 1922 and 1923, but revived in 1924. The award is based on the second school examination; the amount varies with circumstances but is calculated to finance the whole of the scholar's university course. But the various provisions by which poor students may be aided so as to enable them to pursue university and other higher courses are still in urgent need of revision and co-ordination; this is perhaps the weakest spot in the educational system. (R. F. C.)

## II. IN THE UNITED STATES

The high schools of the United States have shown phenomenal expansion in pupil attendance. In 1900 there were 519,251 pupils registered in public high schools. In 1910 the number had increased to 915,061; in 1920, to 1,857,155; in 1922, to 2,229,407. The ratio of registrants to the total population of high-school age is approximately 1 to 3. Nowhere else is there any approach to this ratio. It is estimated that in England and Germany the ratio never was less than 1 to 12 or 20. These statistics make it clear that the most striking fact, with regard to the American democratic school system, is the opportunity which it affords to young people of all social and economic conditions to secure an education beyond the elementary level. Especially striking is the development of a great many small high schools in rural and town communities which a generation ago were satisfied with elementary schooling. When rural communities cannot establish high schools they have very commonly induced the legislatures of their states to provide generously for the payment of tuition of pupils in the neighbouring districts where there are such schools.

**Curriculum Changes.**—With the increase in pupil population has come an expansion in the curriculum. Changes in the curriculum are due in part to the demands made by the new type of pupils coming into the high-schools, and in part to a recognition on the part of educators that new subjects are necessary to prepare young people for modern life. Chief among the additions to the curriculum are commercial courses (see COMMERCIAL EDUCATION) and industrial courses (see INDUSTRIAL EDUCATION). Correspondingly there has been a falling off in the percentage of the high school population which takes the classical courses. The details of this change in so far as it affects Latin and Greek and certain other subjects are shown in the following table:—

*Percentage of the Total Pupil Registration in High School Taking Various Subjects*

|                    | 1900  | 1905  | 1911  | 1915  | 1922  |
|--------------------|-------|-------|-------|-------|-------|
| Latin              | 50.61 | 50.21 | 49.05 | 37.32 | 27.52 |
| Greek              | 2.85  | 1.47  | 0.75  | 0.29  | 0.09  |
| French             | 7.78  | 9.14  | 9.90  | 8.80  | 15.46 |
| English Literature | 42.10 | 49.34 | 57.09 | 55.82 | 78.59 |
| Rhetoric           | 38.48 | 48.54 | 57.10 | 58.42 | ..    |
| Home Economics     | ..    | ..    | 3.78  | 12.89 | 14.27 |

**Trends of Expansion.**—There is a strong tendency for the high school to expand downward and upward, so as to include within the scope of secondary education the later years of the traditional elementary curriculum and the early years of the college.

The two special names which have been employed to designate the expansions downward and upward are junior high school and junior college. The growth of the junior high school has been very rapid during the years 1910–25. It was first established in such centres as Berkeley, Cal.; Columbus, O.; and Concord, New Hampshire. It has taken on a great variety of forms. In some cases it has been a pre-vocational school; in others it has administered a curriculum very like the curriculum formerly given in the first year of the high school. In a great many cases it has been a high school only in administrative treatment of the pupils,

retaining the curriculum which belonged to the seventh and eighth grades of the elementary school.

The junior college has developed in about 75 cities of the United States as an extension of the public high school. In approximately an equal number of centres the junior college has developed independently of other higher institutions. There seems to be a tendency to provide very generally for the training of pupils beyond the present high school age by organising college courses in local high schools where they will be readily and economically accessible. There is also an academic reason for this development in the fact that the courses now commonly taken by college freshmen and sophomores are much more closely related in methods of instruction and in content to high-school courses than they are to senior college courses.

*Teachers.*—The standards for the training of secondary teachers in the United States are steadily rising. College graduation and professional courses in general school administration and in methods of teaching are generally required. Standardising and accrediting associations have been organised in all sections of the country. There were in 1926 more than 14,000 accredited high schools in the United States. (C. H. J.)

**SECOND (SOCIALIST) INTERNATIONAL.**—The first meetings of the Second International, reconstituted in 1889, had been devoted mainly to discussion of the tactics and methods of the affiliated national parties, but from 1911 onward another question occupied a constantly increasing attention—the question of war and peace. It had already been discussed at the Congress of Amsterdam in 1903, and from that date Jaurès began the study of the question which inspired his book, *L'Armée nouvelle*. At the Congress of Stuttgart in 1903 the question was again discussed, at greater length, and Hervé's outburst on this occasion led Bebel and Volmar to declare roundly that the Social Democrats would instantly rise as one man to defend Germany if ever she were attacked.

*Conditions Before the War.*—But the European horizon steadily darkened, especially after 1911. The Agadir incident, the Italo-Turkish War and the Balkan Wars, in succession, made the menace of a general conflagration appear imminent, and the efforts of the socialist parties to avert the catastrophe became more urgent and strenuous from that time. Their efforts culminated in the Extraordinary Congress (1912) at Basle, called to consider the international situation and the action to be taken by Social Democrats to prevent war. A manifesto was issued, exhorting all workers to unite to secure from their governments a pacific foreign policy.

This problem of peace—now practically the sole problem, for everything depended on the turn that events would take—was put on the agenda for the 10th Congress of the International which was to have been held in Vienna two years later, in Aug. 1914. The Congress would have coincided with the 50th anniversary of the founding of the International in London in 1864. For this occasion Austrian socialists had prepared an illustrated commemorative album in which Kautsky, Victor Adler and others had related the history of the socialist movement during the last half century. This document, which appeared in print at the moment when the World War broke out, was distributed 10 years after as a souvenir among members of the Executive Committee of the International when they met in the former capital of the Habsburgs in June 1924. The album contains, among other things, a series of medallion portraits of 66 members of the B.S.I. (International Socialist Bureau), which had its headquarters before the War in the Maison du Peuple at Brussels. Lenin's portrait is not among them, although he was a member of the Bureau for many years; but there are Rosa Luxemburg and C. G. Rakovsky, together with Jaurès, Ebert (the future president), also Stauning, Branting and MacDonald, who later became premiers of Denmark, Sweden and Great Britain respectively. There are delegates of trade unions too, but these are few and far between. This assembly, representing all the live forces of socialism, met for the last time at the Maison du Peuple, Brussels, on July 29 and 30 1914.

Even at that moment, when the world already lay under the

shadow of war, optimism still prevailed. Adler regarded a war between Germany and France as a moral impossibility; Haase, chairman of the Social Democratic group in the Reichstag, relied at this eleventh hour, not on humanity, but on the pusillanimity of the Kaiser. Jaurès, speaking on the evening of July 30 for the last time, still affirmed his confidence in a pacific solution, but prophesied in a flash of inspiration that if, in spite of all, war were let loose on the world by its masters, then, at the close, each nation would turn upon those responsible for the disasters of the war and say: "Go, and seek pardon from God and man." The next day he was assassinated in Paris, and a state of war had been declared in Germany.

The bursting of the storm put an abrupt end to all international activities (see SOCIALISM). While the War lasted no single meeting of the Executive Committee took place, but some tentative efforts were made to revive international action. The most important of these were an attempt by the Dutch-Scandinavian Committee (vigorously supported by Camille Huysmans, Secretary of the Second International) to convene an International Congress at Stockholm in 1917, and that of the Italian socialist Morgari to convoke conferences at Zimmerwald (Sept. 1915) and at Kienthal (April 1916). The first of these efforts (the projected Stockholm conference) proved abortive because of the refusal of the Allied Powers to grant passports to the delegates; at the Zimmerwald and Kienthal conferences only certain groups of the international proletariat were represented, and from these elements there was presently to emerge the Communist International known as the Third International.

*Activity After the Armistice.*—On the morrow of the Armistice the need for international unification was brought home with renewed force. Conferences were summoned successively at Berne (Feb. 1919), Lucerne (Aug. 1919) and Geneva (Aug. 1920) with a view to re-establishing the Second International. Meanwhile, however, the so-called Third International had been formed at Moscow, and for some time parties or groups<sup>1</sup> who were unwilling to be affiliated to either the Second or the Third grouped themselves in a Workers' International Union of the Socialist Parties with Vienna as its centre—hence the name "Vienna International." In the beginning of 1920 this organisation tried to bring about the unification of all proletarian organisations, and succeeded in calling together in Berlin a reunion of the Executive of the three groups in April 1922. But this effort at reconciliation ended in complete failure.

Since then the Communist International has steadily accentuated its violent opposition to Social Democracy. On the other hand the points of dispute between Vienna and London became progressively less. In 1921-2 the French, English, German, Italian and Belgian socialists who were adherents either of the Vienna International or the Second International met first in Paris, then in Frankfurt, and of one accord adopted the resolutions which have since become famous as the "Frankfurt Resolutions." Anticipating the Dawes scheme, these demanded the reduction of the German debt to a reasonable figure, and, further, demanded the end of military occupations and the annulment of inter-Allied debts.

*Congress at Hamburg.*—By December of the same year Vienna and London had agreed to call a socialist international congress at Hamburg. This took place on May 27 1923, when the International was reconstituted—the Communists being excluded—and the conditions on which parties or groups could be admitted were defined. Agreement was reached with difficulty on a Franco-German text which, drawing on the Marxian vocabulary for its somewhat heavy terminology, appealed to "those who acknowledged the aim of the working-class to be the replacement of the capitalist mode of production by the socialist mode of production and who see in the class struggle (*lutte des classes*) which manifests itself in political and economic action the means of emancipating the working-class."

But when it came to translating this text into English the

<sup>1</sup> The principal groups concerned were the British I.L.P., the German Independent Socialists and the Austrian Social Democrats. (Ed. E. B.)

British delegates raised a discussion, arguing that the words "*lutte des classes*"—the touchstone of socialism on the Continent—were not in current use in England; that the extremists, who alone used the expression, spoke not of "class struggle" but of "class war" and that it would be better in these conditions to retain the idea but to paraphrase it in some way as this: "independent political and industrial action of the workers' organisations." And so it was arranged. The Franco-German text was retained, for it could only have been altered at the cost of emasculation; but for British consumption a free translation was allowed.

The present writer has thought it necessary to report this little incident, as it cannot fail to be instructive, showing as it does that, in spite of community of words and, on the whole, unity of tactics, English Labour men and continental socialists do not speak quite the same language. Now, these differences of terminology are the outward expression of other more deep-rooted differences arising out of the widely differing environment in which contemporary socialism is formed and developed. On reading such pre-War books, for instance, as the *Études socialistes* of Jean Jaurès, Ramsay MacDonald's *Socialism and Society* or Rakovsky's *Das Erfurter Program*, we see how widely the socialism of Jaurès, instinct with the spirit of the French Revolution, and still more the socialism of Ramsay MacDonald, who draws inspiration from the pacific and fraternal idealism of Christianity, is to be differentiated from the more "materialist" and more "economic" socialism of the German Marxians.

Since the War, however, these differences have become less acute, even from the theoretical point of view. A sort of amalgam has been established between the various national parties: German socialism has become less doctrinaire; French socialism has drawn nearer to Marxianism under Guesdist influence; the socialism of the I.L.P. has almost completely captured English working-class movement. Between those parties which recognise Social Democracy as their basis, there exists not only International unity of organisation, but unity of programme.

This emerges clearly from the two first congresses of the new International. The Hamburg Congress of 1923 succeeded beyond all expectations. There were present 630 delegates from 30 countries, representing 7,000,000 affiliated members. During the debates, which lasted five days, the following points were discussed: international action against international reaction, working-class policy on an imperialist peace, the eight-hour day, and the reform of international social legislation. But the most important achievement of the congress was the fusion of the London and Vienna groups and the adoption of the statutes of the new workers' and socialists' International.

In the three years preceding the Second Congress of the new Second International (Aug. 1925) that organisation was finally consolidated, and began to make itself more and more felt in international politics. There is no gainsaying the fact that direct action by the workers and the existence in all Western countries of a powerful socialist party (either working within the government or using its influence from outside) have to a very large extent determined the new policy which eventually produced the London agreement on reparations (1924) and the Locarno pact of mutual guarantee. To be convinced of this we have only to look for a comparison at the resolutions passed at Hamburg on the reparations problem and those at Marseilles on security. There can be no better instance of the influence which socialism has acquired over the various governments and of its emergence as the decisive factor in matters of international policy. For bibliography see the article SOCIALISM. (E. VA.)

**SECRET SOCIETIES, CHINESE** (see 9.870).—Most are merely trade guilds or friendly societies, but the Hung, or Triad, Society is in an entirely different category. It has the largest membership of any secret society in the world, and has existed since A.D. 386, in close association with the White Lotus. Contemporary with the ancient mysteries, it is itself a great mystery rite over 1,500 years old.

A few secular references to it must suffice. In A.D. 386 it was founded, or perhaps reorganised, by the Buddhist patriarch Eon

or Hwui-Yin at Rozan, to spread the cult of Amitabha Buddha. In A.D. 630 Zendo joined it to gain instruction, and in 1344 it rebelled against the Mongolian or Yüen dynasty. In 1662 it fell under the ban of Khang Hsi, who in his *Sacred Edict* instituted a persecution of the Buddhists and Taoists, and ordered the suppression of five religious societies, among which the White Lotus and the Hung were specifically named. The exact relation between these societies is still obscure, but, if they were not alternative titles for the same organisation, they were probably the names of different degrees of one common rite. It is just possible, however, that they were similar, but separate, mystical societies.

Partly as a result of this persecution, the Hung Society became political and anti-dynastic, and has raised numerous insurrections against the Manchus, one of the most famous being the Taiping revolt in 1851, and it is more than suspected of being behind the anti-foreign agitation of 1925. The rituals were peculiarly suitable for conversion from religious to political aims, since the slogan of the brotherhood is "Overthrow Tsing and restore Ming."

Ming means Light, and especially the perfected spirit in man; while Tsing means the vital force or, as we should say, the soul immersed in matter. By slightly changing the way in which the character for Tsing is written, it becomes the name of the Manchu dynasty, while the last Chinese dynasty was the Ming. Hence it will be seen that the change from a Buddhist-Taoist mystical initiatory rite to a dangerous political society was easy.

The rituals show a blending of Taoist-Buddhist ideas, having curious analogies with the Egyptian *Book of the Dead*, and with certain "Higher Degrees" in western speculative Freemasonry. The ceremony symbolises the journey of the soul through the Underworld and Paradise to the Holy City of the Gods, here called the City of Willows, and interwoven with this is an allegory of the experiences of the mystic in his quest for union with the Supreme Being. As regards its analogies with Masonry, practically every important incident is found in certain "Higher Degrees" in England and America, while most of the hand signs are known to many Freemasons.

The ceremony falls into four sections. First comes the traditional history, which is given to the candidates in the anteroom before they enter the lodge. It is a moving story, wherein a body of monks who had helped the Emperor are requited by him with the foulest treachery, all being murdered, save five who became the founders of the order. There are three villains, and for political purposes one is a Manchu Emperor, either Khang Hsi in some versions, his son, but originally the story was allegorical.

After this the candidates are "prepared" in the anteroom. The most notable incidents are (a) ceremonial washing and changing into white robes to symbolise not only mourning but that they themselves are dead; (b) the right arm, shoulder and breast, and also the left knee, are made bare; (c) the substitution of grass slippers for ordinary boots. Meanwhile the Master opens and consecrates the Lodge and invests his officers.

The third section deals with the actual admission of the candidates, who have to pass through three gates inside the lodge, and take the oath of blood brotherhood by mingling their blood with that of all members present in a cup of wine, from which each person present drinks. (Women as well as men are eligible.)

The last section consists of a catechism, wherein the Master asks a series of questions, which the conductor answers for the candidates. From these we learn that they have been on a long and mysterious journey, first by land and then by boat, till they reached the City of Willows. Throughout the whole of this part of the ceremony great stress is laid on numbers which have a definite mystical significance. The triangle also plays an important part in the ritual, hence the name "Triad" Society. The brotherhood has many aliases, the most famous being "The Society of Heaven and Earth." The significance of the ceremony is revealed by the opening questions:—

Master: Whence come you?

Vanguard: From the East.

Master: At what time?

Vanguard: At sunrise, when the East was light:

**BIBLIOGRAPHY.**—There are only three really important books on the subject, and the two earlier have not the complete ritual: G. Schlegel, *Thian Ti Hwui, the Hung-League* (Batavia, 1866), out of print; W. Stanton, *The Triad Society; or, Heaven and Earth Association of Hong-Kong* (1900); J. S. M. Ward and W. G. Stirling, *The Hung Society* (3 vol., 1925-6), published by the Bookerville Press, Ltd., London. (J. S. M. W.)

**SECURITY.**—The problem of security confronted the Allies immediately after the Armistice of Nov. 11 1918. Germany's military capitulation put an end to hostilities and permitted the victors to impose their conditions of peace on the vanquished. The sum of these conditions was to constitute a guarantee of the new European status and of the peace of the world. But it inevitably involved painful readjustments and burdensome obligations for the conquered party. It was, therefore, necessary to find a system to guard against wars of revenge. The League of Nations was formed for this purpose.

Unfortunately, the Covenant of June 28 1919, while laying down tutelar rules, did not establish sufficiently rapid, precise and energetic practical sanctions against a possible aggressor. Clemenceau and Marshal Foch would have wished France's security to be guaranteed by fixing the western frontier of Germany on the Rhine, and by forming the German territories on the left bank of the Rhine into an independent buffer state. They set out this point of view in a series of notes or memoranda dated Feb. 27 1918, Jan. 10, Feb. 25, March 12 and 31, April 28 and May 6 1919. Having failed to convince the representatives of Great Britain and the United States, Clemenceau ended by accepting the offers of Lloyd George and President Wilson, which substituted for the political and military Rhine frontiers two treaties stipulating that if Articles 42, 43 and 44 of the Treaty of Versailles relative to the demilitarisation of the left bank of the Rhine "may not at first provide adequate security and protection to France," Great Britain (or the United States as the case might be) pledges herself "to come immediately to her assistance in the event of any unprovoked movement of aggression against her being made by Germany." The two treaties hung together, and were not to take effect until they had been approved by the British Parliament and the Senate of the United States of America. The latter having refused its ratification in 1920, the two treaties became null and void.

#### THE PROJECT OF A FRANCO-BRITISH PACT

The British Govt. admitted none the less a moral obligation to give France equivalent guarantees of security. In 1921 Briand held negotiations on this subject with Lloyd George and Lord Curzon. At the Conference of Cannes (Dec. 1921-Jan. 1922)<sup>1</sup> concrete proposals were considered. On Jan. 4 1922 Lloyd George laid a detailed memorandum before Briand, in which he declared that the conclusion of a new pact of non-aggression must be dependent on the following conditions: complete understanding between the two countries; no naval rivalry; non-execution of the French programme of submarine construction; whole-hearted co-operation by France with Great Britain in the economic and financial reconstruction of Europe; an immediate summoning of an economic conference at which all European Powers, including Russia, should be represented; a complete agreement between the two countries on the policy to be pursued in the east; the adoption of a broad plan of international co-operation to ensure the peace of Europe as a whole. Briand replied on Jan. 8 by demanding that the engagements be bilateral, and that a military convention be concluded between the two general staffs. He added: "Whatever may be the guarantees offered by the League of Nations, it will be well that the Powers between which, as a result of the peace settlement, causes of dispute are most likely to arise should show, by some means even more precise than the Covenant, the sincerity of their desire for peace." Briand thought fit to accept the summoning of a practically universal conference in Genoa before these broad questions were properly explained, and without having consulted his own Government; he was, therefore, obliged to retire.

At the end of Jan. Poincaré resumed the negotiations, insisting

<sup>1</sup> The Conference formally opened on Jan. 6 1922, informal conversations having been held previously.

on the necessity for France to be protected against German aggression, and on the necessity of a military convention between France and Great Britain. But the conversations and memoranda revealed little unity. Especially they showed that, as Lord Curzon put it, the general responsibility of Great Britain resulting from the stipulations of the Covenant was "attenuated in the collective responsibilities of the other Powers,"<sup>2</sup> and that these stipulations, to be effective, should be complemented either by particular agreements or by a new convention complementary to the Covenant. Simultaneously with the Franco-British project, the projected pact between Great Britain and Belgium, which was being negotiated, fell through. Furthermore, the Cabinet of London refused to conclude a defensive military agreement with Belgium analogous to that which that Power had signed with France in 1920. The problem of security thus passed from the Franco-Belgian-British sphere of action to that of the League of Nations.

#### THE PLAN OF THE TREATY OF MUTUAL ASSISTANCE

The Third Assembly, which met at Geneva in the month of Sept., passed a resolution (No. 14) by the terms of which the states which were members of the League of Nations should pledge themselves mutually to military assistance against aggression. But the end of 1922 and the early part of 1923 were devoted to preliminary negotiations on the means of giving this resolution practical form. On the initiative of Lord Robert Cecil and Col. Réquin, two special commissions succeeded in drawing up a draft Treaty of Mutual Assistance which was presented to the Assembly of 1923. This plan was based on the following ideas:—

- (1) A pre-arranged plan of defence;
- (2) A pledge binding all members of the League of Nations to come to the assistance of the state attacked;
- (3) Liberty for members of the League of Nations to conclude local defensive agreements, complementary to, their general obligations;
- (4) The obligation of assistance to be limited to countries situated in the same part of the globe; the globe to be divided into several regions by which this obligation should be defined;
- (5) Control by the League of Nations of the whole operation of the Treaty of Mutual Assistance.

After a detailed discussion, the Fourth Assembly unanimously passed a resolution on Sept. 29 asking the Council to submit the project of a Treaty of Mutual Assistance to the scrutiny of the governments and to ask them to give their opinions on it. In accordance with this resolution, the general secretary had only communicated the plan to the states which were members of the League of Nations. But at its session in Dec. the Council determined to approach the other states as well, notably Germany, the United States of America and Russia.

The answers arrived slowly. The majority were unfavourable. Russia sneered at the efforts of the Powers to ensure universal order. Germany took the opportunity to protest against the status of a suspect assigned to her by the Treaty of Versailles and demanded compulsory and universal disarmament. On July 5 1924 Ramsay MacDonald declared that the League of Nations ought not to take the responsibility of recommending a plan to its members unless this plan was "in all respects reliable and effectual," and that this was not the case with the document submitted to the governments. He rejected the principle of special local treaties, demanded that they should be replaced by a general pact, and recommended arbitration as the solution of conflicts. In the face of this opposition, the projected Treaty of Mutual Assistance could not take form: it was abandoned.

#### THE PROTOCOL OF GENEVA

At the Fifth Assembly, Herriot gave the outlines of a new programme founded on the three principles of arbitration, security and disarmament. After confidential conversations, MacDonald and Herriot agreed on a scheme which several commissions and subcommissions were appointed to transform into precise arrangements. Thus the Protocol of Geneva was worked out, being

<sup>2</sup> French Yellow Book, 1129.

voted enthusiastically and unanimously on Oct. 2. As regards security, Articles 10 and 16 of the Covenant were complemented by a series of arrangements (Articles 7 to 15) defining the word "aggressor," instituting enquiries into complaints of violation of the obligations of states; fixing the mechanism for the repression of acts of aggression, pronouncing sanctions against aggressors and giving the states authority to undertake engagements among themselves, "each determining in advance the military, naval and air forces which they would be able to bring into action immediately to assure the fulfilment of the obligations in regard to sanctions which result from the Covenant and the Protocol." Two detailed reports handed in by Dr. Beneš and M. Nicolas Politis contained most interesting commentaries.

Article 17 of the Protocol arranged for the meeting at Geneva of an International Disarmament Conference for June 15 1925. Consequently on Oct. 3 1924 the Council appointed a committee to co-ordinate the preparatory work. This was to meet on Nov. 17. But, in the interval, Lord Parmoor informed the Council that, in consequence of the dissolution of the British Parliament, it was desirable to adjourn the meeting. On Nov. 15 the new British Govt. demanded its adjournment to an indefinite date in the future. At the session of March 1925 Sir Austen Chamberlain read out to the Council a declaration which affirmed the rejection of the Protocol by the British Empire on the ground that the obligations involved in it were too great, in view of the extent of the British Empire, and that the Cabinet of London could not undertake to maintain peace in several sectors, for example, in eastern Europe. Without the adherence of Great Britain, the Protocol could not be applied. Accordingly, the Council determined to refer for the consideration of the Sixth Assembly the declaration of the representative of the British Empire, with all other declarations which might be addressed to it on the same subject by the governments of members of the League. A solution of the problem of security by a general pact failed in its turn after it had been found impossible to arrange a Franco-Belgian-British Guarantee Pact. There remained the intermediary solution of a partial pact including several leading Powers and one or more ex-enemy Powers, including Germany.

#### THE LOCARNO NEGOTIATIONS

This was a combination which was realised in the course of 1925. Its point of departure was a German memorandum dated Feb. 9, in which Stresemann suggested the conclusion of a Guarantee Pact for Germany's western frontiers and treaties of arbitration with all her neighbours. He let it be understood at the same time that the logical sequence of this Pact should be the evacuation of the Rhineland. The Memorandum was long kept secret, at least in its exact phrasing, and it was several months before it received a direct answer. First France and Great Britain, then Belgium, Italy, Poland and Czechoslovakia agreed in the course of the spring and the summer to lay down the following essential principles in the notes which they delivered on June 16 and Aug. 24:—

- (i) Germany and France must engage to respect the present territorial status quo of the Treaty of Versailles, as well as the agreements whose object is to assure their application, and to repudiate any recourse to force of arms or to war against each other.
  - (ii) The engagements undertaken by these two parties must rest on the demilitarisation of the Rhine frontier and its inviolability. The exceptional cases in which it would be permissible for military forces to cross this frontier must be fixed in precise terms.
  - (iii) Great Britain, and if necessary Italy, must be guarantor of the execution of the engagements undertaken.
  - (iv) Germany must enter the League of Nations and assume the rights and obligations of the states which are members of this league.
  - (v) Germany must conclude treaties of arbitration with her neighbours: the treaties with Czechoslovakia and Poland must be such that they can be guaranteed by France.
- At the beginning of Sept. the Allies invited the legal experts

of the principal states interested to meet in London and there to work out a plan in conformity with the above principles. The experts finished their task while the Sixth Assembly of the League of Nations was sitting. The statesmen then united at Geneva having considered the results of the work of the experts, the French ambassador at Berlin handed to Stresemann, on Sept. 15, a note proposing that a conference should be held in Switzerland at the end of Sept. or the beginning of October. On Sept. 26 Stresemann accepted the offer for Oct. 5. At the same time he again made the reservation that the entry of Germany into the League of Nations must not be interpreted as recognition of the responsibility with which the German people were charged by Article 231 of the Treaty of Versailles, and he demanded that the Cologne zone be first evacuated. Belgium, France and Great Britain took cognisance of Germany's acceptance, except of the clause containing the reservation relative to Article 231 of the Treaty of Versailles, while they pointed out that it depended on Germany herself to accelerate the evacuation of the Cologne zone by executing her obligations of disarmament. Under these conditions the delegates of the interested Powers met at Locarno on Oct. 5.

As the basis of their deliberations, they took the draft of the experts, several articles of which were adopted as they stood, and others maintained with slight modifications. The question of the responsibility for the War and of the evacuation of the Rhinish zone was left aside. The chief difficulties were those concerning the guarantee of the Treaties of Arbitration, the formulation of these Treaties, the interpretation of Article 16 of the Covenant and the authorisation for France to cross the demilitarised Rhine zone to come to the assistance of her Allies in the east if attacked. After ten days of wearisome negotiations an agreement was reached on the disputed points. Germany abandoned her opposition to the mutual guarantee of the Franco-Polish and Czechoslovak Treaties of Arbitration. The Allies, on the other hand, consented that this guarantee should be worded in the Rhine Pact in the general form which would be more acceptable to Germany without changing anything of its nature or the effectiveness of the guarantee. In the second place, Germany consented that the Czechoslovak and Polish Conventions of Arbitration should be identical with those of France and Belgium, and that they should be integral, that is to say, that the pacific settlement of international differences should be extended to all these questions. Finally, Germany and the Allies arrived at a compromise relating to Article 16 of the Pact of the League of Nations, without infringing in any way on the essential principles of this Article, by means of a collective note. It was thus possible to sign the final Protocol on Oct. 16 containing what is called the Locarno Pact, which consists of the following diplomatic documents:—

- (a) Treaty between Germany, Belgium, France, Great Britain and Italy, called the Rhine Guarantee Pact;
- (b) Four Treaties or Conventions between Germany on the one hand, and France, Belgium, Poland and Czechoslovakia on the other;
- (c) Treaties of Guarantee between Czechoslovakia and Poland and France;
- (d) A collective note of the states which participated in the Conference of Locarno regarding Article 16 of the Covenant of the League of Nations in case Germany should enter the League of Nations.

#### THE RHINE PACT

The Rhine Pact solved the problem of security in the following fashion:—

- (a) Germany, France and Belgium undertook to respect the inviolability of the German-Franco-Belgian frontiers.
- (b) Germany, France and Belgium mutually undertook in no case to attack or invade each other or resort to war against each other; that is to say, they pledge themselves never again to make war.
- (c) The obligation not to make war in the future does not apply in the case of legitimate self-defence, of resistance to

a violation of the Treaty of Versailles relative to the demilitarised zone, nor to the case of the execution of obligations arising out of membership of the League of Nations and the application of Articles 15, paragraphs 7 and 16 of the Covenant. Armed intervention can take place without the previous decision of the Council of the League of Nations in cases of legitimate self-defence, of flagrant violation of the demilitarised zone and of attack or flagrant violence.

(d) Germany, France and Belgium, having resolved never more to make war on one another, pledge themselves at the same time by particular Treaties of Arbitration to regulate all their differences by pacific methods, submitting them either to judges or to a commission of conciliation.

(e) Great Britain and Italy guarantee the execution of these obligations by the states concerned.

(f) All rights and obligations arising for the contracting parties out of the Covenant of the League of Nations remain intact, that is to say, all these conventions are included within the framework of the League of Nations and are, strictly speaking, only applications of certain principles and definite articles of the Covenant. These engagements will come into force with Germany's entry into the League of Nations.

These arrangements do not certainly procure complete security for the signatory Powers. But between them they take practically all the precautions which it is humanly possible to take. The only reproach that can be levelled against them is that they interlace the rights derived from the Rhineland Pact and the applications prescribed by the Covenant of the League of Nations to such an extent that it will be sometimes difficult to reconcile the former with the latter. For example, under Article 2 of the Treaty of Guarantee analysed above, France would have the right of invading the territory of Germany immediately if the latter violated Articles 42 and 43 of the treaty or attacked one of the signatory states, especially Poland or Czechoslovakia. It has been expressly stated in the public speeches of the Allied ministers that the demilitarised Rhineland zone could not be a "wall" sheltered behind which Germany could commit aggression against states other than France. Nevertheless, by the terms of Articles 3 and 4, any signatory state which considers that a violation of Article 2 or a contravention of Articles 42 and 43 of the treaty has been committed, ought to bring the question immediately before the Council of the League of Nations. One may wonder whether, in case of a military occupation by Germany or of an unexpected case of aggression by Germany against Poland, France should await the decisions of the Council of the League of Nations before invading German territory. On this question the declarations of the Allied ministers seem to agree that this would not be the case. But the German press appears to take the view that France would be bound to wait.

Further, according to Article 8, the treaty "will remain in force until the Council acting on the request of one or another of the high contracting parties notified to the other signatory Powers three months in advance, and voting at least by a two-thirds majority, decides that the League of Nations ensures sufficient protection to the high contracting parties the treaty shall cease to have effect on the expiration of a period of one year from such decision." It would then be possible for a two-thirds majority of the Council to declare the treaty void and to return to the general guarantees of security stipulated in the Covenant. Finally, the treaty imposes no obligation on any of the British Dominions nor on India. This is why the present complementary agreements are maintained and it is permitted to conclude fresh ones, provided they be communicated to the League of Nations and registered by it.

As for the interpretation of Article 16 of the Covenant, it is defined as follows in the letter addressed to the German Delegation: "The obligations resulting from the said Article on the Members of the League must be understood to mean that each state member of the League is bound to collaborate loyally and effectively, in support of the Covenant and in resistance to any act of aggression to an extent which is compatible with its military situation, and takes its geographical position into account."

## THE TREATIES OF GUARANTEE

Besides the arbitration agreements, two Treaties of Guarantee signed by France with Poland and Czechoslovakia, and communicated at Locarno to the other states represented at the conference, complete the system of security. Their essential arrangements, which are identical in the two treaties, are as follows:—

*Article 1.*—In the event of Czechoslovakia (or Poland as the case may be) or France suffering from a failure to observe the undertakings arrived at this day between them and Germany with a view to the maintenance of general peace, France and reciprocally Czechoslovakia (Poland) acting in application of Article 16 of the Covenant of the League of Nations, undertake to lend each other immediately aid and assistance, if such a failure is accompanied by an unprovoked recourse to arms.

In the event of the Council of the League of Nations, when dealing with a question brought before it in accordance with the said undertakings, being unable to succeed in making its report accepted by all its members, other than the representatives of the parties to the dispute, and in the event of Czechoslovakia (Poland) or France being attacked without provocation, France or reciprocally Czechoslovakia (Poland) acting in application of Article 15, Paragraph 7, of the Covenant of the League of Nations, will immediately lend aid and assistance.

Dr. Benesh, in the exposé made on Oct. 30 to the Permanent Commission of the Czechoslovak Parliament, declared "We must emphasise that the assistance in question would take effect automatically. This means that the (3) contracting states have the full and only right to judge themselves whether they are confronted with a *casus foederis* (that is to say, whether the cases in which Article 15, Paragraph 7, and Article 16 of the Pact of the League of Nations are applicable) and that they are not pledged to wait for the result of any negotiations. Our former treaty with France thus acquires an entirely new character without losing anything of its effectiveness."

*Ratification of the Agreements.*—The principal speeches made in 1925 by the ministers responsible are as follows:—

Mr. Baldwin, Oct. 8, at Bristol, before the annual congress of the Conservative party;

Sir Austen Chamberlain, Nov. 18, in the House of Commons; Count Skrzinski, Nov. 26, before the Committee for Foreign Affairs of the Polish Chamber;

Herr Luther, Oct. 28, at Essen, and Nov. 23 in the Reichstag.

After the two latter speeches, the German Parliament consented to the agreements which, in consequence, were solemnly signed in London on Dec. 1, at a special meeting presided over by Sir Austen Chamberlain. On Dec. 14, in the course of the 37th Session of the council, Sir Austen Chamberlain and M. Paul-Boncour deposited the agreements in the archives of the League of Nations. Speeches were made on this occasion by all members of the council recording warm approval of the great results obtained at Locarno. At the beginning of 1926 what was called the "spirit of Locarno" animated all governments: but certain mistrust and even opposition were apparent in important sections of public opinion of several countries.

This opposition was early voiced. In the French Chamber of Deputies, at the end of Feb. and beginning of March, the plan of ratification of the Locarno Treaties encountered vigorous criticism. Then irreconcilable differences of opinion were manifested in the intentions of the various governments respecting the enlargement of the Council of the League necessitated by Germany's entry. The Assembly was convoked on March 8 1926, to pronounce on Germany's request for admission and sat till March 17, without the council's being able to reach an agreement (the council's decisions must be unanimous); Spain and Brazil demanded that their temporary seats be made permanent, and Poland also demanded a permanent seat. Germany, again, wished no one but herself to receive a new permanent seat. After various agitating moves, Brazil (March 16) maintained her opposition to any combination which did not invest her with a permanent seat. In consequence, the representatives of the signatory states of the treaties of Oct. 16

issued a special declaration in which they declared their adherence to the peace work of Locarno, and the Assembly postponed further examination of the question till the Sept. session. A special commission was appointed to study the whole question of the enlargement of the council by that date.

**BIBLIOGRAPHY.**—*Treaty of Versailles, Treaty between Great Britain and France; Agreement between U.S.A. and France*, both signed on June 23 1919, but not ratified, printed as annexes to the Treaty of Versailles; British Blue Book, *Papers respecting negotiations to an Anglo-French Pact* (Cmd. 2169 of 1924); French Yellow Book, *Documents relatifs aux négociations concernant les garanties de sécurité contre une agression de l'Allemagne* (10 jan. 1919–7 dec. 1923); League of Nations, *Documents A. 35, 1924 IX; A. 35a, 1924 IX; A. 35b, 1924 IX; A. 135 (1) 1924 IX; Annexe (2) a A. 135, 1924 IX*; British White Book, *Final Protocol of the Locarno Conference, 1925* (Cmd. 2525 of 1925); League of Nations, *Journal Officiel* (1921, etc.); A. J. Toynbee, *Survey of International Affairs for 1924*, pp. 1 to 64 (Oxford Univ. Press, 1926). (A. GN.)

**SEDGWICK, ELLERY** (1872– ), American editor and publisher, was born in New York City Feb. 27 1872. He graduated at Harvard University (A.B. 1894) and taught at Groton School, Mass., 1895–6. He was on the editorial staff of the *Worcester Gazette*, 1896, assistant editor of *The Youth's Companion*, 1896–1900, and from 1900 to 1905 was editor of *Leslie's Monthly*, which under his editorship became *The American Magazine*. After a brief connection with *McClure's Magazine* and with D. Appleton and Co., he became editor of the *Atlantic Monthly* and president of the company in 1909. Under his management the circulation was greatly increased and the high character of the magazine maintained. He had published a *Life of Thomas Paine* in 1899.

**SEECKT, HANS VON** (1866– ), German soldier, was born in Schleswig April 22 1866. He entered the Kaiser Alexander Grenadier Regiment as ensign (fahnenjunker). In 1897 he was appointed to the general staff, becoming chief of staff of the III. Army Corps (Berlin) in 1913, in which capacity he went on active service in Aug. 1914, with the rank of lieutenant-colonel. On Jan. 27 1915 he was promoted colonel, and soon after became chief of staff to Mackensen's army group. He had a large share in conducting the break-through of the Central Powers at Gorlice-Tarnow, May 1915, and the subsequent invasion of Serbia. After the collapse of the Monarchy he became adjutant-general (*Chef des Truppenamtes*) in the *Reichswehrministerium* (Nov. 1919). After the Kapp "putsch" of March 1920 he was appointed chief of the German Army Command. In Jan. 1926 he was again promoted to the rank of general by President von Hindenburg.

**SEELY, JOHN EDWARD BERNARD** (1868– ), British politician, born May 31 1868, was the third son of Sir Charles Seely, Bart., a Nottinghamshire coal owner. Educated at Harrow and Trinity College, Cambridge, he became a barrister. In 1900–1 he served with the Imperial Yeomanry in South Africa, winning the D.S.O., and during his absence was returned to Parliament as Conservative M.P. for the Isle of Wight. His later career as a politician was somewhat varied. Forsaking the Conservative party when Mr. Chamberlain introduced his Tariff Reform proposals, Seely was returned to Parliament after the general election of 1906 as Liberal M.P. for a Liverpool division, and in 1908 he took office as under-secretary for the Colonies. In 1911 he was appointed to a similar position at the War Office and in 1912 he succeeded Lord Haldane as Secretary of State for War. He held this position until the Curragh incident in 1914, when, having initialled a demand by certain officers that they should not be asked to serve against Ulster, he was compelled to resign (see ENGLISH HISTORY). During the World War he served on the staff and later commanded a brigade of Canadian cavalry. In 1918–9, having been M.P. for the Ilkeston division of Derbyshire since 1910, he was under-secretary at the Ministry of Munitions, and then under-secretary of state for Air in the Coalition Ministry. In 1923 he again became M.P. for the Isle of Wight, but he lost his seat in 1924. His elder brother, Sir Charles Hilton Seely, died in 1926.

**SEGUR, PIERRE MARIE MAURICE HENRI**, MARQUIS DE (1853–1916), French author (see 24.584), died at Poissy Aug. 13 1916.

**SEIGNOBOS, CHARLES** (1854– ), French historian, was born Sept. 10 1854 at Lamastre (Ardèche). Educated at the Lycée de Tournon, he passed to the École Normale Supérieure. Entrusted with an independent course of historical instruction in 1879 at Dijon, he was appointed to the Sorbonne, first as unattached professor in 1883 and later as special lecturer in 1890. In 1897 appeared his *Histoire politique de l'Europe contemporaine*, which was crowned by the Académie française. His work is distinguished by a broad-minded and often democratic tone, and a grasp of social science which place him in the forefront of modern historical writers.

His other published works include: *Histoire de la civilisation* (1886); *Histoire des anciens peuples de l'Orient* (1890); *La méthode historique appliquée aux sciences sociales* (1901); and in *L'Histoire de France Contemporaine* of E. Lavisse, *La Révolution de 1848* (1921); *Le Second Empire* (1921); *Le Déclin de l'Empire et l'Établissement de la III<sup>e</sup> République* (1921).

**SEIPEL, IGNAZ** (1876– ), Austrian statesman and Roman Catholic priest, was born in Vienna July 19 1876. He did not enter politics until the end of the World War, although he published several books on subjects on the border line between his own subject, moral theology, and political science, social science and economics, viz.: *The Economic Teaching of the Fathers* (1907), *Nation and State* (1916); and in 1917 a pamphlet on the *Reform of the Austrian Constitution*. As professor at Salzburg (1909–12) he saw much of the retired economist, Heinrich Lammasch, with whom he worked until 1917 in the preparation of an edition of the writings of Hugo Grotius on international law.

Seipel was appointed to Vienna University in 1917 and his work, *Nation and State*, dealing with the supernational state, such as the Austro-Hungarian Monarchy, as a higher type of State compared with the national State, and thus viewing Austria-Hungary's future optimistically, at the same time favouring a reasonable pacificism, caused the Emperor Charles to include him in the circle of those men who were to prepare the way for peace through unofficial negotiations abroad. At the same time, the German parties in the Austrian Parliament summoned him as scientific expert to the consultations on the reform of the constitution now recognised as overdue, and in these Seipel supported moderate federalism on a national basis. But the downfall of the Austro-Hungarian Monarchy could not be prevented either by reform of the constitution or by the peace policy of the Lammasch Ministry, which took office at the eleventh hour, in Oct. 1918, and which included Joseph Redlich and Seipel as exponents of the peace policy.

After the collapse, Seipel succeeded in preventing the threatened split of the strongest Conservative party in the country, the Christian Socialist, into a Monarchist and a Republican party. This and the necessity of getting new men into Parliament under the new conditions caused his election in 1919 to the National Constituent assembly by the electoral division for central Vienna, and later to the National Council. As long as the Social Democrats were the strongest party, the Christian Socialists joined it in forming a Government coalition. During this time Seipel worked against too close an alliance of the Christian Socialists with the Social Democrats; in particular he prevented the execution of far-reaching schemes for the socialisation of means of production. After the elections of 1920, which returned the Christian Socialists at the head of the poll, Seipel was undisputed leader of his party. Under his influence Austrian policy gradually veered to the right. In the spring of 1920 he succeeded in creating a firm Governmental majority, which included all non-Marxist parties, and remained in power after the elections of 1923.

As soon as the anti-Socialist united front had been formed, Seipel took over the administration as Chancellor May 31 1922. At that time the universal misery had reached its climax owing to the policy of inflation. Seipel, together with his Ministers of Finance, August Ségur and Victor Kienböck, put an end to inflation by the creation of a new note bank independent of the Government and prepared for his negotiations with the League of Nations in the autumn of 1922 by his political journeys to Prague, Berlin and Verona, by which he obtained the guarantee of a foreign loan by a number of States and eventually the loan

itself. This loan, by covering the deficits which were at first unavoidable, gave time and stimulus for the carrying out of the economics and reforms, necessary to balance the budget. Seipel succeeded by hard fighting in carrying through Parliament the acceptance of the Geneva Protocol and of the foreign controller of Austrian finances appointed by the League of Nations, and led Austrian policy to the re-establishment of almost complete financial equilibrium. In the autumn of 1924, when he had hardly recovered from a wound inflicted in an attempt on his life, he encountered strong opposition in the provinces, *i.e.*, from the members of the Austrian Federation, to his endeavours to introduce a few necessary reforms into the constitution and administration. He then resigned his Chancellorship. After that he carried on active propaganda for a lasting peace through his numerous lecture tours in Austria and abroad. He believed that peace would be secured by recreating the economic unity in Central Europe, which had been destroyed by the War and the inadequate Peace Treaties. His object was a European confederation, which would neither coerce nations for economic reasons nor would violate economics for the sake of national aspirations. (A. F. PR.)

**SEISMOLOGY:** *see* EARTHQUAKES.

**SEITZ, KARL** (1869— ), Austrian politician, was born at Vienna on Sept. 4 1869, the son of a wood merchant. Although apprenticed to the tailoring trade, he subsequently entered the teachers' seminary at St. Pölten, through the medium of patrons. In this way he became an elementary school teacher. Originally inclined to the German National party, he joined in 1888 the Social Democratic party. He organised the Social Democratic teachers of Vienna, and in the diet of Lower Austria waged a fierce fight against Burgomaster Lueger and the dominant Christian Socialist party. Elected to the Austrian *Reichsrat* in 1901 he became after the death of Pernerstorfer, its vice-president down to its dissolution. After the revolution of 1918 he was president of the German-Austrian National Assembly, and subsequently of the national parliament (*Nationalrat*) until the new elections in Oct. 1920, and acting federal president until Nov. 1920. He was in 1921 chairman of the committee of the Social Democratic party and of the parliamentary party, and vice-president of the *Nationalrat*.

**SELBORNE, WILLIAM WALDEGRAVE PALMER, 2ND EARL OF** (1859— ), British politician (*see* 24,599), on his return from South Africa resumed his prominent position among the Conservative leaders in the House of Lords. He took an active share in defending the House against Liberal attack, and was one of the leading "Diehards" who maintained an uncompromising resistance to the Parliament Bill. When the World War came he was largely occupied with his military duties with the 3rd battalion of the Hampshire Regiment; but he joined the first Coalition Ministry in May 1915, as Minister of Agriculture. As minister he appointed an expert agricultural committee under the chairmanship of Lord Milner, to report on the means of maintaining and increasing food production in England and Wales; but he and the Government rejected their recommendation to guarantee farmers a minimum price of 45s. a quarter for four years. In June 1916 he resigned his office because he disapproved of the Irish policy of compromise accepted by Mr. Asquith's Government. He did not join Mr. Lloyd George's Ministry, and after the War was largely conspicuous in ecclesiastical matters; he was forward in promoting the movement of self-government in the Church which culminated in the Church Enabling Act of 1919. He also identified himself strongly with the policy of reforming the House of Lords and reconsidering the relations between the two Houses under the Parliament Act.

His elder son, **VISCOUNT WOLMER** (b. 1887) entered Parliament in 1910, and proved an active member of the Conservative party, as well as a leading member of the Church Assembly. He was made assistant postmaster-general in 1924.

**SELENIUM** (*see* 24,601).—The unrivalled efficiency of selenium as a detector of light has been utilised in several new types of apparatus. The use of selenium as a trigger for actuating a relay, the most striking example of which was the steering of an unmanned boat by a searchlight on shore in 1916, has not

yet been very fruitful in practice. Such problems as the automatic lighting of electric street lamps at dusk have not been solved, on account of the prohibitive cost of the apparatus as compared with human labour. Cox's cable relay, a light relay worked with selenium, and producing a more than thousandfold amplification of submarine signals, may, however, be cited as a successful application of a selenium relay. It works by throwing a beam of light from the galvanometer recording the signals alternately upon two opposed networks of a selenium grating.

**Detectors.**—Among laboratory applications one of the most important is the selenium detector attached to a number of Hilger spectroscopes and monochromatic illuminators. This detector contains a "line-element" of selenium, 2 cm. long and 0.3 mm. wide, made by ruling a shallow groove in a ceramic surface coated with graphite and filling it up with sensitised selenium. Small holes are drilled along the line-element to allow of simultaneous visual observations. The line-element has a resistance of approximately a megohm in the dark. A 30-v. battery is used to produce a deflection in a sensitive galvanometer connected in series with the detector and battery, and the effect of illuminating the line-element is an immediate increase of the deflection. This increase reaches a maximum after a few seconds, and is proportional to the square root of the intensity of illumination. The detector responds to all visible light and also to ultra-violet light down to the limit of the spectrum in air. At the less refrangible end, however, the response of the detector falls off at 6,500 Angström units and ceases entirely at 15,000 units, after covering about an octave of infra-red wave-lengths. Compared with the thermopile, the selenium detector is slightly more efficient in the first region of the infra-red, and very much more efficient in the visible and the ultra-violet regions, where its superiority can be expressed as a factor of several thousand.

**Photometry.**—Another application concerns photometry, where the limit of accuracy of visual comparisons is approximately 1%. This accuracy has now been greatly exceeded even by the photoelectric cell, with which differences as low as  $\frac{1}{100}$ % can be registered. In the case of selenium the limit of accuracy is  $\frac{1}{100}$ % or even less. Here, again the superiority of selenium is more marked in feeble light than in strong light, since strong illumination brings the conductivity near a point of "saturation."

**Amplifiers.**—Several methods have been devised for amplifying the photoelectric action of selenium by means of the thermionic valve. Selenium being capable of responding measurably to a light-stimulus less than  $\frac{1}{100,000}$  of a sec. in duration, it is worth while to amplify the effect into a practically useful current impulse. This can be done by making it alter the potential of the grid of a valve. G. G. Blake has devised a number of circuits in which this is done. In some of these circuits the effect of light on selenium is made to change the pitch of a circuit in audio-frequency oscillation, thus producing an audible effect of light on a principle different from that of the optophone. Another method of utilising selenium has been developed by E. O. Symonds, who uses a five-valve amplifier for recording the passage of Fabry-Pérot interference fringes by means of a selenium detector and a Creed relay and undulator.

This device was first shown in action at the Optical Convention in April 1926, where it recorded Fabry-Pérot fringes at the rate of three per sec., working continuously for several hours.

**X-rays.**—These X-rays increase the conductivity of sensitised selenium. A well-known apparatus for utilising this action for the dosage of X-rays is that of Fürstenau, but it is only suitable for the less penetrating rays, as rays of the shorter wave-lengths are insufficiently absorbed to produce a measurable effect. This may be remedied by using thicker layers of selenium capable of absorbing the most penetrating rays and indicating the distribution of their intensity along the spectrum. Researches in this direction have been undertaken at the London Cancer Hospital.

**SELF-DETERMINATION** is a term which, since the World War has been commonly used to denote the right of every people to determine and to direct its political and spiritual destinies; that is, to choose freely such form of government and of political and cultural institutions as it thinks will best correspond to its needs and express its distinctive national genius. In the past it had been applied to a variety of political and other causes. After 1914 it became a war-time slogan, chiefly used by Allied propagandists who represented it as part of the Allied programme to liberate certain subject nationalities of Eastern, Central, Southeastern Europe and of the Middle East, from the control of the races there dominant. In particular the term was associated with the Baltic nations and the subject nationalities of Central and Southeastern Europe. After the Russian Revolution of March 1917, Kerensky proclaimed it as one of his cardinal principles. President Wilson was one of its chief advocates, and included it in his famous Fourteen Points enunciated in 1918. The effect which it has had in practice on international affairs in the period 1914-26 must be gauged by a study of war-time and post-War diplomacy. (See EUROPE; PLEBISCITE; those on the various European countries e.g. POLAND; RUMANIA.)

**SELFPRIDGE, HARRY GORDON** (1864- ), American business man, was born at Ripon, Wisconsin, U.S.A., on Jan. 11 1864. Educated at the public school, Jackson, Mich., U.S.A.; he afterwards entered the firm of Marshall Field and Co., of Chicago, from which he retired in 1904. In 1906 he went to London and organised the firm of Selfridge and Co., Ltd., wholesale and retail merchants, which opened in 1909 with extensive premises in Oxford Street. These became known throughout the country, and the firm developed into one of the most successful business enterprises of its kind in the world. Mr. Selfridge wrote a book, *The Romance of Commerce* (1918) in which he attempted to record the growth of commerce from the earliest times until the present day.

**SELOUS, FREDERICK COURTNEY** (1851-1917), British explorer (see 24.614), during the World War served in the East African campaign in the legion of frontiersmen (25th Fusiliers). He was promoted captain and in Sept. 1916 was awarded the D.S.O. He was killed in action at Beho Beho Jan. 4 1917. His private collection of trophies was given by his widow to the Natural History Museum, London, where in June 1920 a national memorial to him was unveiled. A Selous scholarship was also founded at his old school, Rugby. See J. G. Millais, *Life of Frederick Courtney Selous* (1918), and *Geog. Jour.*, vol. 49 (1917).

**SEMBAT, MARCEL** (1862-1922), French politician, was born Oct. 19 1862, at Bonnières (Seine-et-Oise), and educated at the Collège Stanislas. In 1893 he became Socialist deputy for the 18th arrondissement of Paris, and attached himself to the Blanquist fraction of the party headed by Edouard Vaillant. On the constitution of the United Socialist party, however, in 1905, under Jaurès, the factions previously opposed to him under the banners of Blanqui and Jules Guesde were merged in it, and Sembat became one of a brilliant body of extremist debaters which for many years made the Radical-Socialist party the strongest political force in France. He sat for many years on the Budget and Foreign Affairs committees of the Chamber. He gained a reputation not only as a caustic and alert debater, but as a journalist; previous to the formation of the United Socialist party, he contributed to the *Petite République* and *La Lanterne* and when Jaurès founded *L'Humanité* in 1904, became one of its best-known correspondents.

On the outbreak of the World War, Sembat, who had originally been opposed to Socialists taking ministerial office, was one of many members of his party who sank their party grievances in the Union Sacrée, and himself became Minister of Public Works in the Ministry of National defence in Aug. 1914. After the War, Sembat stood out in his resistance to the insidious doctrines of Communism, and saw the United Socialist party broken up by disputes such as those at the Tours Conference of 1920 on the question of adherence to the Third International. But though he had always kept up relations with certain bourgeois elements of the Left, he had not, up to the time of his death at Chamonix on

Sept. 5 1922, seen fit to modify his opinions except in a sense even more favourable to pure Socialism. Among his published works are *Matisse et son oeuvre* (1920) and *La victoire en déroute* (Eng. tr. 1925).

**SENEGAL**, a colony and protectorate of French West Africa (see 24.640). The area is 74,000 sq. m. and the population (1925) about 1,500,000. The capital is St. Louis, with a population (1921) of 18,117. In Dakar (32,440) Senegal possesses the largest town, and the only first-class port in French West Africa. A railway (682 m. long) from Thies, on the Dakar-St. Louis line, was completed to Kayes, on the Senegal river, in 1923. At Kayes, this line joins the railway to Kulikono on the navigable Niger. Immense quantities of ground nuts are grown by the natives and form the bulk of the country's trade. The amount exported annually, over the period 1910-24, being from 250,000 to 300,000 tons. The colony of Upper Senegal and Niger was renamed French Sudan in 1920.

**SENUSSI** (see 24.649).—By 1914 the dominating influence which the Senussi brotherhood had formerly possessed in the region between Lake Chad and Darfur had been lost by the conquest by the French of Wadai and the other States of the Central Sudan. While members of the sect were to be found from Morocco to Afghanistan, and there had been an increase of its adherents in Egypt and Arabia, the temporal authority of the Senussi was then confined to Cyrenaica and the oases of the Libyan Desert—Kufara, Jalo, Jaghub, etc.

The Senussi Sheikh, Sayed (Sidi) Ahmed esh Sherif, had been won over some years previously to Pan-Islamism and he had aided the Turks in 1911-2 in their campaign against the Italian invaders of Cyrenaica. After the Treaty of Lausanne Sayed Ahmed continued the war with Italy. Terms of accommodation might have been reached but the Sheikh refused to accept the position of a "protected Bey." He had effective control of the greater part of Cyrenaica when the World War began.

In 1915, partly as the result of heavy bribes and gross flattery, Sayed Ahmed was induced by Turkish and German agents to break the friendly relations which had hitherto existed between the Senussi and Egypt, and at the end of that year he invaded western Egypt. (For the military operations see SENUSSI, OPERATIONS AGAINST THE.)

The war with Egypt had not the approval of all the Senussi chiefs. Notably it was opposed by Sayed Mohammed el Idris the eldest son of the Sheikh el Mahdi, the second head of the Senussi fraternity. When Senussi el Mahdi died in 1902 his sons were minors and the chieftainship had gone to his nephew Ahmed. With Sayed Idris the Italian and British Governments entered into an agreement in 1917; the Senussi chiefs acknowledged Sayed Idris as "Grand Senussi" and in Aug. 1918 the defeated and discredited Sayed Ahmed found it convenient to quit Cyrenaica. He was conveyed by a German submarine from Misurata to Pola, whence he went to Turkey, still claiming to be head of the brotherhood. By the Accord of Regima, Nov. 1920, Sayed Idris acknowledged Italian suzerainty. He was given the hereditary title of emir (prince) with jurisdiction over the oases of Kufara, Jaghub, Jalo, Aujala and Jedabia.

*Italian Occupation of Jaghub.*—Peaceful relations continued for some time, but Italy under Fascist rule found the situation irksome. There was also evidence that Sayed Idris was encouraging the insurgents in Tripolitania, who in July 1922 had invited him to become their leader and prince. "In the beginning of 1923, it being considered that the terms of these agreements [with the Senussi] and the manner in which they were interpreted on the native side were incompatible with the national dignity [of Italy] they were denounced, and since that date the tableland [of Cyrenaica] has been the site of desultory political brigandage and occasional raids on cattle and crops by groups of tribes." This quotation from a report by Mr. L. H. Hurst, British consul at Benghazi, summed up the situation in Sept. 1923. Six months later armed opposition to the Italians was confined to the Jebel el Akhdar, to the east of Benghazi. Sayed Idris himself had in Jan. 1923 withdrawn to Egypt where he had formerly resided as Senussi envoy. Seemingly he suffered no loss of spiritual prestige, upon which his friends declared he set more store than on

temporal authority. In the Libyan oases his lieutenants continued to rule.

The Italians, however, were placed in an advantageous position to control Senussi activity by an agreement made with Egypt on Dec. 6 1925. This agreement gave them the sovereignty over the oases of Jaghbug, while south of that place the frontier was drawn along the 25th degree of E. longitude, thus including Kufara in Cyrenaica. Jaghbug was occupied by Italian troops in Feb. 1926, without opposition. It is important as containing the tomb-mosque of the founder of the Senussi sect and a *zawiya* (monastery) for the training of the *ikhwan* (brethren). It is also on the route from Kufara to Egypt and has some strategic value. The Italians agreed to respect the holy places at Jaghbug and to allow Moslems free access to them. With the Senussi as a religious order they declared that they had no quarrel. During 1920-3 Mrs. Rosita Forbes, Hassanein Bey and M. de Laborie all penetrated to Kufara and each drew a pleasing picture of Senussi culture and Senussi rule in the Libyan oases. (See AFRICA.)

(F. R. C.)

**SENUSSI, OPERATIONS AGAINST THE.**—The military activity of the Senussi from 1900 to 1910 had been directed against the French in the regions between Lake Chad and the Nile Basin. There was evidence of an increase of adherents to the sect in Egypt and Arabia; in N.W. Africa and the Sudan it had made practically no headway. During 1911 the Senussi Sheikh, Sidi Ahmed, aided the Turks in their campaign against Italy in Cyrenaica. After the treaty of Lausanne, in Oct. 1912, by which Turkey agreed to evacuate Tripoli and Cyrenaica, Sidi Ahmed continued the war against the Italians, who were powerless to penetrate into the interior.

**Outbreak of War.**—In 1914, the Germans and Turks saw in the Senussi a powerful instrument for attacking the British position in Egypt and the Sudan. For long Sidi Ahmed resisted the efforts to embroil him with Egypt, with which he had always maintained good relations. But the adherence of his enemy, Italy, to the Allied cause in May 1915 gave his Turkish advisers a powerful lever and finally the influence of Nuri Bey, a half brother of Enver, prevailed.

The plan instigated by the Turks and Germans was for simultaneous advances on Egypt along the coastal strip and by the oases leading from Siwa to the Nile. At the same time the Sultan of Darfur was to rise, invade Kordofan and advance on Khartoum. The danger to the British in Egypt and the Sudan was not so much in the military force actually at the command of Sidi Ahmed and his allies as in the spiritual authority he exercised and the possibility of a religious rising.

Hostilities began on Nov. 15 1915. The small garrisons of Es Sollum and other advanced posts were withdrawn, and Mersa Matruh was made the base for the British operations. The difficulty was to collect a sufficient force, for during the Gallipoli operations Egypt had been practically denuded of troops. The force assembled under Maj.-Gen. A. Wallace consisted of Yeomanry, Territorials, Australians, New Zealanders, Indians and Egyptians. The Senussi leader had a few Turkish troops with him, about 5,000 of his own regular forces and a varying number of irregular tribesmen.

**A Decisive Engagement.**—Gen. Wallace succeeded in striking a severe blow at the enemy on Christmas Day 1915, but the rainy season and a lack of troops and transport prevented any further attempt to bring the enemy to battle till Feb. 1916. On Feb. 20, Maj.-Gen. W. E. Peyton, who had succeeded Gen. Wallace, began an advance to reoccupy Es Sollum. On Feb. 26 at Agagya, about half way to Es Sollum, a decisive engagement was fought. The infantry, which included two South

African battalions, captured the Senussites' position. In the pursuit the Dorset Yeomanry, by a fine charge, broke the enemy and captured Jafar Pasha, an able Baghdadi Arab who commanded the Senussites. There was little further fighting. Es Sollum was reoccupied on March 14, the enemy retiring into Cyrenaica. During Feb. and April 1916, the Senussites, under Sidi Ahmed himself, occupied the Bahariya, Farafra, Dakhla and Kharga oases, but made no further advance. The British had at the time no forces available for re-occupation, but kept the oases under observation by aeroplane.

Meanwhile the rebellious Sultan of Darfur, Ali Dinar, in May 1916, was attacked and defeated by a force from the Sudan under Lieut.-Col. P. V. Kelly. The Sultan himself was killed in November. By Oct. 1916 the British had organised a camel corps and light car patrols, and proceeded to re-occupy the oases. Sidi Ahmed retired to Siwa, where he was attacked and defeated at the beginning of Feb. 1917 by a force of armoured cars from Es Sollum under Brig.-Gen. H. W. Hodgson. This action at Siwa discredited the Senussi and removed the danger to Egypt.

During 1917 and 1918 Turkish and German influence amongst the Senussites declined and Sidi Ahmed's own position was discredited. In the summer of 1918 he found it advisable to leave Cyrenaica for Turkey and was succeeded by Sidi Mohammed el Idris, the son of Senussi-el-Mahdi. The new Grand Senussi concluded agreements with Great Britain and Italy, recognising Italian sovereignty. In 1925 a rectification of frontier was made between Egypt and Italy, Jaghbug being transferred to the Italian sphere.

**SERBIA** (see **SERVIA**, 24.686), until 1918 an independent kingdom of southeastern Europe. Since that date it has formed part of the Serb-Croat-Slovene kingdom (Yugoslavia). For its present area, population and economic and financial history and for its political history after 1918, see **YUGOSLAVIA**.

### I. THE BALKAN LEAGUE

The annexation of Bosnia (Oct. 13 1908) marked a turning-point in the history of Serbia. Henceforth public opinion, supported by prominent statesmen in every party, was practically unanimous in regarding a conflict with Austria-Hungary as sooner or later inevitable. This belief had at once a national and an economic basis; for Count Aehrenthal not merely supported the Hungarian policy of repressing Yugoslav national aspirations inside the Dual Monarchy, but obstructed Serbia's commercial development by tariff and frontier restrictions, by a veto upon either direct access to the sea or a common frontier with Montenegro and by opposition to all idea of Balkan co-operation.

Aehrenthal's policy inevitably strengthened the tendencies towards the creation of a Balkan League, and these were accelerated by the political unrest evoked throughout the Balkan peninsula by the Young Turk revolution. At first the inclusion of Turkey in such a league was openly advocated by Izvolsky, the Russian Foreign Minister, and was actively favoured by Milovanović and Veniselos. But in view of the increasingly chauvinistic attitude of the Young Turk régime in Macedonia and Albania, Veniselos found it advisable to discuss with Bulgaria measures of common defence against a possible Turkish attack; and this was followed in the winter of 1912 by negotiations between Sofia and Belgrade. On March 13 1912 a secret treaty of alliance was concluded between Serbia and Bulgaria, and was supplemented on May 12 by a military convention. On May 29 a similar treaty was concluded between Bulgaria and Greece. There was no actual treaty binding Serbia and Greece, while the Serbo-Montenegrin treaty, concluded as late as Sept. 1912, was less political than military, and provided for separate though parallel action.

By the first of these each State was bound to assist the other with all its forces in the event of an attack, and in particular in the event of any Great Power trying to annex any portion of

Turkey's Balkan possessions. If internal troubles should arise in Turkey, either ally might initiate proposals for military action, and any point upon which agreement was not reached should then be referred to Russia for decision. Special provision was made for possible conquests, Serbia recognising Bulgaria's rights over the territory lying east of the Rhodope mountains and the Struma river, and Bulgaria similarly recognising Serbia's rights north and west of the Šar mountains. The districts lying between these limits, the Aegean and the Lake of Ohrida were to form "a distinct autonomous province," but should their partition prove inevitable, then Serbia undertook to make no claim beyond a line drawn from the Lake of Ohrida to near Kriva Palanka on the old Turco-Bulgarian frontier and including Skopje, but not Monastir, Prilep or Veles. In the event of a dispute the Tsar was to act as arbitrator, and Bulgaria undertook to accept the more southerly line as its new frontier with Serbia if the Tsar should decide in its favour. In the event of war Bulgaria undertook to place at least 200,000, Serbia at least 150,000 men in the field against Turkey. If either Turkey or Rumania attacked Bulgaria, Serbia was to send 100,000 men to her aid, while she on her part must provide 200,000 men in support of Serbia in the event of an attack by Austria-Hungary.

Internal disorder spread rapidly throughout Turkey-in-Europe in the year following Italy's invasion of Tripoli; and the ferocious policy of suppression adopted by the Committee of Union and Progress towards all the non-Turkish nationalities culminated in a reign of terror at the parliamentary elections of 1912, in a recrudescence of Komitadji activities and in a fresh Albanian rising. The premature death of Milovanović on July 1 not merely deprived Serbia of her ablest modern statesman, but removed one of the few restraining influences in any Balkan capital. He was succeeded as Premier by Trifković and in the conduct of foreign affairs by the Old Radical leader Pašić (Pashitch), who placed almost unreserved reliance on Russian support and worked in the closest accord with Hartwig. On Sept. 12 Pašić became Premier at the head of a purely Old Radical Cabinet.

By this time not even the most pacific statesmanship could have arrested the growing anarchy in Turkey. Public opinion in Belgrade and Sofia was roused by a massacre of Bulgarians at Kočana on Aug. 1, and by the report of similar outrages in the Sanjak. By the middle of the month Usküb, and the entire district recognised by the secret treaty as Serbian, were in the hands of the insurgent Albanians; and the concessions granted by the Porte while failing to arrest the movement only served as an incentive to swift action on the part of the neighbouring States.

The somewhat vague proposals for decentralisation and administrative reform put forward by Count Berchtold on Aug. 20 prompted the Balkan Allies to hasten their preparations. While the slow-moving Concert of Europe was discussing alternative proposals for Turkish reform, the Porte suddenly held up Serbian war material at Salonika and began to mass troops round Adrianople. Before any collective step had been taken by the Powers, the situation was gravely compromised by the almost simultaneous mobilisation of the four Balkan allies (Oct. 1). At the last moment the Porte announced its intention to enforce the Vilayet Law of 1880, which had been allowed to remain on paper for a whole generation. But this was very naturally regarded by the Balkan allies merely as a fresh attempt at evasion, and the Powers still further alarmed them by addressing a conciliatory Note to Constantinople and by simultaneously warning the Allies that even in the event of their victory no change in the territorial *status quo* would be tolerated. The further announcement of the Powers' intention after a lapse of 34 years to enforce the Treaty of Berlin decided the four allies to precipitate events, and before the impending Note could be formally communicated the King of Montenegro, by an act of undoubted collusion, declared war upon Turkey. On Oct. 13 the other three Balkan Governments presented to the Porte a series of far-reaching demands, culminating in racial autonomy for all the nationalities of the Ottoman Empire; and four days later the Turks, without even deigning to answer the note, declared war on Serbia and Bulgaria (*see BALKAN WARS*).

## II. THE BALKAN WARS

*The First War.*—All the Great Powers, though for quite divergent reasons, genuinely attempted to prevent war. That, having failed to do so, they adopted a passive attitude during its early stages, was due to the almost universal assumption in official circles that the Turks would be victorious, and that the refractory Balkan States would soon be only too glad to accept a settlement dictated from without.

The rapid and overwhelming success of the allies radically transformed the situation. By the end of Nov. Turkish rule in Europe was restricted to the Chatalja lines, the Gallipoli Peninsula and the three fortresses of Adrianople, Janina and Scutari. The Serbs in particular, after the victories of Kumanovo and Monastir, were in actual occupation of all Macedonia west of the Vardar and had reached the Adriatic at Durazzo and Medua. They were thus able to go far beyond their obligations under the military convention by sending a force of 47,000 men and heavy siege guns to the assistance of the Bulgarian Army investing Adrianople.

Kumanovo was much more than an ordinary victory. It restored to Serbia that self-confidence which had been so gravely shaken by the rebuffs and scandals of the previous 30 years; and throughout the Yugoslav provinces of Austria-Hungary it was hailed as an atonement for Serbia's downfall on the field of Kosovo and as a pledge of her new mission as the Southern Slav Piedmont.

Austria-Hungary at first adopted a waiting attitude, but as the Serbs approached the Adriatic she suddenly ordered a general mobilisation, and suppressed all public expressions of feeling, while the official press of Vienna and Budapest adopted a menacing tone towards Serbia. Great prominence was given to the alleged insults offered to Prochaska, Austro-Hungarian Consul at Prizren, and for some weeks public opinion was allowed to believe that he had been shamefully mutilated by Serbian officers. It only transpired at a much later date that Prochaska, known to be in touch with the open enemies of Serbia in the Sanjak, had been entirely unmolested by the invaders, but that on the other hand he had received definite instructions from Vienna to create an "incident" such as might provide a pretext for action. The Austro-Hungarian Chief of Staff and War Minister, Generals Conrad and Auffenberg, are known to have favoured a radical solution of the Southern Slav question by immediate war with Serbia; and similar views were held by the leading Ballplatz officials, Macchio, Kanya and the notorious Count Forgács. But both the Emperor and Francis Ferdinand were averse to war, and Germany, finding Italy restive as to any change in the Balkan *status quo*, exercised a moderating influence over Vienna in connection with the fourth renewal of the Triple Alliance (Dec. 7).

Meanwhile, the success of the Balkan allies, and the general relief with which public opinion hailed the downfall of Turkish rule in Europe, led the Powers to accept the accomplished fact and consent to a remaking of the map of Eastern Europe. For the moment all that Berchtold could do was to encourage Bulgarian designs on Constantinople and attempt to sow dissensions among the allies. The Turks, seeing themselves isolated in Europe, made overtures of peace as early as the 11th to King Ferdinand, who was not willing to consider them until his troops had been checked before Chatalja.

*The Conference of London.*—On the 25th, however, negotiations were opened, and resulted, not in peace, but in an armistice (Dec. 3) pending a general peace conference. When this opened in London on Dec. 16, Serbia was represented by the ex-Premier and historian Novaković, the President of the Skupština Nikolić, and the Minister in Paris Vesnić. At London Turkey pursued a policy of dilatory diplomatic intrigue, and only receded inch by inch before the very drastic demands of the Allies. After a month of fruitless negotiations, complicated by a revolution in Constantinople, the Balkan Delegates broke off the negotiations on Jan. 28. The Council of Ambassadors initiated by Sir Edward Grey continued to sit in London, and devoted especial attention to the Albanian problem and to the friction produced between Albanians and Serbs by the latter's presence on the Adriatic.

The commandant of Scutari, Hassan Riza, having declined to recognise the armistice, hostilities before the town had continued throughout Dec. and Jan., and Serbia sent repeated reinforcements to the aid of the Montenegrins.

When war was resumed on Feb. 3 the brunt fell upon Bulgaria, and the Serbs, being complete masters of Macedonia, were free to contribute 47,000 men and a siege train of 38 guns to the operations against Adrianople, which held out until March 26. The dispute which arose as to whether Shukri Pasha had surrendered to the Bulgarians or to the Serbs was in itself quite unprofitable but was a symptom of the friction which was daily increasing between the two allies. The final phase of the war concentrated round Scutari, which Montenegro and Serbia made desperate efforts to reduce. Even the announcement that the Council of Ambassadors, in fixing the frontiers of the new Albanian State, had definitely included Scutari (while leaving Dibra, Prizren, Peć and Djakovica to the two Serb kingdoms) only served as an incentive to create if possible a fresh *fait accompli*. But Austria-Hungary upheld her veto, and on March 20 addressed a severe Note to Montenegro, reproaching her with the murder of a Bosnian Franciscan and other incidents, and dispatched a strong naval squadron to the Southern Adriatic. Realising the danger of Austro-Hungarian intervention, the Powers on March 31 joined Vienna in ordering Montenegro to cease hostilities, and on her refusal established a naval blockade of her strip of coast. This seemingly illusory measure at least had the effect of restraining Austria-Hungary, who could not act separately so long as the Powers held together. It was, however, simply defied by King Nicholas, who gained time by consenting to the withdrawal of the Serbian troops, and meanwhile closed the frontier and conducted secret negotiations with Essad Pasha, commandant of the town since the assassination of Hassan Riza on March 30. On April 23 Scutari surrendered to the Montenegrins, but the Powers, after a crisis of some weeks, eventually compelled the Montenegrins to surrender Scutari to Admiral Burney, as commander of the international fleet.

Negotiations could now be resumed in London for a general peace May 20, and the Powers found it easier to take a strong line. Before the delegates could be brought to business, it was necessary for Sir E. Grey to inform them, with quite undiplomatic bluntness, that unless they were prepared to conclude peace without further delay they had better leave London altogether. By the Treaty of London (May 30 1913) Turkey ceded to the four allies conjointly the island of Crete and all territory lying to the west of the Enos-Midia line, while the settlement of Albania and the Aegean Islands was referred to the Great Powers.

*The Dispute between the Allies.*—The Balkan allies were now faced by the thorny problem of dividing the spoils. Macedonian autonomy, which the treaty had laid down as the ideal solution, was from the first abandoned by all parties. Their success, as it had far exceeded their expectations, also increased their appetites and encouraged them to extend their claims. The four governments seemed each bent upon annexing a maximum of territory, and thus too often became the tools of Powers whose ambitious plans of political and military equilibrium they had unconsciously upset. Above all, the long delays in restoring peace stabilised the various régimes of occupation and proved fatal to mutual understanding. Between Bulgaria and Greece there was no territorial bargain, and no obvious means of reaching one, while Serbia as early as Jan. 23 formally raised the question of a revision of the Serbo-Bulgarian treaty. This rested on the argument that Serbia was entitled to compensation for four reasons: (1) that she had furnished her ally with military support far in excess of her bargain; (2) that she had absolved Bulgaria from her military obligations in Macedonia; (3) that she had loyally continued the war three months after her own work was done; and (4) that the acquisition of Adrianople by Bulgaria radically modified the basis upon which the bargain rested.

But if Serbia's attitude is to be justified, it must be on the broader ground that events had transformed the situation still further to her disadvantage in another direction. Her two parallel aims in the war had been the political liberation of her kins-

men under Turkish rule, and her own economic emancipation by means of free access to the sea; and from the practical rather than the sentimental standpoint the second was much the more vital. Her whole calculation centred upon securing the Sanjak and Kosovo and a link with Montenegro, and a port in Northern Albania: and when Austria-Hungary imposed her veto upon the latter, the Vardar valley became Serbia's only possible alternative outlet, and this involved her retention of Veles, Prilep, Monastir and Ohrida as well as the "disputed zone." Bulgaria on her side, insisted on the literal interpretation of the treaty; and showed herself indifferent to Serbia's difficulties on the west.

Meanwhile Russia strained every effort to avert a conflict, Sazonov going so far as to express regret at the Serbo-Greek negotiations (April 17), while warning Bulgaria of possible danger from Rumania, in the event of aggression against Serbia (April 28). On April 30 the Russian Ministers in Sofia and Belgrade simultaneously reminded the two allies of their obligation to submit disputes to Russian arbitration. But Sazonov's success in settling the Bulgaro-Rumanian frontier dispute had only served to render Sofia more unyielding, and on May 19 the Bulgarian commander-in-chief wrote to the Premier assuming war with Serbia and Greece to be inevitable, and urging concentration against the former. The pressure very rightly brought to bear by Sir Edward Grey upon the peace delegates in favour of the Treaty of London was misinterpreted by the Bulgarians (who alone had any motive for haste) as a guarantee of that treaty against Turkey, and as dispensing them from the need of guarding their eastern frontier.

They were still further encouraged by the openly Serbophobic tone which was taken by the official press in Vienna and Budapest; and King Ferdinand had already ordered General Savov to hasten the transference of the army from the Thracian to the Macedonian front, when on May 27 Pašić, under pressure from the Serbian Opposition, publicly committed his Government to the demand for treaty revision. This hastened the resignation of the pacific Gueschoff, behind whose back King Ferdinand was already concerting aggressive action. His successor Danev opposed the suggestion that the Premiers should meet at Petersburg, contended that Russia had already prejudged the case by even considering revision, and relied increasingly upon Austria-Hungary. Serbia and Greece on their part were fully alive to the danger; and concluded first a military convention, and then a definite treaty of alliance for ten years (June 1). While the first of these provided for mutual military support in case of a Bulgarian attack upon either ally, the second extended the *casus foederis* to an attack by a third Power, "in circumstances envisaged by the treaty of alliance between Greece and Serbia." Both the wording and the events of the moment make it clear that the intention was to guard against an Austro-Hungarian attack upon Serbia. In 1913 King Constantine took this risk, in 1915 he was to deny its application.

On June 8 the Tsar addressed a personal appeal to the kings of Serbia and Bulgaria, which closed with the warning that "the first to make war would be responsible before the Slav Cause." King Peter's courteous though somewhat ambiguous answer was never published; but that of King Ferdinand, which threw the entire blame upon Serbia and argued that the Bulgarian claim had long been admitted by Russia, was a fresh blow to the cause of peace. On June 13 Bulgaria rejected the proposal of the Powers in favour of parallel demobilisation, and her attitude stiffened still further after the speech of the new Hungarian premier, Count Tisza, who emphasised the right of the Balkan States to settle differences in their own way—even by war—and declared that Austria-Hungary could not allow any other Power to acquire special prerogatives in the Peninsula. (June 19).

Danev, rejecting Russia's fresh proposals for a compromise, reiterated the demand for the joint occupation of Macedonia, and added a virtual ultimatum giving Russia a week in which to pronounce an arbiter and 48 hours to announce compliance with the request. With Sazonov's sharp reply bidding Bulgaria to expect nothing more from Russia, St. Petersburg's influence over Sofia may be said to have ended. Count Tarnowski, the Austro-

Hungarian Minister in Sofia, was supreme in the counsels of King Ferdinand during the critical fortnight that followed. The deadlock was complete, when on June 22 the Serbian Cabinet was driven to resign, owing to the resentment of the military party at its alleged moderation. The most it could do was to place itself unreservedly in Russia's hands, and when this was endorsed by the Skupština, after a stormy secret session, Pašić resumed office (June 26). But Russia was by this time powerless to avert the catastrophe.

*The Second War.*—On the night of June 29, without previous declaration of war, the Bulgarian armies made an almost simultaneous attack upon the Serbs and Greeks, hoping by a sudden shock to drive a wedge between the two, seize the coveted districts of Macedonia and then hold them until the foreign intervention which King Ferdinand believed to be imminent settled the dispute on a basis of *beati possidentes*. This is borne out, not merely by captured dispatches, but by the amazing fact that when Putnik's forces everywhere held their own, Savov on July 1 telegraphed the order to stop hostilities. But the war so lightly begun could no longer be stopped. That afternoon the Serbian counter-offensive opened, and a proclamation of King Peter, prepared some weeks previously in Belgrade, with a blank space for insertion of the date, was issued to the troops. After a desperate struggle of nine days on the Bregalnica front (July 1-9), the Bulgarians found themselves cut into two by the inaccessible Plaškovića Planina, and were obliged not merely to relax their hold upon the Vardar valley at Krivolak, but to abandon the whole Ovčepolje, the strategic key to central Macedonia.

It appears certain that the original attack took place without the knowledge of the Danev Cabinet and contrary to its unanimous decision.<sup>1</sup> But that the Premier was contemplating war at an early date is shown by his request that Vienna should ascertain whether the Turtucaia-Balčic line would buy Rumania's neutrality (June 28), and by his warning to the Rumanian Minister that Serbian resistance would be over before Rumania could complete her mobilisation (July 1).

*The Treaty of Bucharest.*—By July 17 the Serbs had forced back the Bulgarians at all points to the frontier of 1912, and could henceforth adopt a mainly defensive attitude; but on July 19 Rumania declared war and began to throw troops across the Danube, while on July 15 the Porte repudiated the provisions of the Treaty of London and ordered Enver Pasha to advance upon Adrianople. The frantic appeals of Sofia to the Powers to enforce upon Turkey respect for a treaty concluded under their auspices were disregarded; and Western public opinion was not inclined to save Bulgaria from the consequences of her own act. At the same time the entry of the two new combatants greatly complicated Austria-Hungary's designs of intervention. She was held back by both her allies—Italy, who viewed with alarm the Balkan activities of any outside Power and was determined to insist upon compensation, and Germany, who feared the loss of Rumania for the Triple Alliance and the consequent derangement of the military balance in Europe. William II. was further influenced by a triple personal motive—the appeal of his brother-in-law King Constantine, old friendship for King Charles and active dislike for King Ferdinand. This momentary divergence of view between Vienna and Berlin sealed Bulgaria's fate; though Vienna and St. Petersburg united to hold back Rumania from occupying Sofia or claiming the Ruščuk-Varna line. Bulgaria had no course left but to sign an armistice on July 31 and to open peace negotiations at Bucharest with her four Christian neighbours. This apparent emancipation of the smaller Powers from the European Concert's control decided Austria-Hungary in favour of belated action against Serbia. But on Aug. 9 the Italian Govt. made it clear to Vienna that it would not recognise the *casus foederis* of the Triple Alliance as applicable to such a case;<sup>2</sup> and the combined pressure of Rome and Berlin, coupled with the certainty of Russian aid to Serbia, again averted war at the last moment.

The Treaty of Bucharest, signed on Aug. 10, assigned to Rumania the Turtucaia-Balčic line, deprived Bulgaria of almost all her conquests in Macedonia and left her to settle the fate of Thrace as best she could with Turkey. Serbia acquired all Macedonia to the west of the Vardar, and to the east the districts of Štip (Istib) and Kočana; but at the last moment Bulgaria was left in possession of a dangerous salient at Strumnica, which enabled her to threaten Serbia's only railway connection with the Aegean. The new Serbo-Greek frontier had already been fixed by mutual agreement, and ran from Gjevgjeli (30 m. north of Salonika) to the S.E. corner of the Lake of Ohrida, leaving Florina and most of the Monastir-Salonika railway to the Greeks. The Treaty of Constantinople, which was concluded between Bulgaria and Turkey Sept. 29 and deprived the former of the greater part of Thrace, did not directly concern Serbia; but the indifference shown by her and her new allies, and still more by Britain and Russia, to Turkey's violation of a treaty which was their joint work, and indeed was morally binding upon them, was to be dearly paid for by Bulgaria's attitude in the World War. The treaties mark a new orientation in the Near East. Slav co-operation is replaced by mutual hatred, which promptly throws defeated Bulgaria into the arms of Turkey and predisposes both for an alliance with Berlin; Rumania's ties with the Triple Alliance are sensibly loosened, while Greece is drawn in two directions by dynastic attractions and party rancours. The military balance had undoubtedly been altered to the disadvantage of the Triple Alliance, yet it was to William II. that King Charles addressed a cordial telegram on the conclusion of peace, "which, thanks to you, remains definitive," and it was to the joint efforts of France and Germany that Greece owed Kavalla.

### III. APPROACH OF THE WORLD WAR

*The Albanian Conflicts.*—Austria-Hungary now concentrated her attention upon Albania, and thereby rendered still more acute the relations between Serbs and Albanians. In the past three decades the latter had been rapidly ousting the former from the historic territories of Kosovo, Prizren and Dečani, and now tried to justify present possession by a claim as autochthonous owners of the soil. The mountainous and inaccessible character of these borderlands and the extreme backwardness of their population made a guerilla warfare almost inevitable; and the summons addressed to Belgrade by the Great Powers for the withdrawal of the Serbian troops (Aug. 19) was a signal for further trouble. Late in Sept. there was a formidable Albanian rising, and the insurgents, aided by numerous bands from beyond the frontier and armed with foreign rifles, seized Dibra and even Ohrida, and forced Serbia to remobilise the Morava division and many of her reserves. In order to prevent fresh raids, the Serbs occupied certain strategic points in Albania, and this gave Austria-Hungary excuse for a sharp warning. Thus for the first fortnight of Oct. there was once more acute friction between Vienna and Belgrade. At last Serbia accepted the inevitable and withdrew her troops, but covered her retreat by a Note to the Great Powers, begging them to enjoin upon their Albanian protégés a respect for the frontiers created for their benefit. Even after this crisis was over, Count Berchtold made further trouble for Serbia by steadily opposing her Government's very natural desire to take over, so far as Serbian territory was concerned, the shares of the Orient Railway hitherto owned by Austrian subjects. Vienna's permanent ill-will was further revealed by attempts to block the conclusion of a concordat between Serbia and the Vatican.

By Christmas 1913 the situation in Old Serbia<sup>3</sup> was rapidly becoming normal, but the administration in the new territory left much to be desired, and the closing of Bulgarian schools, the expulsion of Exarchist clergy and occasional excesses against the Moslem population caused serious unrest and discontent. The Pašić administration became absorbed in defending itself against the increasingly violent onslaughts of the Opposition.

<sup>3</sup> Since 1912 this name was transferred to the original kingdom and the "Old Serbia" of Turkish times came to be called "New Serbia."

<sup>1</sup> Gueschoff, *The Balkan League*, p. 92.

<sup>2</sup> The essential facts were first revealed by Signor Giolitti in the Italian Parliament in Dec. 1914.

In Dec. 1913, and again on June 2 1914, it resigned, but eventually remained in office. On March 4 the Opposition had withdrawn from the Chamber as a protest against alleged unconstitutional action of the Government in budget matters. But though the tension was increased by the activities of a powerful military clique known as "The Black Hand," and by the sudden and arbitrary seizure of its Club premises by the masterful Minister of the Interior, Protić, the Government was still in office in the summer. The visit of Crown Prince Alexander and Pašić to St. Petersburg early in Feb. had given rise to rumours of a new Balkan League under Russian auspices; but the return of Radoslavov to power in Sofia had really made any such plan impracticable, and King Charles of Rumania, though bent upon co-operation with Serbia and receiving the Tsar with special honours at Constanta, had no idea of breaking his connection with the Triple Alliance.

*Murder of the Archduke.*—On June 24 King Peter, incapacitated by ill-health, appointed Prince Alexander as Regent, and simultaneously dissolved Parliament, Pašić having in April pledged himself to the elections for a "Great Skupština" for constitutional changes. Only four days later the assassination of the Archduke Francis Ferdinand and his wife at Sarajevo revived the latent Austro-Serbian conflict in an acuter form than ever. The authors of the crime, Princip and Čabrinović, belonged to a group of Bosnian Serb students, mostly under the age of 20, who gave terrorist expression to the universal discontent aroused by Austro-Hungarian repression throughout her Yugoslav provinces. The victories of Serbia during the Balkan Wars and the openly hostile policy pursued towards her by Vienna and Budapest had assured to her in the eyes of public opinion the position of a Yugoslav Piedmont. Though the initiative unquestionably rested with the Bosnians themselves, it was proved that the assassins had been in Belgrade and had been secretly smuggled across the Drina into Bosnia, after receiving hand grenades and revolvers from the Serbian Komitadjis Major Tankosić and Ciganović. On these facts the Ballplatz sought to establish the complicity, or at least the foreknowledge, of the Serbian Govt.; yet despite the compromising admissions of Mr. Ljuba Jovanović<sup>1</sup> the theory is improbable. The country was exhausted by two wars; the Albanian campaign in the previous autumn had shown the reluctance of the peasant soldiers to return to the colours, and it was now the eve of harvest. Military stocks were alarmingly low, as the next winter was to show. The young Prince had only just assumed the reins of government: the position of the Cabinet was shaky, and a fierce electoral campaign was opening. Delicate negotiations with Montenegro for a customs and military union, and perhaps even a dynastic arrangement, were still pending. Serbia had every conceivable motive for avoiding aggressive action. After the tragedy, it is difficult to see what other course her Government could have pursued; its one grave omission was to offer a thorough inquiry, without waiting for any suggestion from Vienna.<sup>2</sup>

*Ultimatum to Serbia.*—The secret of the ultimatum was jealously guarded, and the long delay created, as was intended, a false sense of security in some quarters. Its delivery at Belgrade, which took place at 6 P.M. on July 23, was carefully timed for the moment after President Poincaré's departure from St. Petersburg after his state visit, the object being to disorganise the diplomacy of the allies. The ultimatum, after reminding the Serbian Govt. of its formal undertakings of March 31 1909, charged it with "culpable tolerance" of terrorist propaganda directed against Austria-Hungary, and accused Serbian officers and functionaries of planning the Sarajevo murders. It therefore demanded that the Narodna Odbrana and any similar society guilty of anti-Austrian propaganda should be dissolved, that objectionable passages should be expunged from Serbian educational works, that all officers or officials whom Austria-Hungary might

name as guilty of propaganda should be dismissed, and that the Belgrade Govt. should not merely arrest certain specified persons charged with complicity, but should order the trial of others, allow Austro-Hungarian delegates to take part in the inquiry and accept the collaboration of Austro-Hungarian officials "in the suppression of the subversive movement."

The general impression produced by this document upon European opinion is best summarised in the words of Sir E. Grey, who telegraphed the next day to Sir M. de Bunsen that he "had never before seen one State address to another independent State a document of so formidable a character." The fifth demand in particular, that of collaboration, he pointed out "would be hardly consistent with the maintenance of Serbia's independent sovereignty."<sup>3</sup> None the less, Serbia in her reply actually consented to "such collaboration as agrees with the principle of international law, with criminal procedure and with good neighbourly relations." Only on one point did she reply definitely in the negative—the share of Austro-Hungarian officials in the actual inquiry would, it was argued, be a violation of the Constitution and the criminal code; but even this could be met by "communications in concrete cases."

On all other points there was unqualified submission, or only such reservations as were capable of easy adjustment: as a final proof of sincerity, Serbia offered to submit any outstanding points to the decision of The Hague Tribunal or even to the Great Powers which had imposed upon her the declaration of March 31 1909.<sup>4</sup> Thus Serbia is found for the third time in six years offering to submit herself to the verdict of The Hague (the two previous occasions being the Bosnian crisis and the Friedjung trial), and each time it is Austria-Hungary who rejects the proposal. Three days later, as a last resort, the Serbian Govt. informed the Italian Foreign Minister that it was even prepared to swallow the whole note, "if only some explanation were given regarding the mode in which Austrian agents would require to intervene," and went so far as to offer to accept these explanations from a third party, if Austria-Hungary were not disposed to give them to Serbia direct.<sup>5</sup>

Austria-Hungary had demanded an answer to her note by 6 P.M. on July 25, thus leaving a period of 48 hours for either reply or mediation. The official documents published in Berlin and Vienna since the War make it abundantly clear that the Ballplatz deliberately couched the note in such terms as to be unacceptable: but even in 1914 this was obvious from its tenor, and from the significant fact that Baron Giesl, who received the Serbian answer from Pašić a quarter of an hour before the expiry of the time limit, did not even open it, but handed him a fresh note announcing the rupture of diplomatic relations and the immediate departure of himself and his staff. Moreover, the text of the answer was kept secret in Vienna for several days, until a sarcastic commentary could be added; and Belgrade, presumably owing to the confusion which prevailed there, appears to have taken no steps to bring it promptly to the notice of the other Powers.<sup>6</sup> This is the more regrettable, since even William II. (to judge from his marginal notes on diplomatic documents, as published since the revolution) was impressed by the moderation of the Serbs, regarded Vienna's essential wishes as fulfilled and expressed the view that Giesl ought to have remained in Belgrade! His ministers, however, had failed to support Sir E. Grey's proposal for a prolongation of the time limit, and were thus responsible for bringing Russia into action. On July 27 the Tsar replied to a despairing appeal of the prince regent for assistance to Serbia by a telegram strongly urging him to "neglect no step which might lead to a settlement," but conveying the assurance that "Russia will in no case disinterest herself in the fate of Serbia."<sup>7</sup> On July 28 Austria-Hungary formally declared war upon Serbia. Henceforward the Austro-Serbian

quarrel is merged in the larger diplomatic conflict between Alliance and Entente; and the reader may be referred to the special articles dealing with that subject.

#### IV. THE WAR PERIOD

When Baron Giesl presented the ultimatum, Pašić had been absent electioneering in the provinces; but he at once returned to Belgrade, and on July 25 mobilisation was ordered, and the seat of government and the archives were hastily transferred to Nish. In view of so grave a crisis elections became impossible, and as parliamentary sanction was more than ever necessary, the Government had no other course than to ignore the fact of dissolution and to call the previous Skupština once more into existence. At its first meeting in Nish on Aug. 1, the entire Opposition endorsed the Government's action, and for the moment party life was in abeyance. Parliament also ratified the concordat with the Vatican and a law ensuring to Catholicism full freedom of worship in Serbia. There was an unexpected delay in the invasion of Serbia, and it was not till Aug. 12 that the first Austro-Hungarian troops crossed the Drina and the Save. After 12 days of desperate fighting (known as the battle of the Jader) the invaders were thrown back across the frontier, this being the first definite allied victory in the World War. Unduly elated by this success and by the news of Russia's rapid advance in Galicia, the Serbs were now led to underestimate Austria-Hungary's resources, and, encouraged by the Allies, passed to the offensive early in September. Their rash invasion of Syrmia—a necessary preliminary to any successful penetration of Bosnia from the east—soon proved beyond their strength and had to be abandoned by Sept. 13; and the joyous welcome everywhere accorded to them by the population merely brought down a cruel vengeance on its head when the Austro-Hungarian army returned.

A further mistake was made in attempting to hold the rich but strategically indefensible Mačva district, doubtless owing to the severe excesses committed there by the enemy during its first inroad. None the less the Serbs were able to check a second Austrian advance across the Drina in mid-September. But on Nov. 6 General Potiorek began a third invasion in great force, and during the next month steadily forced back the Serbian forces into the heart of their country. The danger was aggravated by shortage of ammunition, and when at last the necessary supplies began to arrive, a large force of Bulgarians raided the Vardar railway from the Strumnica salient and destroyed an important bridge on the only line by which the new guns could be moved up to the front. The enforced evacuation of Belgrade on Nov. 29 revealed the extremity of the danger, and brought the latent political crisis to a head. On Dec. 13 the purely Radical Cabinet was succeeded by a Coalition Govt., in which Pašić remained Premier, but the leaders of all parties save the Liberals received portfolios. It was, however, in this blackest week that the Skupština unanimously endorsed the Government's declaration that its foremost war aim was "the liberation and union of all our Serb, Croat and Slovene brethren not yet set free." This was the first public step of Serbia in favour of Yugoslav unity.

*Serbia after the Austrian Rout.*—With the arrival of munitions from the west the army's flagging spirits revived, and the brilliant offensive initiated on Dec. 2 by General Mišić and the I. Army resulted in the complete rout of Potiorek. By Dec. 14 Serbian soil was for the third time entirely free from invaders, and an enormous booty was captured. But the enemy left deadly infection behind him, and by the early spring of 1915 exhausted Serbia was immobilised by a typhus epidemic which is estimated to have caused about 300,000 deaths among the civil population. A notable part in checking its ravages was played by Lady Paget as head of the Serbian Relief Fund units in Skopje, and by Colonel Hunter and a R.A.M.C. detachment, who organised a scheme of disinfection on the whole Serbian railway system. The latter step appears to have been taken in view of the possibility of Allied troops being employed upon the Danube, an idea which receded from the general design in proportion as the Austro-German recovery in Galicia became more marked. Serbia's negative rôle during 1915 was due not only to exhaustion

but to considerations of high policy. The attitude of Bulgaria was from the first extremely equivocal, and Serbia, had she listened to certain ill-considered pleas for a fresh offensive into Hungary, would have been at any moment liable to an attack from the rear, unless she could rely upon Greece or the Allies to hold Bulgaria in check.

Meanwhile the Entente was eagerly working for the intervention of Italy and of Bulgaria, neither of whom could receive adequate satisfaction save at the expense of Serbian aspirations. During the winter pressure was repeatedly brought to bear upon Nish to make territorial concessions to Bulgaria in Macedonia; but the one and only condition upon which Serbia could safely have considered this—namely, that the Allies should guarantee Yugoslav unity in the event of victory—was precluded by their parallel negotiations with Italy, whose official policy it was to prevent, not to further Yugoslav unity, and to whom by the Treaty of London, concluded on April 26 1915, no less than 700,000 Yugoslavs were assigned. The fact that the concealment of this treaty from Serbia was made an absolute condition by Rome did not tend to diminish the reserve of Belgrade which almost immediately learned the essential facts through Supilo's discoveries in official circles at St. Petersburg. The Serbs, who were not formally recognised as Allies by the Western Powers, were more conscious than ever of the value to them of the Vardar valley, which would form part of any serious concessions to Bulgaria; and they were from the first sceptical as to the possibility of winning over Bulgaria, whom they believed to be tied to Vienna and Berlin by a secret compact. They were further handicapped by the attitude of Greece, who in the autumn of 1914 exercised her right of veto, under the Serbo-Greek Treaty, upon any cession of territory to Bulgaria and was prepared to demand Monastir as compensation. This attitude could not be ignored at a period when Greece was still ready to intervene on the side of the Allies, and when even King Constantine had firmly rejected William II.'s suggestion that he should fall upon Serbia and tear up the Treaty of Bucharest.

What changed the views of both Athens and Sofia was simply the unfavourable turn in the military fortunes of the Allies. As long as the Bulgarians thought that the Dardanelles would be forced, they could probably have been secured in return for the promise of Macedonia and the guarantee of an allied occupation; what was lacking was the corresponding pledge to Serbia. The conclusion of a Bulgarian loan in Berlin in Feb. was the first sign of a change, and after March neutrality was the best that the Allies could hope for from Bulgaria, though she showed great skill in furthering Bulgarophil illusions in the West. Thus the concrete proposals addressed to Sofia by the Entente on May 28, over Serbia's head, came two months too late.

*The Conquest of Serbia.*—During the summer the Radoslavov Cabinet continued to negotiate with the Entente, but it was merely playing for time, and on Sept. 6 concluded a secret alliance with the Central Powers. Meanwhile the Serbian Govt. was unduly optimistic as to Greek and Rumanian intervention, and its disbelief in a German invasion was encouraged by Allied military opinion. Only three weeks before Mackensen crossed the Danube, Lord Kitchener, in conversation with a Serbian representative, gave his opinion that any action from the North was mere bluff. Even after the opening of the Austro-German bombardment along the river front, and the mobilisation of Bulgaria, Allied opinion clung to the illusion that Bulgaria might enter on the Entente side, and therefore a veto was imposed upon the Serbian general staff's plan for an immediate attack upon Sofia before the Bulgarian army was ready (Sept. 27). Next day Sir Edward Grey in the House of Commons announced that in the event of Bulgaria's aggression "we are prepared to give to our friends in the Balkans all the support in our power, in the manner that would be most welcome to them, in concert with our Allies, without reserve and without qualification." Relying on the fulfilment of this pledge, the Serbs devoted their main effort to checking the Austro-German advance and remained on the defensive towards Bulgaria. The danger was increased by King Constantine's repudiation of Greece's treaty obligations

towards Serbia and the overthrow of Veniselos. That statesman, however, had inquired of the Allies as early as Sept. 23 whether, if Bulgaria declared war on Serbia, and if Greece asked Serbia to supply the 150,000 men stipulated by the Serbo-Greek Treaty for such a contingency, France and Britain would assume Serbia's obligation for her; and an affirmative answer was received within 48 hours.

On Oct. 6 the rupture with Bulgaria was complete. The fatal delays in sending the promised troops, coupled with Allied insistence that the Serbs should hold back Mackensen to the last moment, belong to military history; but their results were eminently political. At the critical moment of the Bulgarian menace to the Nish-Salonika railway there were at Salonika not 150,000 Allied troops ready for action, but 35,000 French and 13,000 British, the latter under strict injunctions from London not to cross the frontier into Serbia.<sup>1</sup> Nish was decorated to welcome Allies who never came. The whole Serbian plan of campaign collapsed, and the armies, losing control of the railway southwards, retired precipitately through the passes leading to the plain of Kosovo. General Sarraill, informed that he must not expect reinforcements, was forced to arrest his belated offensive northwards (Nov. 12) and soon to withdraw to the west of the Vardar. The Serbs were thus cut off from Allied help, lost Skoplje and only just escaped being cut off between the converging Austro-German and Bulgarian armies.

The final retreat of the Serbian Army and Govt. took place in the dead of winter across the inhospitable snow mountains of Albania and Montenegro to Scutari, Medua and Durazzo, a smaller section escaping southwards from Prizren and augmenting the Serbian forces south of Monastir. Fortunately the general exodus of the civilian population was checked before it had gone too far; but the retreat stands out as one of the great tragedies of the War. After dreadful sufferings the fugitives were conveyed by Allied transports to Corfu, which for the remainder of the War became the seat of the Serbian Govt. and a base for the convalescence and reorganisation of the army. Notable assistance was rendered by British voluntary units, and some idea of the generous response of the British public to Serbia's need may be gathered from the fact that the Serbian Relief Fund from first to last collected over £1,000,000, in money and material, and employed over 700 workers in Serbia, Albania, Corfu, Salonika, Corsica, Biserta and France; while the Scottish Women's Hospitals, under Dr. Elsie Inglis, performed notable services for the Serbs both on the Balkan and the Russian fronts. The deaths of Mrs. Deamer, Mrs. Harley (Lord French's sister), Mrs. Haverfield, Dr. Inglis herself and many others set a seal on the new-found friendship of the two nations.

Conquered Serbia was divided for administrative purposes between Austria-Hungary and Bulgaria, the latter holding the Timok, Nish, Skoplje and Macedonia; all that remained to the Serbs was a fragment of territory south of Monastir. Bulgaria now threw off the mask and officially declared the Serbian State to have ceased to exist. It therefore enrolled all men of military age throughout the occupied territory, and in Feb. 1917 extended this to include the whole male population. It refused to recognise the Serbian Red Cross and took possession of the Serbian Legation in Sofia. All ownerless land was confiscated, all Serbian schools, law courts and inscriptions were Bulgarianised, libraries and collections were either destroyed or removed to Bulgaria, the Serbian clergy were evicted and there were wholesale deportations. A formidable rising in the mountains behind Kursumlje was brutally repressed, with over 2,000 executions (March 1917). The war aims now repeatedly avowed by Sofia were the annexation not only of Macedonia, but of Kosovo and Prizren, and the whole upper Morava and Timok valleys; a common frontier with Hungary; the prevention of Yugoslav unity and of Russia's acquisition of Constantinople; and (after Rumania's entry) the retention of the whole Dobruja. Radoslavov more than once proclaimed Bulgaria's resolve to keep all her conquests,<sup>2</sup> and his official organs declared that Serbia's constitu-

tion, "no matter under what form, would be a perpetual menace to Balkan peace" and would never be permitted.<sup>3</sup> Austria-Hungary showed much greater reserve, airing from time to time various alternative schemes for a vassal Southern Slav State under the Habsburgs; keeping Prince Mirko of Montenegro as a possible candidate for its throne and employing agents in Switzerland to sow dissension among the exiles.

*The Serbs in Exile.*—Soon after the establishment of the Serbian Govt. at Corfu party rivalries began to revive. The deputies were scattered, living mostly on the Riviera, an independent press was impossible, and regular Allied subsidies made the Government virtually immune from serious democratic control. The supersession of the Voivode Putnik and almost all his staff caused great indignation; and though the whole Serbian Coalition must bear the responsibility, it was known to be the work of Pašić and his masterful colleague in the Radical party, Protić, then still out of office. In Aug. 1916 an attempt is alleged to have been made upon the life of the Prince Regent at the front, and the Government, after vainly urging the Skupština to institute a new form of courts-martial, proceeded in the winter—while the joint advance under Sarraill was crowned by the capture of Monastir from the Bulgarians—to order numerous arrests on a charge of conspiracy and murder. Among those implicated were the late Governor of Macedonia, General Popović, the ex-War Minister General Bojanović and several distinguished staff officers; and many line officers known for their gallantry were placed on the retired list or confined to the island of Corfu.

The conspiracy trial which opened in Salonika in Jan. 1917, and was conducted behind the shelter of a strict military censorship, resulted in a death sentence upon nine Serbian officers, and notably of Colonel Dimitrijević, head of the secret society known as "Union or Death," or more colloquially as "The Black Hand," whose chief aim had been to fan nationalist sentiments in the army. There is no doubt that "Apis," as Dimitrijević was called throughout the Slavonic South, interfered unwarrantably in politics, and that he had his hand in the Sarajevo murder; but the evidence for a plot against Prince Alexander was clearly inadequate, and he was the victim of rival military and political cliques. This trial revived all the old party dissensions: the reactionaries had triumphed on the very eve of the collapse of their chief support, the Tsarist Government. Pašić found himself between two fires—the need for a more democratic restatement of foreign policy, and the demand of the Young Radical and Progressive parties for a revision of the Salonika trial. Refusal led to their withdrawal from the Cabinet, and its reconstruction on a purely Old Radical basis under Pašić and Protić.

The last occasion when all parties co-operated was on July 20 1917, when the Declaration of Corfu, drawn up between Trumbić for the Yugoslav Committee and Pašić for the Serbian Govt., met with unanimous approval. It affirms that the Serbs, Croats and Slovenes constitute a single nation, and demands complete national unity under the Karagjorgjević dynasty, a constitutional democratic and parliamentary monarchy and the reference of all details to a Constituent Assembly after the War. Pašić, having strengthened his position abroad by a visit to Paris and London, declined to convoke Parliament for four months after the legal period had expired. At last, as the result of a direct appeal of its President to the Crown, it met in Corfu on Feb. 12 1918 and the Government resigned, but after weeks of fruitless negotiation for a Coalition Ministry was allowed to resume office. The Opposition, which numbered 60 as against 64 Old Radicals, still insisted on the revision of the trial and the transference of Foreign Affairs from Pašić to their own candidate Drašković; and in April, when the budget was introduced, they withdrew in a body from the Chamber, thus leaving the Government without the quorum of 84 required by the Serbian Constitution.

Serbian public opinion was too scattered and disorganised to be effective, and the Corfu Govt. tried to discredit its opponents' action before the uninformed West as defeatist or even Austrophil. Thus throughout the spring and summer of 1918 there was

<sup>2</sup> e.g. *Narodni Prava*, May 19; *Kambana*, Oct. 9 1916.

<sup>2</sup> e.g., in *Vossische Zeitung*, Oct. 10 1916.

acute and growing tension among the rival Serbian groups, and the real initiative in the Yugoslav question and in the political campaign against Austria-Hungary had passed to Trumbić, Beneš, Lansing and the Allies and to the leaders of the movement inside the Dual Monarchy. On April 8 1918 a "Congress of the Oppressed Nationalities of Austria-Hungary" was opened on the Roman Capitol, at which the agreement reached a month earlier in London between Trumbić, on behalf of the Yugoslav Committee, and Andrea Torre, as representing an influential committee of Italian deputies and senators, was publicly proclaimed as the basis of common action. The result was immediate in two directions. The propaganda organised on the Italian front by delegates of all the national committees (Yugoslav, Czech, Polish, Rumanian) led to wholesale defections from the Austro-Hungarian army, and contributed materially, according to the high command's own admission, to the failure of the last Piave offensive in June. Meanwhile the Roman Congress was deliberately imitated inside the Dual Monarchy by an imposing Congress at Prague, attended by Czech, Polish, Rumanian, Slovak and Yugoslav delegates—among the latter Radić and Pribičević. Their resolutions, though necessarily vague, amounted to a pledge of mutual support in the cause of unity and independence.

During 1918 the initiative among the Yugoslavs of the Monarchy fell more and more into the hands of the Slovenes, led by Father Korošec since the premature death of Monsignor Krek. The official recognition accorded to the Pact of Rome by Lansing in the name of America (May 31) was a fresh encouragement; and Korošec, after constituting a Yugoslav National Council for the furtherance of unity, convoked a new Slav Congress at Ljubljana on Aug. 18. One of its most significant features was the demonstrative share taken by the Catholic hierarchy and leading clergy. In the early autumn, at the Emperor Charles's instance, Count Tisza visited Zagreb, Sarajevo and Dalmatia with the object of promoting a Hungarian solution of the Southern Slav question, but met everywhere with a blank refusal. The surrender of Bulgaria (Sept. 30) naturally rendered the nationalities indisposed to concession, and the Austrian Premier's admission that national autonomy was now inevitable was icily received. The Czech and Yugoslav spokesmen in the Reichsrat now insisted on separate representation at the peace negotiations and the absolute right to decide their own future state allegiance.

*The Collapse of Austria-Hungary.*—Events now followed each other with lightning speed. On Oct. 4 Austria-Hungary in a note to America accepted President Wilson's speeches as a basis of discussion, and on the 8th Baron Hussarek admitted that the Monarchy's internal structure must be modified and "full-grown nations" determine their own future. This only precipitated the collapse, and while Count Tisza voiced Hungarian public opinion in declaring the basis of the Dual system to be shattered, the Yugoslav National Council was transplanted from Ljubljana to Zagreb, and strengthened by the inclusion of representatives of all parties (Oct. 10). On the 16th the Hungarian Govt. declared in favour of Personal Union, and next day Hussarek published an Imperial Proclamation, dated Oct. 16, dividing *Austria* (not Austria-Hungary) into four federal units (German, Czech, Yugoslav and Ukrainian), and leaving the Poles to make their own decision. This project was stillborn and pleased no one. Korošec in the name of the Czech and Yugoslav Clubs unreservedly rejected it, and claimed that the future of both nations was an international problem which only the future Peace Conference could solve.

Henceforth the Yugoslavs acted independently of both Vienna and Budapest; and when on Oct. 21 the news of President Wilson's answer to Count Burian's final Peace Note (refusing to negotiate save on the basis of a recognition of Czechoslovak and Yugoslav national claims) became generally known, the old régime vanished almost as if by magic. Extraordinary scenes took place in many towns, the troops tearing off their military badges with the Habsburg Arms and trampling them underfoot. National councils were speedily formed in Dalmatia and Bosnia,

which arranged for the disarmament of the troops pouring northwards from the broken Albanian and Macedonian fronts. As early as the 23rd a Croat regiment stationed in Fiume disarmed the Magyar militia and took possession of the town. On the 24th Count Andrássy was appointed Joint Foreign Minister, but the machinery of State had ceased to work, and both the Austrian and Hungarian Cabinets were in *statu demissionis*.

On the 28th (the same day on which the Czechoslovak Republic was born in Prague) the military command in Zagreb handed over its authority to the National Council, and next day the Diet proclaimed the independence of Croatia from Hungary and assumed control of Fiume. The arsenals of Pola and Cattaro were already in the hands of the insurgents; and the Emperor Charles, in the hope either of winning the favour of the new régime in Zagreb or throwing an apple of discord between it and the Entente, signed a decree on Oct. 31 making over the whole Austro-Hungarian fleet to the Yugoslav State. This was not unnaturally interpreted by the Italian Nationalists as a proof of collusion between Zagreb and Vienna; nor was it generally known that as early as Oct. 4 M. M. Stěpánek and Giunio, as delegates of the Czech and Yugoslav revolutionary committee, reached Italy in a fishing boat, to concert with the Allies a general rising along the coast, but were closely imprisoned in Rome and not allowed to communicate with Beneš and Trumbić till nearly three weeks had been lost. But for this delay the fleet might have been in the Entente's hands a fortnight before the final Italian offensive opened on the Piave. Unhappily, every step led to a fresh misunderstanding. The action of the Supreme Council in Paris in prescribing the frontier line of the Secret Treaty of London as the line of occupation under the Austro-Hungarian Armistice was keenly resented by the Yugoslavs as a breach with Wilsonian principles. The Allies very properly insisted that the fleet must be surrendered into their hands, but before this could take place a deplorable incident occurred in Pola harbour, the "Viribus Unitis" being blown up by an Italian mine, with a Yugoslav admiral and crew on board. In Italy Baron Sonnino's frankly anti-Slav attitude threw Signor Orlando and the Pact of Rome into the shade; and the Consulta worked hard to prevent Yugoslavia's recognition by the Allies.

## V. THE UNION

*Rival Programmes.*—That this recognition had not already been accorded before the collapse of the Central Powers began was due to disunion among the Yugoslavs themselves. During the summer America gave a lead to the Allies by accepting the Yugoslav programme, and after Austria's failure on the Piave there was a growing disposition on the part of the Western Powers to fall into line with Lansing's very clear pronouncements. But Pašić, free from the restraints of a coalition and from all parliamentary control, had reverted to his original Pan-Serb standpoint, and steadily declined to reconstruct his Cabinet on a wider Yugoslav basis. Trumbić on his part could not enter a purely Serbian Cabinet without prejudicing that freedom of choice of his compatriots in the Dual Monarchy upon which the moral case of the Yugoslavs depended. A series of incidents proved the difference of outlook to be not merely personal but fundamental. In July Mihajlović, the Serbian Minister at Washington, was summarily dismissed by Pašić, the reason being his refusal as a good Yugoslav to transmit to the American Govt. a project assigning Bosnia to Serbia as "compensation" in the event of a patched-up peace.

On July 25 at the Mansion House, London, Balfour publicly endorsed the full Yugoslav programme, as formulated by the Serbian Minister, J. M. Jovanović; but the latter's full report to his home Government was answered by a severe snub, and during the winter he too was dismissed for his Yugoslav sentiments. When on Aug. 9 Balfour officially recognised the Czechoslovak National Council as "trustees of the future Czechoslovak Govt." he was ready to extend a similar recognition to the Yugoslav cause, but as a preliminary condition he very reasonably insisted upon unanimity between those who claimed to represent the groups of Yugoslavs. Pašić adhered to his standpoint, and even

the efforts of Veniselos and Take Jonescu to bring him and Trumbić together were unavailing. When in the last week of Oct. the rival statesmen moved from London to Paris, all hope of Yugoslav recognition before the Peace Conference had vanished, owing to the stiffening in the attitude of Italy.

One of the first steps of the new Zagreb Govt. was to recognise Trumbić and his committee as its representatives abroad, and to send delegates to Switzerland to discuss the measures for consummating national unity. On Nov. 9 the Declaration of Geneva was signed by Pašić as Serbian Premier, Korošec, Čingrija (mayor and deputy of Ragusa) and Žerjav (a Slovene Progressive) for the Zagreb Council, Trumbić and four others for the Yugoslav Committee, and Trifković, Drašković and Marin-ković as chiefs of the Serbian opposition parties. "By this act," it was laid down, "the new State appears and stands from to-day as an indivisible state-unit and as a member of the Society of Free Nations. The former frontiers no longer exist." The Governments of Belgrade and Zagreb were to retain their former spheres until a Constituent Assembly, elected by universal suffrage, could draw up a new Constitution.

Yielding to the unanimous desire of the other delegates, Pašić officially requested the Entente to recognise the Zagreb Council as the supreme authority in the ex-Austro-Hungarian Provinces, and Trumbić as its accredited representative in the West, until unification could be completed. The repeated efforts made by Pašić to avert so distasteful a decision were held to disqualify him from the leadership of the new united Cabinet, but in order to secure his renunciation it was found necessary to exclude the other party chiefs. This arrangement, however, never really came into force, for the simple reason that telegraphic communications between the West and Serbia were hopelessly irregular, and that events continued to move, with the advance of the Serbian Army and civil authorities from the south, and of the Italian Army beyond the armistice line, in the direction of Ljubljana.

To meet the impending danger, the Zagreb Govt. urgently invited the assistance of the Serbian Army, which during the final advance contained a large proportion of Yugoslav volunteers. The first Serbian troops entered Fiume on Nov. 18, and a most dangerous situation arose between them and the Italians in Istria and Dalmatia, which was only very partially mitigated by the dispatch of American military and naval forces to Trieste and Fiume. Much of the blame falls upon the Supreme Council, which shrank from the only effective means of allaying friction—immediate Allied occupation of the disputed zone, pending the decision of the Peace Conference. The Council's occasional outbursts against Italy only rendered Baron Sonnino still more intractable, and irritated Italian public opinion. No satisfactory solution was possible unless the Treaty of London was abrogated, and this involved the abandonment of other secret treaties to which Paris and London clung. America pointedly defined the Adriatic problem as a test case, but amid the pressure of other affairs it was allowed to drift.

*The Union.*—The equivocal attitude of the Entente towards the new State naturally hastened the process of union. On Nov. 23 the Zagreb National Council proclaimed the union of the territories under its control with the kingdoms of Serbia and Montenegro, and invited the Prince Regent of Serbia to assume the Regency of the new State. This decision (passed with only one dissentient voice, but that unhappily Stephen Radić, the peasant leader) took formal effect on Dec. 1, when Prince Alexander, at the formal request of 24 delegates from Zagreb, proclaimed the union and repeated their cry, "Long live free and united Yugoslavia." Meanwhile on Nov. 26 a hurriedly convoked National Assembly at Podgorica had proclaimed the deposition of King Nicholas and his dynasty and the union of Montenegro with Serbia in the new united State. The first Yugoslav Cabinet was constituted under Protić as Premier and Korošec as Vice-Premier; Trumbić became Foreign Minister; other portfolios were divided more or less equally between Serbia and the new territories.

**SERBIAN CAMPAIGNS.**—Overshadowed by the scale of operations on the Western and Eastern Fronts, the importance of events which took place on the Southern Front is not always realised. In the Balkans, where the World War started, there were never less than 1,000,000 men of varied nationalities fighting each other in this theatre, and here the crushing defeat of the Bulgarian Army in Sept. 1918 first knocked one of the Central Powers out of the War. The 1914 operations and the conquest of Serbia in 1915 are described in separate sections below, while an account is given of the Allied operations in Macedonia, 1915-8, and of the reconquest of Serbia, under the heading **SALONIKA CAMPAIGNS.**

#### I. OPERATIONS IN 1914

The Austro-Hungarian problem in starting a campaign against Serbia was complicated by the prospect of Russian intervention in Galicia; the Austrian staff had, accordingly, drawn up two plans of concentration.

*Alternative Austro-Hungarian Plans.*—The first plan, in case of war against Serbia and Montenegro, called Concentration B (Balkan), involved the employment of seven corps and two cavalry divisions. The second plan, in case of war with Russia and Serbia, called Concentration R (Russia), involved the employment against Russia of nine corps and five cavalry divisions; against Serbia and Montenegro of a minimum group of three corps and some independent divisions and brigades and the formation of a reserve (four corps, two cav. divs.) which could be directed as required towards the Russian frontier or those of Serbia and Montenegro.

Convinced at first that they would have to deal only with the southern Slavs, Austria-Hungary ordered, on July 26, the partial mobilisation required for Concentration B; but, owing to complications with Russia, general mobilisation was proclaimed on July 31. To avoid confusion, the Austro-Hungarian staff decided to allow Concentration B to be completed before withdrawing the reserve provided for in plan R. The concentration of the Austro-Hungarian armies, therefore, took place in three phases.

#### TABLE I.

1. July 27—Aug. 16. Balkan Front (Potiorek), II. Army (Boehm-Ermoli); IV., VII., IX. Corps (131 Bns.); Danube-Sava front. V. Army (Frank); VIII., XIII. Corps (79 Bns.); Lower Drina up to Ljubovija.
- VI. Army (Potiorek); XV. XVI. Corps (74 Mountain Bns.). Višegrad—Foča area.
2. Aug. 4-24. Russian front. Remainder of the Austro-Hungarian forces.
3. Aug. 14-Sept. 8. II. Army transferred to Galicia.

*Serbian Mobilisation.*—The Serbian general mobilisation, ordered on July 25, yielded 490,000 men at the outset, and some 43,000 more between Aug. and September. Montenegro declared war on Austria-Hungary on Aug. 5 1914. Her forces amounted to about 50,000 militia with very little artillery, and were of no direct assistance to Serbia, though they occupied the attention of three Austrian mountain brigades. Circumstances compelled Serbia to adopt a purely defensive strategy. Her army, com-

manded by the Crown Prince Alexander, with Voivode Putnik as chief of staff, was therefore concentrated in a central position enabling it to operate either towards the Sava and Danube or towards the Drina:

After the withdrawal of the Austrian II. Army, the Serbs had a superiority not only in numbers but also in quality, 90% of them having fought in the 1912-3 wars, and three-quarters of their guns being better than the Austrians'. On the other hand, Austria's equipment and resources in ammunition were far superior.

*Jadar Operations, and Cer Battle: Aug. 16-24.*—North Serbia is a mountainous country, devoid of good communications, particularly in the northwest, whilst the actual frontier was formed on the north by the formidable obstacle of the Danube and Sava, on the west by the Drina, a river not very broad but swift and difficult to bridge. The plan for the invasion of Serbia, drawn up by Conrad von Hotzendorff and Moltke in consultation, involved a concentric advance from all fronts, but was vitiated by the withdrawal of the II. Army. Potiorek, however, who feared an advance of the Serbs over the Drina to excite insurrection among their kinsmen in Bosnia, launched, on his own responsibility, a preventive offensive.

On the night of Aug. 11-12, the Austrians (VIII., XIII. and elements of IV. and IX. Corps) began to cross on a wide front from Drenovac on the Sava to Ljubovija on the Middle Drina, successfully driving back the Serbian frontier detachments. The Serbian Army moved to oppose the enemy, and by the evening of the 15th the II. Army occupied positions on a line south of Šabac, across the Cer and Iverak ridges and the Jadar valley, connecting with the III. Army who had moved forward from Valjevo to Zavlaka and Krupanj. The I. Army had taken over the whole northern front as far as Obrenovac.

On the 16th, after severe fighting, the Austrian XIII. Corps drove back the left and centre of the Serbian III. Army, capturing Krupanj and threatening the Valjevo-Osečina road behind the Serbian positions. On the right of the II. Army the Serbs were also forced to give way, but in the centre a local counter-attack secured for the Serbs the important position of Kosačegrad (Aug. 18). This enabled General Stepanović to launch on the 19th a counter-stroke along the Cer and Iverak ridges, which swept the Austrian VIII. Corps down in the utmost confusion into the Lješaica and Jadar valleys and over the Drina. The Austrian right wing, less hard pressed, and better organised for mountain warfare, retired in good order, but by the 22nd the whole river front was again occupied by the Serbs. The Austrian II. Army fared no better, losing prisoners and guns in their retreat over the Sava.

By the 24th the first invasion of Serbia was ended, with a loss of about 50,000 men to the Austrians. The Austrian commander-in-chief had greatly underestimated the military value of the forces opposed to him, while, on the Serbian side, Putnik's management of his forces and his choice of the moment and place of counter-attack were masterly.

*Syrmian Operation, and Drina Battle.*—Meanwhile, no events had taken place on the northern front east of Obrenovac other than the evident withdrawal of the Austrian II. Army. Putnik decided to throw his I. Army across the Sava into Syrmia in order to secure the line Mitrovica-Fruška range—Danube to Semlin and Belgrade. This would thrust back the line of deployment of any future attack from the north and enable the Serbs to invade Bosnia without fear of a sudden attack in the flank and rear.

After making good crossings on the night of Sept. 5-6, the I. Army occupied Semlin and was progressing towards its objective when the situation on the Drina front caused its recall. It was safely withdrawn across the Sava by the 14th and hurried off to the new battle of the Drina. On the Austrian side Potiorek was reorganising his forces for a new thrust across the Drina. His VIII., XIII., XV. and the major part of his XVI. Corps bordered the Drina from the Sava to Ljubovija, where the Serbian II. and III. Armies were also deployed in strength.

Potiorek's second offensive opened on the night of Sept. 7-8. In the north the VIII. Corps only succeeded in securing a bridgehead at Parašnica, but in the south the XV. and the right of the XIII. Corps crossed in force between Zvornik and Ljubovija, driving back the Serbian left to the Gučevo-Boranja-Jagodnja ridge. By the 11th, the situation was serious enough to compel Serbian G.H.Q. to order the transfer of the I. Army from Syrmia to Valjevo-Pecka. On the 13th, the XIII. Corps, having successfully crossed the Drina at Kurtovića, threatened not only to cut the Serbian line in two but to roll up the whole Gučevo-Jagodnja position. After severe fighting, on Sept. 16, a strong counter-attack was launched by the I. Army against the Austrian right. By the 18th the XV. Corps had been driven off the Jagodnja ridge to the line Karačica-Ljubovija, where trench warfare set in.

On the Mačva front the advance of the VIII. Corps from Parašnica was resumed in combination with a crossing at Jarak by Krauss's Corps. Here also trench warfare set in on the line of the two bridgeheads; north of Šabac-Glušci and Ravnje-Serbian Rača. The Serbs barely succeeded in holding up the invaders, whom they failed to drive back over the rivers. Meanwhile the Užice Army and the Montenegrins had successfully undertaken a series of operations designed to prepare the way for the offensive over the Drina, but, being forestalled by the Austrian attack, they had no practical results.

*Kolubara and Rudnik Operations.*—The Serbs suffered severely from the unfamiliar conditions of trench warfare and a shortage of ammunition, and Potiorek decided to make a third attack, although winter was near at hand. The new offensive opened with an attack in the Mačva by Krauss's and the VIII. Corps, which drove back the Serbs to the line Dobrava-Cer ridge. The main Austrian attack, however, again took place on the right, where the XIII. Corps on Nov. 6 and the XV. and XVI. Corps on the 7th drove the Serbs off the entire Gučevo-Jagodnja ridge. On the 8th the Serbian centre had to be withdrawn. Putnik, after attempting to cover Valjevo, decided to try and hold up the Austrian advance on the so-called "Kolubara line." This line, which ran from Obrenovac in the north along the rivers Kolubara and Ljig to the Maljen ridge, was occupied by the 16th by the Obrenovac Group, II., III. and I. Armies, whilst the Užice Army still covered Užice. The weather was terrible, but the Austrian XVI. Corps, pushing along the Maljen ridge, attacked on the 17th, and drove the Serbs off that ridge. On the Austrian left the advance of the V. Army to the Kolubara made good the passage of the Lower Kolubara by the 25th.

Putnik now resolved to give up Belgrade and to fight for time so as to last out until the arrival of ammunition enabled him to launch a counter-offensive. He therefore withdrew his forces during the night of Nov. 29-30 to a line with its flanks resting on the Danube at Obrenovac and on the Lower Morava, its centre on the heights at Kosmaj and Bukulja and the Rudnik Massif. The Austrians entered Belgrade on Dec. 1.

On the arrival of munitions Putnik undertook a counter-offensive; it opened on Dec. 3 with an attack of the I. Army

under Mišić, which drove a deep wedge in the enemy lines. Further north the II. and III. Armies made little progress at first, the Serbian right being seriously threatened by a counter-attack (Dec. 6-9) effected by Krauss's and VIII. Corps. In the south, however, Mišić's Army swept the Austrians back towards Valjevo and Užice with such success that, on the 6th, Potiorek ordered a general retreat on Belgrade, Šabac and Loznica. All the Serbian armies then took up the pursuit, but mud and exhaustion prevented them from turning the Austrian retreat into a rout. There was, however, heavy local fighting, many prisoners and much booty being taken. By Dec. 16, Belgrade had been re-occupied, while Šabac, Loznica and Bajina Bašta had been retaken by the pursuing I. and Užice Armies. Putnik's decisive victory gave Serbia peace for a few months, but her losses had been very heavy—60,000 killed or died of sickness, 18,000 wounded and some 15,000 prisoners.

## II. THE CONQUEST OF SERBIA

The third expedition having ended in failure, Potiorek was relieved of his command; a portion of his troops transferred to other fronts, and General Tersztianski left with a much-weakened force. The latter, however, was incapable of taking the offensive, their sorely depleted ranks being further devastated by an epidemic of typhus.

*Mackensen Takes Command.*—Meanwhile Falkenhayn had become convinced of the necessity of opening up direct railway communications with Turkey, and, the active support of Bulgaria having been secured, a new combined offensive was prepared for the autumn under a German commander, Marshal Mackensen.

His forces consisted of:—

TABLE III.

| Unit                                            | Commander | Area                             |
|-------------------------------------------------|-----------|----------------------------------|
| Austrian III. Army (2 Austrian, 1 German Corps) | Kövess    | Syrmia                           |
| German XI. Army (3 Corps)                       | Gallwitz  | Banat                            |
| Bulgarian I. Army (4 Divs.)                     | Bojadiev  | Vidin-Kula-Belogradchik-Tsariboa |
| Bulgarian II. Army                              | Tokorov   | Kyustendil-Strumitza             |

1 1 Bulgarian Div. equals 2 normal divs.

The Serbian dispositions were influenced by the threat from the east which the Western Powers had forbidden Serbia to meet by a preventive offensive, and by the hope of assistance from Salonika. Serbian fighting strength was not more than 200,000; but the help of Greece was invoked under the 1913 treaty, and that of the Western Powers promised. Putnik deployed three-fifths of his forces facing north and guarded the route to Salonika with the rest.

TABLE IV.

| Unit           | Area                                                      |

| Bojović Group  | East of Skoplje (Üsküb), on southern routes from Bulgaria |

*Mackensen's Attack.*—Mackensen assembled a mass of heavy artillery and modern appliances, and a heavy preliminary bombardment opened on Oct. 5, the 6th being fixed as the day of attack for Kövess and Gallwitz and the 11th for the Bulgars. Kövess's main crossing, undertaken by two corps with the support of an intense bombardment, took place at Belgrade. After three days' fierce fighting, bridgeheads were secured and the Serbs forced to evacuate their capital (Oct. 9-10). His third corps, who crossed the Lower Drina and Sava, were held up in the Mačva. Simultaneously after a demonstration at Orsova

and a Bulgarian threat towards Negotin, two of Gallwitz's corps secured crossings at Ram, and over Temessziget (Ostrov) Island, but his third corps was held up between Semendria and Grocka.

On the 11th Putnik began a steady policy of fighting successive delaying actions on the northern front, keeping back the Bulgars on the right and rear in order to gain time for the arrival of French and British aid, the first elements of which (British 10th, French 156th Div.) had started to land at Salonika on Oct. 3. Whilst heavy fighting was going on in the Morava valley and the mountains to the west, the Bulgarian advance began to threaten Piroć and the Salonika railway. Vranje was occupied on Oct. 16, whilst further south Todorov occupied Skoplje (Üsküb) on Oct. 21, thus cutting the Salonika line, and driving a deep wedge between the Serbs and the advancing Anglo-French force under Gen. Sarraill.

*Austro-German Successes.*—Until then the Austro-German Armies from the north had made but slow progress, but the Bulgarian successes on his right forced Putnik to withdraw his left and centre concentrically towards Kraljevo-Kruševaci. Zaječar was evacuated on the 25th, Knjaževac on the 27th, and after repeated counter-attacks from Piroć, Stepanović retired on Bela Palanka on the 29th. From Nov. 1 onwards a desperate effort was made by the Serbs to hold the arc Cačak-Kragujevac-Jagodnja-Nish-Leskovac. The Bulgars were held back at Bela Palanka, but the Germans and Austrians advanced steadily. Kragujevac fell with its arsenal on Nov. 11, Jagodnja and Kraljevo on the 3rd, Paraćin on the 5th. By the 9th Nish fell, and the defence of this line was at an end. The Orient railway, Falkenhayn's objective, was now clear from Germany to Constantinople.

*Final Serbian Effort.*—Making a further effort to envelop the Serbian right, the Bulgar II. Army moved out fanwise from Vranje on Priština and from Skoplje (Üsküb) on Kačanić, Qalqandelen (Tetovo) and the Babuna pass, whilst its left was heavily engaged with considerable Anglo-French forces from Lake Doiran to Krivolak and Kavadar. In a last attempt to break through to the south Putnik assembled the remnants of five divisions round Priština and struck at the Bulgar II. Army on the 9th, driving back its right to Vranje and towards Kumanovo. But the arrival of part of the Bulgar I. Army from Leskovac on his left rear and the pressure of the Germans and Austrians from the north made it impossible for Putnik to persist; he then decided to escape through Albania with what could be saved of his army.

Between Nov. 20 and 25, the historic plain of Kosovo Polje witnessed another last effort of the Serbian people, then everything flowed away towards Peć, Đakovica and Prizren. The pursuit ceased in the first week of December. The Bulgar II. Army then turned south and drove the Anglo-French force over the Serbian border. By Dec. 16 this force had withdrawn to Salonika (see SALONIKA CAMPAIGNS). Montenegro was completely occupied by the third week in Jan. 1916.

The end of the pursuit did not mean rest and reorganisation for the remnant of the Serbian Army. A midwinter march through the Albanian mountains brought those whom its rigour left alive to the coast of the Adriatic. Thence they were transferred to Corfu, and later to Salonika, where the Western Powers provided food, clothing, equipment and stores, mitigating to that extent a disaster which might have been prevented by a more vigorous policy towards Bulgaria and Greece, and the earlier dispatch of the reinforcements which were ultimately sent.

**SERBO-CROAT LITERATURE** (see 7.476).—Perhaps the most noticeable and important characteristic of the modern literatures of the Serbs and the Croats is to be observed in their marked

1 These were followed by the French 57th and 122nd Divs. (Oct. 15-31) and British 22nd, 26th, 27th and 28th Divs. (Nov. 10-28).

*rapprochement*. The tendency to merge or coalesce has grown steadily stronger since the first decade of the present century, when the change in political relations, resulting in the Serbo-Croat coalition of 1906, brought with it the beginnings of a closer relationship between the literary men of both peoples. The blending of thoughts and ideas has been even more pronounced since the union of the two nations in 1918, though it is, perhaps, too soon to speak of one and the same "Serbo-Croat" literature. The two literatures have grown and developed fundamentally under different conditions; consequently, each has retained certain individual traits. Croatian literature until 1918 naturally reflected the political and racial aspirations of the Croats under Austro-Hungarian rule, whereas in Serbia there was no corresponding problem to colour the literature of the time, although it, too, was in some measure concerned with questions of political and social organisation.

The turn of the century marks, nevertheless, in both countries, a change in the attitude of literary men towards their subjects. The attempts of writers during the 'nineties to revive the Romanticism of the middle of the 19th century were superseded by a realism which differed from that of the 'seventies and 'eighties in that it was more consciously opposed to Romanticism both in subject and form. Practically all the modern literary movements of Europe have been reflected in the literatures of the Yugoslavs, and in the 20th century French literature came to exercise a predominant influence, in succession to German, Hungarian and Russian influences, although the last continued until the outbreak of the World War and contributed to the triumph of realism. In Serbia, literature became more individualistic, at first melancholy and pessimistic in tone, but gradually growing happier as the political outlook improved. In Croatia, too, writers were concerned with individuals, but the setting was less local in character, and hence literary works as a whole were less coloured by local atmosphere. Dalmatia, from a literary point of view, remained somewhat apart from these tendencies; it had long felt the influence of Italian literature and has continued to look to Italian sources.

*Poetry*.—The growth of realism in Serbia and Croatia found expression in the forms taken by literature as well as in subject and spirit. Epic poetry has been neglected and practically abandoned in both countries. Lyric poetry, on the contrary, has made considerable progress, and there are a number of lyric poets of a really high order. But the new lyric poetry is unlike the older lyrics, which, in Croatia especially, are pathetic, declamatory and patriotic; it is "objective" and finished in its style. Its models have been the French "Parnassiens" (Baudelaire, Leconte de Lisle, Hérédia) and the "Symbolists" (Verlaine). From the point of view of language, and of the art of verse especially, it shows a remarkable advance. The foremost representatives of this school are Jovan Dučić (b. 1874), Yugoslav diplomatic agent at Cairo, and M. Rakić (b. 1876), Yugoslav minister at Sofia. Of modern Croatian lyric poets, D. Domjanović (b. 1875), M. Begović (b. 1876) and V. Nazor (b. 1876) are the most prominent.

*Fiction*.—In prose, the short story has developed further than the novel. It is well represented in both literatures by a number of gifted writers; in Serbian by B. Stanković (b. 1876), I. Čipiko (b. 1860), and P. Kočić (1877–1916); in Croat by D. Šimunović (b. 1873), I. Kozarac (1885–1910), J. Kosor (b. 1879) and A. G. Matoš (1873–1914). It is modelled in general upon the Russian short story, but German and Italian (especially D'Annunzio) models are used among the Croats and in Dalmatia. The long novel as a realistic study is still in its infancy; it fails to reach the standard of the romance of the 19th century, but material is gradually being accumulated which may in the near future provide a basis for realistic novels.

*Drama*.—Modern Serbian drama, like the novel, has shown decidedly less progress than its Croat fellow, and in spite of frequent prize competitions and a closer co-operation with Croat writers of plays still remains undeveloped. Ivo Vojnović (b. 1851), a Dalmatian novelist and playwright, who is one of a small number of authors midway between the Serb and Croat

literatures, has composed plays of distinct merit. Specially noteworthy are his *Ragusan Trilogy* (2nd ed. 1909), part of which has been published in the *Slavonic Review* (No. 1), and *The Mother of the Jugović*. In Croatia proper, drama may be said to have become the most prominent form of contemporary literature. Under the influence of Ibsen and Hauptmann on the one hand, and of Rostand and Maeterlinck on the other, two main currents are to be remarked—the one naturalistic, social, analytic; the other symbolic and lyrical. The former is represented by S. Tucić (b. 1873) and the latter by M. Ogrizović (b. 1871). One of Tucić's plays, *The Liberators*, was published in English in 1918. J. Kosor also has written a number of plays, four of which were published in English in 1917 under the title *People of the Universe*.

*Criticism*.—Meanwhile in Serbia literary criticism tends to take the foremost place. In this form of literature the Serbs seem always to have been stronger than the Croats. Under the influence of the modern French school, Serbian literary criticism has advanced in judgment and subtlety, although it tends, possibly, to be over-critical and is quicker to blame than to praise. Among the Serbs social as well as literary criticism was represented by Professor J. Škerlić (1877–1914), who, though removed at the early age of 37, had already exercised a profound influence upon the movement for Yugoslav unity. Aesthetics are represented by Professor Bogdan Popović (b. 1863), who belongs to the school of Sainte Beuve and Faguet. Among the Croats, the former is represented by Milan Marjanović (b. 1879) and the latter by B. Livadić (b. 1871). Prominent places must also be given to the following Serbian critics: Prof. Pavle Popović (b. 1868) and B. Lazarević (1883), Yugoslav Minister in Albania.

*History*.—Serious historical studies are of comparatively recent date. Rački was the founder of a historical school in Zagreb, whose chief living representatives are Klaić and Šišić. Since the death of Novaković the leading Serbian historian is Slobodan Jovanović, author of three brilliant studies on the history of Serbia from 1842 to 1878; and mention should also be made of T. Gjorgjević (social conditions, ethnography and folklore), G. Jakišić, Stanojević and Čorović. The death of M. Gavrilović, Yugoslav Minister in London, before he had completed the fourth volume of his classical biography of Miloš Obrenović, was a severe loss to historical criticism.

*Journalism*.—Foremost among literary and political journals are *Srpski Književni Glasnik*, fortnightly (Belgrade); *Nova Europa* (tri-monthly, Zagreb); *Leopis* (published by Matica Srpska in Novi Sad); *Savremenik*, *Novi Život* and *Misao* (Belgrade, 1921), organ of the younger and more advanced literary school. The Serbian academy in Belgrade, the Yugoslav academy in Zagreb and the Srpska Matica in Novi Sad, and the museums of Sarajevo and Spalato (Spljet) are the main centres of learned and scientific publication.

*Literary Women*.—A development which is of fairly recent date in Serbo-Croat literature should perhaps be noticed here, namely the increasing number of women poets, story writers, essayists and critics. Among these, Isidora Sekulić and M. Janović in Serbia and A. Milčinić and I. Brlić-Mazuranić in Croatia deserve special mention. Of writers who have only come to the front since the War the most prominent are I. Andrić (b. 1891) of Sarajevo, perhaps the most talented of the younger Yugoslav poets; and among story-writers Milan Krlaža, whose realistic studies of the War, made a profound sensation in Croatia, and D. Vasić, both the latter being very outspoken in their criticism of political and social conditions. (D. Su.)

**SERUM THERAPY**.—Serum therapy consists in the introduction into the patient of blood serum containing specific antibodies, performed in some other animal, which will (a) neutralise the toxins produced by the corresponding infecting bacteria or (b) destroy the corresponding bacteria themselves—thus establishing a condition of "passive" immunity (*q.v.*).

*Action of Microbes*.—Disease-producing microbes may be divided into two broad groups (1) those secreting poisonous substances or *toxins* into the surrounding tissues or (2) those multi-

plying and invading areas far distant from the point at which they gained entry to the body of their host.

**Anti-toxin and Immune Body.**—Again, speaking generally, natural recovery from a bacterial infection due to an organism of the first group coincides with the appearance in the blood serum of a neutralising agent known as *anti-toxin* in adequate amount; whilst when dealing with microbes of the second class, nature elaborates, also in the serum, a different anti-body—a bacteriolysin or immune body for the purpose of destroying the invading bacteria. In each instance the resulting anti-body is specific in character—that is to say, it will only act vis-à-vis with the particular toxin in the one case or in the other with the members of that particular species of microbe whose entry into the body provoked its formation—the serum which is the vehicle of the curative substance is termed in this first instance “anti-toxic” and in the second “anti-bacterial.” Thus the early and accurate <sup>test</sup> <sup>of the</sup> <sup>bacterium</sup> <sup>responsible for any infection</sup> it is <sup>first</sup> <sup>used</sup> to treat determines the selection of the appropriate anti-serum.

**Preparation of Anti-serum.**—As these sera are nowadays employed in considerable quantities it is customary to select a large mammal, such as the horse, for immunisation. After a period of observation during which the freedom of the animal from diseases transmissible to man is established, a series of subcutaneous injections is undertaken starting with an artificially attenuated virus or a mixture of toxin and previously obtained anti-toxin as the case may be and gradually increasing the size of the dose and the potency thereof until the animal is able to withstand enormous quantities of highly poisonous material without any ill effects while maintaining perfect physical condition. From time to time small quantities of blood are withdrawn from the animal and the serum tested to ascertain the amount of anti-body that is available, and when a suitable stage has been reached the animal is bled to the extent of several pints, the serum carefully separated from the blood corpuscles and passed through a sterile porcelain filter to ensure its freedom from bacteria. Occasionally the serum is concentrated, some of its unneeded proteins removed and purified.

**Standardisation.**—It is obvious that a correct appreciation of its valency is necessary for the scientific employment of any serum in the treatment of disease; but, unfortunately, bacterial poisons formed by various micro-organisms, and even by different strains of the same species, not only exhibit many variations in toxicity depending upon biological factors (not all of which are at present known) but they have, so far, proved incapable of isolation in a state of chemical purity. Consequently, it is only possible in the majority of instances to effect a comparison by observing the results of their introduction into suitable experimental animals.

**Biological Test.**—Indeed only in the case of diphtheria toxin is there any universally accepted standard, for here Ehrlich prepared, many years ago, a standard diphtheria anti-toxin of constant valency which is preserved hermetically sealed in vacuo, by means of which all diphtheria toxins can be graded and the potency of the sera prepared by their means expressed in anti-toxic units.

In the case of toxins produced by other bacteria, and in the preparation of anti-bacterial sera, the plan usually adopted is to inoculate gradually decreasing doses of the virus into susceptible animals until the smallest quantity that will cause death with certainty, and within a specified time, is determined. This is termed the minimal lethal dose (M.L.D.) and forms the basis for the standardisation of the corresponding anti-serum. Varying quantities of serum are in turn mixed with a constant dose of virus—usually 100 M.L.D.—and injected into animals until that amount of serum is determined which will effectively neutralise the test dose. This quantity of serum is then regarded as containing one unit of anti-body and the serum which is in process of standardisation is stated to contain so many units per cubic centimetre.

**Anti-toxin Sera.**—Of the anti-toxin sera, diphtheria anti-toxin is rightly regarded as the most efficient. Its use, now almost

universal, has been largely responsible for the reduction of the death-rate from diphtheria (*see* INFECTIOUS FEVERS) in a most striking manner from over 33% in pre-anti-toxin days to about 7 per cent. This latter figure includes all cases in all stages, but if treatment is instituted on the first day of disease the mortality falls to zero. Tetanus anti-toxin is also of great value, but owing chiefly to the fact that Tetanus (*q.v.*) is rarely diagnosed until the toxin has secured a firm hold upon nervous elements, it has not achieved a position as a therapeutic agent equal to that occupied by diphtheria anti-toxin. On the other hand the mass of evidence accumulated in the World War clearly demonstrates the necessity for its use in the prophylactic treatment of earth-soiled wounds. Gas gangrene, rife during the early days of the World War, led to the production of highly efficient anti-sera for the toxins of *B. welchii* and the vibrios septique, the necessity for which has largely passed. Another serum, for the neutralisation of the toxin of bacillus botulinus—a germ which gives rise to a particularly fatal type of food poisoning fortunately rare in the British Isles—is also prepared but there is little evidence available as to its efficiency (*see* FOOD POISONING).

Finally, Calmette has obtained an anti-toxic serum, “anti-venene,” from horses which he had immunised against both colubrine and viperine venoms.

**Anti-bacterial Sera.**—Many varieties of anti-bacterial sera have been prepared against many of the microbes of the second group, but few of them have stood the test of time; and at the present day only anti-streptococcic, anti-meningococcic, anti-pneumococcic, anti-anthrax and anti-dysentery sera remain. These have established their positions in the therapeutic armament largely as the result of recent acquisitions to our knowledge of the biology of certain microbes but in part also to improvements in the methods of preparing anti-sera.

The recognition that numberless strains of streptococci exist which though morphologically identical are biologically diverse has resulted in the preparation of polyvalent sera which sometimes produce dramatic recoveries in apparently hopeless cases of septicaemia, although in other instances serum is employed without avail. In the case of infections by the pneumococcus too, several different types may be encountered to some of which no curative serum could be prepared. Within recent years these organisms have been classed into four different groups of which the two first were alone amenable to serum treatment—that designated Type 1 being particularly so. Similarly, and largely as the result of researches necessitated by the prevalence of the so-called “spotted fever” (*see* SPINAL MENINGITIS) during the War the meningococci have been grouped under four types and whilst multivalent sera comprising anti-bodies for all types have been made, the use of appropriate univalent sera has afforded even more successful results. The two anti-sera prepared against pathogenic bacilli, anti-anthrax and anti-dysentery, are both of very considerable value. The first has long been employed either alone or in conjunction with operative measures in the treatment of “malignant pustule,” but the position of the latter depends almost entirely upon the ample demonstration of its value in the War provided it is used early in the disease.

**SERVICE, ROBERT WILLIAM** (1874– ), Canadian poet and novelist, was born at Preston, England, Jan 16 1874, and educated at Hillhead Public School, Glasgow. After serving an apprenticeship with the Commercial Bank of Scotland in Glasgow, he went in 1905 to Canada and settled for a short time in Vancouver island. Later, after pursuing a variety of occupations in different parts of the Pacific coast he entered the Canadian Bank of Commerce in Victoria, B.C. He was afterwards transferred first to White Horse in the Yukon and then to Dawson. In all he spent eight years in the Yukon and travelled widely. During his last years with the bank he wrote verse describing life in the North, notably *Songs of a Sourdough* (1907) and *Ballads of a Cheechako*. In 1910 appeared a novel *The Trail of '98* giving a vivid description

of men and conditions in the Klondike. During the Balkan War of 1912-3 Service was war correspondent to *The Toronto Star* and served this paper in the same capacity during the World War, in which he spent two years as an ambulance driver in the Canadian Army Medical Corps. He described his war experiences in *Rhymes of a Red Cross Man* (1916). After the War he devoted himself entirely to literary work and settled in Paris.

His other works include *Rhymes of a Rolling Stone* (1913); *Ballads of a Bohemian* (1920); *Poisoned Paradise*, a novel of Monte Carlo (1922); *The Roughneck* (1923).

**SEVERN**, England and Wales (see 24.723).—In 1920 a scheme was brought out for a barrage across the River Severn, carrying a road and railway, which should utilise the tides for the production of electrical power. The first part of the scheme provided for the construction of a locked basin, about 27 m. square, on the lower Severn, formed by a barrage close to the line of the Severn tunnel; much of it would accommodate the largest vessels at all states of the tide. High tides would be trapped by the barrage, and the water led out to turbines. Part of the power from this installation would be employed to pump water to a salt-water lake high up in the valley of the Wye, with turbines in the tidal area lower down the river. When the barrage scheme was not working owing to the state of the tide, or at times of heavy pressure, the water from this lake would be used to work the turbines on the Wye. It was estimated that over 500,000 H.P. would be generated for a 10-hour day, with a peak-load capacity of over 1,000,000 horse-power. The water power resources committee of the Board of Trade reported on the scheme as deserving of further investigation, but owing to the necessity of economy it was dropped at the time.

In 1924 the Great Western Railway sought parliamentary powers for the building of a bridge to relieve the congestion of traffic in the Severn tunnel, and this project was postponed whilst a further examination of the barrage scheme was made. Preliminary geological and hydrographical investigations have been undertaken by a committee appointed by the Government, and an engineers' report, to take two or three years to complete, was also being prepared in 1925. The main question to be settled, apart from the engineering problem, is whether the proposed interference with the tidal currents would cause siltage in the ports of Bristol, Cardiff and Newport. (See TIDAL POWER.)

**SÈVRES, TREATY OF**, the Treaty of Peace, concluded between the Allied and Associated Powers and Turkey on Aug. 10 1920. It was not ratified and was later superseded by the Treaty of Lausanne (q.v.), which was signed on July 24 1923. The principal arrangements of the Treaty of Sèvres were as follows:—

The King of Hejaz was recognised as independent and the Holy Places were placed under his care. The boundaries of Turkey were so drawn as to exclude her from control of any other Arabian States or of Syria, Palestine and Mesopotamia, and Turkey renounced in favour of the Principal Allied Powers rights over territory outside Europe that lay outside her new frontiers (Egypt, Sudan, Libya [Tripoli], Morocco and Tunis). Palestine was to be entrusted to a Mandatory Power, Syria and Mesopotamia "provisionally recognised as independent States to be advised by Mandatory Powers." Smyrna and the Ionian hinterland were placed under Greek administration for five years, when further arrangements would be made. The Dodecanese islands were ceded to Italy, Imbros and Tenedos to Greece, and Turkey recognised Greece's sovereignty in Lemnos, Samothrace, Mytilene, Chios, Samos and Nikaria. The zone of the Straits from Constantinople and Scutari to the Dardanelles, and a zone on the Asiatic mainland were handed over to an international commission to be internationalised and demilitarised. Western Thrace, which had already been ceded to the Allies as a whole, was ceded by them to Greece by separate treaty. Turkey ceded Greece Eastern Thrace, up to the Chatalja lines. Turkey agreed to recognise Armenia as "a free and independent State" while Kurdistan was to receive local autonomy. The Turkish Army was to be reduced to 50,000, all Turkish aircraft was to be surrendered and all the fleet except a few ships and torpedo boats.

The financial clauses charged Turkey with loss, with damage and with war guilt, but admitted that, as her resources were unequal to payment, such claims should be waived. But immense powers were conferred on a Financial Commission of British, French and Italian representatives with a Turkish representative in a consultative capacity, which was practically empowered to control the budget and the financial laws and regulations of Turkey. The Council

of the Ottoman Public Debt was to be similarly formed and to have complete powers over its administration. The Capitulations were to be re-established for the Allies but not for enemy Powers, and the separate postal system of the Allies was also re-erected. Various Turkish ports, Constantinople, Smyrna, Alexandretta, etc., and the River Maritsa, were to be placed under international control. See H. W. V. Temperley, ed. *Hist. of the Peace Conference at Paris*, vol. VI. (1924).

**SEWING MACHINE:** see HOUSEHOLD APPLIANCES.

**SEX** (see 24.745).—The problem of the determination of sex has in recent years been greatly elucidated. Knowledge has come from several sources. Both breeding experiments and cytological observation have severally led, as will be seen, to concordant conclusions, proving that the sex of the offspring is generally decided by one or other of the germ-cells which unite in fertilisation. But though in ordinary circumstances the mode of determination is now known, there are nevertheless indications that in special cases the normal course may be altered or at least disturbed by various influences, the operation of which is not understood. The reconciliation of this latter class of evidence with the former has not yet been satisfactorily effected.

*Sex Determined by Spermatozoa.*—Knowledge of sex-determination began with the observation of Henking (1891) that in certain insects the spermatozoa were of two kinds, (1) those which contained a supernumerary, unpaired or accessory chromosome (see CYTOLOGY), now generally called the X-chromosome, and (2) those without this body. McClung (1902) first suggested that this chromosome might be a determiner of sex, and took it to be the peculiarity of the male, but Miss Stevens (1905) and E. B. Wilson (1905), to whom the development of this part of the subject is chiefly due, proved that the spermatozoa bearing the X-chromosome are in these animals destined to form females. The eggs are alike in each possessing an X, and thus the somatic or diploid cells of the daughters come to have 2 X, one received from their mother and one from their father, whereas the diploid cells of the sons have one only, received from their mother. Since the gametes of the male are of two kinds, that sex is said to be *hetero-gametic*, the female being *homo-gametic*. Further observation, however, showed that the organisation of even nearly allied genera of insects is by no means uniform in respect of the sex-chromosomes. Though unpaired in the males of some genera, the X may in others have a pair or "mate" of smaller size, known as the Y-chromosome. Between these and other genera in which the male has a pair of sex-chromosomes not visibly different from each other there are several transitional conditions. In a considerable number of forms also, the X is represented by a group of separate chromosomes, regarded as collectively the mates of the Y.

The X-chromosome has been seen in several orders of insects, especially Hemiptera, Orthoptera and Coleoptera, in spiders, myriapods and some nematodes. It has also been found in various mammals and in several dioecious plants. In man cytological observation is difficult but the best determination (Painters) gives 48 as the diploid number, with an X and a small Y in the male.

*Sex Determined by Ova.*—Naturally this discovery that the male is hetero-gametic was at first supposed to be of universal application, but the next advance, which resulted from experimental breeding, showed that this simple view could not be entertained. The Currant Moth (*Abraxa grossulariata*) has a variety *lacticolour*, characterised by a deficiency of black pigment, previously known only in the female. Doncaster, instituting experiments with this variety, found that by breeding such females with normal males the F<sub>1</sub> family consisted of males and females all normal.<sup>1</sup> Interbred, these gave F<sub>2</sub> composed of two normal males: one normal female: one *lacticolour* female. But *lacticolour* ♀ × F<sub>1</sub>♂ produced families containing normal ♂, normal ♀, *lacticolour* ♂ and *lacticolour* ♀, all in equal numbers. On breeding any normal *grossulariata* ♀ with the *lacticolour* ♂ now produced, the sons were all *grossulariata* and the daughters all *lacticolour*.

<sup>1</sup>In genetics the following symbols are frequently used: ♀ = female; ♂ = male; × = mated with F<sub>1</sub>, F<sub>2</sub>, etc. = the first filial family, the second, etc.

Other interpretations have been proposed; but it is evident that the eggs of the *grossulariata* ♀ are of two kinds, (1) those which are destined to be females, and do not carry the *grossulariata* factor (2) those which do carry this factor, and are destined to be males (Bateson and Punnett). Taking the factors G, *grossulariata*; g, its absence; F, femaleness; f, its absence, the results may be represented symbolically thus:—

**Sex-limitation and Sex-linkage.**—Such a system of heredity is sometimes called "sex-limited," (though more usually "sex-linked" since the limitation is not absolute) and the descent of the character so limited serves as an indication of the mode by which the factor determining sex is transmitted from parent to offspring. The proof that in these moths sex is determined by the eggs, or in other words that the female is the hetero-gametic sex, is thus complete. The same has been shown to be true of birds. In fowls, several conditions have been shown to be sex-limited to females; e.g., black as against the *cuckoo-markings* of the Plymouth Rock; golden (as in Sebrights or Hamburgs) as against silver; the black pigment of Silky fowls is suppressed by a sex-limited factor which inhibits this development, etc. In canaries the peculiar form of albinism known as *Cinnamon*, and in doves the pale albinotic variety shows a similar behaviour. We have thus to recognise that, paradoxical as it may appear, sex is in some animals determined by the sperm, and in others by the eggs. Man belongs to the former class. The descent of sex-limited conditions, notably colour-blindness, demonstrates this. Substituting male for female, colour-blindness is transmitted in man exactly as the *lacticolour* character is in the moths. A colour-blind man mated with a normal woman has sons and daughters with normal colour-vision. The sons cannot transmit the colour-blindness, but the daughters transmit it to half their sons who are therefore colour-blind. Moreover, when the transmitting female is mated with the colour-blind man, the colour-blind female is produced, just as in the corresponding mating (3) in the *grossulariata* experiment, the *lacticolour* male was formed. Finally when the colour-blind woman mates with a normal man the sons are all colour-blind and the daughters are all transmitters.

**Cytological Interpretation.**—This attractive branch of Genetics has been actively developed by T. H. Morgan and his colleagues with remarkable success; and though serious difficulties remain, the incidence of the sex-limited characteristics can so readily be interpreted as depending on the distribution of sex-chromosomes, observed or hypothetical, that a causative influence has with great plausibility been attributed to them. Starting from the now familiar fact that in certain animals the XY male has visibly one X-chromosome and the XX female two, it is argued that the "double-dose" of X is the cause of the female characteristics and that one dose of the same element produces the male attributes. If, then, in such animals the dominant factors, which

show linkage, be supposed to be also carried in the X-chromosome, the sex-limited distribution of the negative characteristics to males will result. At first sight the fact that in other animals the female is hetero-gametic seems irreconcilable with this scheme, but, by making the assumption that in these females a similar cytological apparatus exists, the genetic observations may be represented on the same plan as that adopted for the hetero-gametic males. For the hetero-gametic female may be represented as XY and the male as XX, and here again if the X carries the positive element, say the G of *grossulariata*, then the gamete of the composition XG is always destined to the sons, and Yg to the daughters, as the facts require.

The "limitation" to sex is in all such examples regarded as a consequence of the attachment of the positive factor, or element concerned, to the X-chromosome. By observation we know that just as in *grossulariata* the normal female is always heterozygous for the recessive *lacticolour*, so in Man the normal male is always heterozygous for the recessive colour-blindness; and this is interpreted to mean that the unpaired or unequally paired sex-chromosome is in each case responsible for contributing the dominant. Nevertheless evidence from other sources, especially the experiments on the fish *Lebistes* (Winge) prevents us from asserting as a universal rule that the X-chromosome (or its analogue) is exclusively the positive contributor, since in that animal the paradox is well established that though females are all alike both in appearance and in genetical constitution, yet the sons always in certain respects resemble the fathers exclusively. The facts suggest that the Y-chromosome, which in species with hetero-gametic males must normally be passed along the male line alone, may contain definite Mendelian factors.

The strongest evidence in favour of the chromosome hypothesis has been found in the phenomenon of "non-disjunction" in *Drosophila*, the fruit-fly, whose genetical composition has been studied more fully than that of any other organism (see GENETICS). In this creature the male is hetero-gametic. Exceptionally, unexpected forms appear, as, for instance, red-eyed males in the mating where white-eyed alone should normally be produced. Bridges found that in such individuals and among the families containing these abnormal members, irregularities in the occurrence of the chromosomes could be demonstrated. Apparently in some maturation division two X-chromosomes had passed to the same egg, others receiving none. From this a series of exceptionally constituted gametes are derived which could have brought about the observed exceptions. Another line of argument pointing to the same conclusion has been derived by Morgan and his associates from a study of gynandromorphs—the curious individuals composed of irregular patchwork of male and female tissues, which are formed with some frequency especially among the various orders of insects. A number of these have occurred in the pedigree families of *Drosophila*, and on analysis it was found possible in almost every case to refer the characters shown in the several parts to their parental origin.

A primary objection to these modes of interpretation is that the cytological conclusions rest on a still slender basis of observation. As regards the forms with hetero-gametic females an unpaired chromosome has been reported to exist in the females of two moths (*Phragmatobia* and a *Psychid*), but in other forms it has been searched for in vain. The student should constantly bear in mind that statements to the effect that a certain character "is borne by the X-chromosome," etc., are often only founded on analogy, and are not rarely made even in regard to forms of life in which we are fairly sure that no demonstrable X-chromosome exists. Conversely in certain animals having an alternation of generations, especially some Nematoda (see Boveri, P. Hertwig), though an X-chromosome is easily demonstrated to be unpaired in males though paired in females, no attempt to bring the facts of the life-history into one consistent scheme of sex-determination has been successful.

The presence of two X-chromosomes is thus regarded as the determining cause of sex, constituting the female in the one group of animals and the male in the other. Nevertheless the evidence derived from the many curious forms resulting from

non-disjunction in *Drosophila* has led to a modification of this very simple conception. By the errors of cell-division 3 X-chromosomes for example may be together associated in one body and accompanying these may be various numbers of the other chromosomes (autosomes). Such abnormalities may be arranged in a series ranging from infra-males to supra-females and study of their cytological content shows that the several chromosomes must exert an antagonistic action, in which the X especially, but to some extent also the two larger autosomes, must influence the organism towards femaleness, whereas minute 4th chromosome acts in the contrary sense in the direction of maleness. This idea of "balance," as it is called, has been introduced with great plausibility by Bridges.

Cytology has been of great assistance in codifying the apparently contradictory records as to the intricate series of parthenogenetic or agamic and sexual forms of the Hymenoptera and Hemiptera. We have learnt for example that in Hemiptera (Morgan; Von Baehr) when fertilisation produces females only, the fact is due to the death of all the sperms, which do not bear the X-chromosome. In a white fly (*Aleyrodes*) also Schrader has demonstrated a very simple system, eggs which are not fertilised remain haploid and produce males only. In the hive-bee a similar system obtains though beset by complications still not fully cleared up. Also in these groups it not rarely happens (*Neuroterus*, Doncaster) that the fertilised females give rise parthenogenetically to other females of which, without fertilisation, some produce females only and others males only, but no cytological distinction between these two types of females has been seen. Whatever be the true cytological account of sex-determination, we have nevertheless to recognise that femaleness and maleness respectively, though similar throughout the Metazoa both in outward manifestations and in deeper physiological features, are constructed upon at least two distinct genetic plans. To reconcile the infrequency of visible cytological distinctions between the sexes with the chromosome hypothesis it has been suggested that the critical bodies are in such cases attached to other chromosomes, but this, though undeniable as a possibility, is as an argument dangerously tinged with obscurantism, a comment which applies to many of the subordinate hypotheses supporting the chromosome theory of genetic causation.

The situation is one through which many scientific problems have passed before final solution has been obtained. By independent lines of evidence conclusions largely identical have been reached. The facts are not in dispute, but a consistent interpretation of the whole series has not been obtained up to the present time.

*Disturbance of Normal Sex-Ratios: the Production of Inter-Sexes.*—Hybridisation is not rarely followed by a disturbance of the normal sex-ratio. For example, from domestic hens crossed with cock pheasants, male mules (sterile) are easily bred but female mules seldom if ever. Among Bovidae some crosses give fertile females but sterile males (S. v. Nathusius) and the same occurs in a cross between species of cavies (Detlefsen). Among Lepidoptera a series of such examples are known, the first having been observed by Standfuss, who called attention to the absence or scarcity of females in many species-crosses. Recently Goldschmidt, working with races or species of *Lymantria dispar* brought together from many countries, carried out a remarkable series of experiments. He found that a Japanese race used as ♀ × European ♂ gave normal males and females, but that in the reciprocal cross though the males came normal, the females were intersexes, exhibiting many transitional stages, approaching males in various degrees both in form, colour and instincts. When Japanese males of certain races were used, the whole of the female offspring are said to have been thus transformed into males. Goldschmidt states that the various races can be arranged in an ascending scale according to the completeness with which these effects are produced, but the phenomena showed many complications not as yet adequately represented, notably the appearance of partially transformed male intersexes in the F<sub>2</sub> generation raised by inter-breeding the normal offspring raised in the first experiment. It has been pointed out by J. B. S.

Haldane (1922) that, apart from certain exceptions, a general principle can be perceived in this group of phenomena. If in hybrid offspring either sex is consistently missing or defective, this will be the hetero-gametic sex, e.g., in birds and Lepidoptera, the female, in mammals, the male.

*Sex of Twins.*—The facts hitherto dealt with all go to prove that sex is determined by the gametic contribution made by one or other of the parents and that this is the normal course is not open to question. In harmony with that conception of sex-determination, it is found that when, as in twinning of embryos and generally when the fertilized egg multiplies by division, the products are commonly all of the same sex. In the armadillo (*Tatusia novem-cincta*), studied in detail by Newman, four embryos, demonstrably arising by division of one blastodermic vesicle (developing ovum), are usually produced at a birth and are always of the same sex, the four being all males or all females. Patterson found an exception in the case of the parasitic Hymenopteron *Paracopidosomopsis*, which by polyembryonic division sometimes produces both males, females and intermediates. That something analogous to non-disjunction here occurs is an acceptable interpretation of this anomalous instance. But there is a remarkable group of incontrovertible facts which show that sometimes the normal course of sex-development may be disturbed. F. Lillie discovered a remarkable example. When in horned cattle twins of opposite sexes occur, the female is sometimes sterile, being called a free-martin. It might be thought that these twins arose by division of one fertilised ovum, but Lillie by study of material from the Chicago stock-yards proved that an ovum had dehiscid from each ovary and that therefore the twins were originally distinct. He further showed that sometimes the twins had an actual anastomosis between their foetal circulations. The presence of a male embryo must therefore be regarded as having the power of inhibiting the development of the female embryo, poisoning it in so far as the formation of at least the external organs is concerned.

*Effects of External Conditions.*—Disturbance of the normal sex-ratios as a consequence of various interferences, such as starvation, high or low temperature, etc., has several times been alleged to occur, especially in Amphibia, and the evidence of R. Hertwig that delay in fertilising the eggs of the frogs causes the production of a preponderance of males has been fully confirmed. Circumstantial details preclude the obvious suggestion that this is a result of differential mortality. Hertwig thought that inasmuch as the polar bodies are excluded very late after the eggs are laid, his result might perhaps be reconciled with the conception of cytological pre-determination if the conditions of the experiment could in some way have decided which elements should be retained in the egg and which ejected in the polar body. Recently Seiler has made an observation of this kind in regard to a Psychid moth, *Talaeoporia*. He states that if the females are kept in a high temperature while the eggs are undergoing maturation, it can be seen on cytological examination that the accessory chromosome more frequently remains in the egg, and that as a matter of observation more males are produced, the converse occurring under cold conditions. As to the genetical composition of the Amphibian intersexes, an important observation has lately been made by Crew. From the eggs of a female frog, fertilised by a male showing intersexual characters, 774 tadpoles were reared, all females.

Hence the important inference may be drawn that though by some unknown cause the sex of a frog, cytologically female XX., may be completely altered to the extent that it grows up in all respects a male, producing sperms which fertilise eggs, yet in the determination of the sex of its own offspring the effect of the original cytological constitution appears, for the sperms all carry the X-chromosome and daughters only result. From other signs, however, we know that sex-determination in Amphibia, and perhaps some fishes also, is beset with complications. In many fishes hermaphrodites are common and the frog is peculiar in the fact that ova are commonly found in very young males, the final determination of sex being postponed, sometimes indefinitely.

According to Baltzer, sex in *Bonellia* is directly determined by the conditions of larval life. The female is of course an animal of considerable size, whereas the male is a minute creature parasitic on her. Larvae which find the proboscis of the female and attach themselves to it are said to develop into males, those which remain free-swimming becoming females. Larvae artificially detached from the proboscis become intersexes. Adequate controls, by which the hypothesis of predisposition may be excluded, would in such an instance be most difficult to institute.

*Effects of Castration.*—Collateral evidence bearing on the nature of the distinction between the sexes has been drawn from many sources, especially from the results of castration, but though the facts thus empirically observed are of much physiological interest, they have no very direct bearing on the primary problem. The reproductive glands, acting, presumably, by virtue of the secretions (hormones) of their interstitial components, have often a great influence on the development and maintenance of secondary sexual characters, but the part played by the hormones must obviously be of a secondary nature. Removal of the genital glands has divers effects in various animals. In good agreement with the discovery that in the bird the female is the hetero-gametic sex, it is found that both in the fowl and the duck (Goodale) the removal of the ovary induces the plumage and some other characteristics of the male. The female is thus an organism in which the male attributes are concealed or recessive, whereas a capon does not develop hen-feathering. Moreover, Morgan found that in the Sebright bantam, the males of which are "hen" in plumage (not in combs or wattles), after castration the cocks acquire ordinary male plumage, which may naturally be interpreted to mean that the hen-feathering of these cocks is due to their possession of part of the female complex which has been transferred to them. Morgan and Punnett also have shown that the hen" character behaves as dominant in breeding, a fact which proves that the dominance proper to the whole female complex of the bird pertains also to that part of the complex which controls the plumage.

Castration performed on moths during the larval stage has not produced modification of secondary sexual characters (Oudemans). In crabs, however, the destruction of the testes by certain parasites produces very striking "feminisation" of the abdomen and appendages (Geoffrey Smith), but we do not know which sex in Crustacea is hetero-gametic, though work on *gammarus* points to this being the male. We are without a satisfactory interpretation of this group of observations, some of which superficially considered seem to run counter to the facts of gametic determination already established, but the disturbances of the normal course may commonly, though perhaps not always, be conceived of as due to interruption of the chain of events by which the full effects of gametic predetermination are developed.

*Hermaphrodites.*—Attention should be called to a remarkable lacuna in our knowledge of sex-determination. Up to the present nothing has been yet discovered either by cytological or analytical methods as to the genetical relation of the hermaphrodite types among animals to those in which the sexes are distinct. In plants a little progress has, as will appear, been made, pointing to the conclusion that the hermaphrodite is dominant, containing something which the females at least do not, but as to hermaphrodite animals nothing can be said with confidence. This is much to be regretted, as the whole subject might be greatly advanced by such knowledge.

*General Considerations.*—The primary sexual distinctions evidently depend on factorial elements which follow more or less closely the familiar principles of Mendelian segregation. The determining factor for sex should probably be regarded as a complex, usually transmitted in its entirety, but capable by accidental errors of cell-division of being disintegrated, so that the elements responsible for special characteristics may become detached from the rest and may even be passed over to the sex which normally does not receive them. For example, the races of fowls which do not incubate have presumably thus lost a portion of the dominant sex-complex; the hen-like cocks of the Sebright bantam may be represented as having acquired that

ingredient of the female sex-factor which in the normal female inhibits the formation of the sickle-feathers and hackles of the cock, and so on. A similar representation may be applied to those cases (e.g., Phalaropes) in which the cocks are hen-like and normally incubate the eggs. It is not unreasonable to suppose that the transference of an actual fragment of critical material, presumably a portion of a chromosome, is responsible for the physiological abnormality. The literature of obstetrics and of stock-breeding abounds with nostrums for the arbitrary regulation of sex in man and the domestic animals, but from what is accurately known of the mechanism of sex-determination, nothing favourable to these claims can yet be adduced. Nor can any explanation be offered of the fairly constant departures from equality which normally occur in man and various domesticated animals. In the pig, ox and rabbit the male births are said sensibly to exceed the female, but in the horse and sheep there is a small excess of female births. The races of man show definite differences in the proportions of the sexes at birth. Of living births, taking females at 1,000, the males for England and Wales were for some time slightly below 1,040, which, though about the same as the proportion in Japan, is somewhat low in comparison with Germany, several European countries and the white population of the United States, in which the males are about 1,060. On the other hand for the coloured population of the United States the male births are still less in proportion (in the year 1890, 1,024) and occasionally fall actually below the female number (998 in 1900). In all countries for which data can be obtained the proportion of males among *still-births* is very largely in excess of the females. Such divergences usually point to differential mortality or to the action of lethal factors, but in view of the large excess of males among still-births this account is not readily applicable here. The excess of males (surviving infancy) is exceptionally large in certain, though not all, of the families affected with the tendency to bleed profusely from trifling injuries, known as haemophilia. This is one of the sex-linked abnormalities appearing in males which follow much the same system of descent as colour-blindness. Illegitimate births in most countries show a distinct diminution in the excess of males.

Since the publication of Düsing, the proposition which he (following earlier writers) developed, that war produces an increase in the proportion of male births, has been widely disseminated. S. Newcomb investigated data as to births in the United States during the Civil War but found no positive result, and other parts of the evidence have been declared to be fallacious. Nevertheless, statistics for Great Britain and also those for Germany during the World War show a progressive rise which, though amounting to only one or two per cent, can scarcely be deemed insignificant. It should be remarked, however, that this rise had begun in Prussia some years before the War. On the other hand, no similar change has taken place in the neutral countries. For an adequate consideration of the facts many concomitant phenomena must be taken into account; for example, the fact that the total birth-rate of Prussia fell in the war period to less than half. Whatever be the immediate cause of the rise in male births, it is likely that it should be referred to the incidence of a differential pre-natal mortality rather than to any more fundamental genetic process.

*Sex in Plants.*—The attempt to make a factorial analysis of sex in the higher plants has not led to clear conclusions. Dioecious plants suitable for experiment are few. Correns, from results obtained in reciprocal crosses made between *Bryonia dioica* and the monoecious *B. alba*, inferred that the male of *dioica* was hetero-gametic, but the argument did not amount to proof. Shull's experiments with *Lychnis dioica* and a variation having the elements of both sexes present together were also beset with many complications and obscurities. In dioecious mosses the Marchals proved that segregation, in respect of sex, normally occurs at spore-formation, but their experiments gave indications of further complexities. *Sphaerocarpos*, a liverwort, produces spores in tetrads, and of the four, two became males and two females. C. E. Allen states that the female spores

each receive an accessory chromosome larger than that which passes to the male spores. In *Rumex* Kihara has found evidence that the male is cytologically hetero-gametic. Blakeslee showed that *Mucors* consist of several strains which may be called + and —, and that conjugation only takes place when a + culture comes into contact with a — culture. These strains may with great probability be regarded as two sexes, but the results were complicated by the discovery of other strains which are indifferent. We meet here the same difficulty noted in the case of animals, that the factorial relations between hermaphrodite plants and the dioecious forms have not yet been successfully represented. Varieties having the stamens to a greater or less degree aborted are not uncommon among the species of flowering plants which are normally hermaphrodite.

If the deficiency is extreme, the variety is not merely in function female, but it is in a condition morphologically not distinguishable from the females of plants dioecious in the strict sense such as *Lychnis dioica* or *vespertina*. When such female varieties are fertilised with pollen from the hermaphrodite type the resulting family may be a mixture of hermaphrodites and females, but not rarely females only are produced. As the hermaphrodite is a dominant this evidence demonstrates that the hermaphrodite factor must thus be relegated to the female side, the male side taking the recessive in which the anthers are aborted. Such "anisogenous" distribution of the factors may exist in regard to colour, double flowers and probably many other factorial distinctions, and the conception of sex-linkage is in a special and limited sense applicable to them (C. Pellew). Otherwise, save in the one case of *Lychnis*, nothing comparable with the sex-linkage of animals has yet been discovered in plants.

*Chemical Distinctions between the Sexes.*—The search for evidence that the physiological chemistry of the two sexes differs in any fundamental respect, though extensively pursued, has led to little positive result. Lately, however, Manoilov has stated that by the use of certain salts and dyes he has found a method of treating the blood of man and animals and the tissues of dioecious plants in such a way that by the ultimate colour-reaction the sex from which the materials were taken can be distinguished. In this claim there is nothing *a priori* improbable, though before it can be generally accepted repetition and rigorous confirmation must be demanded.

**SGAMBATI, GIOVANNI** (1843-1914), Italian composer (see 24-757), died at Rome Dec. 13 1914.

**SHACKLETON, SIR ERNEST HENRY** (1874-1922), British explorer, was born in Kilkee, Ireland, Feb. 15 1874. Educated at Dulwich College, he entered the mercantile marine service. In Scott's Antarctic expedition of 1901-4 Shackleton acted as lieutenant, but had to return home on account of illness. On Jan. 1 1908 he sailed from New Zealand in the "Nimrod" in command of an expedition which reached a point about 97 m. from the South Pole (see 21,968). On his return in 1909 he was knighted and received the C.V.O. On Aug. 1 1914 he sailed from England on the "Erebus" in command of the unfortunate 1914-7 expedition (see POLAR EXPLORATION). Finally, in Sept. 1921 he set out a third time, in the "Quest." On Jan. 5 1922, off South Georgia Island, he succumbed to an attack of angina pectoris following influenza. He was buried on South Georgia Island. Shackleton gave an account of the 1907-9 expedition in *The Heart of the Antarctic* (1909); and of the 1914-7 expedition in *South* (1919).

See H. Begbie, *Shackleton. A Memory* (1922); A. S. V. Blunt *Shackleton* (1922); H. R. Mill, *The Life of Sir Ernest Shackleton* (1923, new ed. 1924).

**SHAGALL, MARC** (1888- ), Russian painter, was born in Vitebsk, of a family of Jewish artisans. He became, at the age of 20, a pupil of Leon Bakst in St. Petersburg. He went to Paris in 1910, where he stayed four years and exhibited in the "Salon des Indépendants." Under the influence of cubism he painted a series of fantastic pictures, in which he showed extraordinary gifts for colour. On returning to Vitebsk, he painted 60 small pictures, interiors and scenes from Jewish life, in which truth and mystic conceptions were mingled; some of these he exhibited in the "Artistic World." The "Wandering Jew" flying over an orthodox church and the idyllic "Anniversary" (Wiesbaden) finally established his reputation. In 1918 he founded and directed a school of art in Vitebsk; in the following year he executed for the Yiddish theatre in Moscow a series of justly celebrated frescoes. In 1922 he went to Berlin and later settled in Paris. He engraved a cycle of prints entitled "My Life," and made a series of 100 etchings to illustrate Gogol's *Dead Souls*. Exhibitions of Shagall's work have been held in Paris, Berlin and other German cities and New York.

**SHANGHAI, China** (see 24,799), with a population of 1,538,500 in 1923 (including 20,295 foreigners, largely Japanese, in the international settlement), and an area of 8½ sq. m., is the first port of China, and among the first four or five ports in the world in point of tonnage. In spite of the interruption of communications and the impositions caused by the civil wars, trade has steadily increased. The port was entered and cleared by 29,500,000 tons of shipping in 1923, as compared with 19,500,000 tons in 1913. In 1924, however, owing to fighting in the neighbourhood, trade received a setback. British shipping in 1921 exceeded the highest pre-War figure by over 1,000,000 tons, and is still predominant, though the American and Japanese trade has also increased largely.

Shanghai is a great clearing house for all kinds of contraband narcotics, and large quantities are seized yearly. A scheme for the regulation of the river was initiated in 1912 by the Whang-

poo conservancy board, who are responsible for the administration of the port of Shanghai, and considerable work in canalising, dredging, reclamation and surveying has been carried out, the cost being derived from taxes on customs and duty-free goods. The inner and outer bars have been eliminated, and the minimum depth is now over 24 feet. A jetty has been built east of the outer bar; the narrow reach at Nantao was widened and a Bund made in 1915-6; and the sea approaches are now buoyed and lighted. Woosung, at the junction of the Hwangpu and the Yangtse, was created an open port and joined to Shanghai by a motor road in 1919, but has little traffic, as the anchorage is small and exposed. The board acquired its own dredging plant in 1916, and it was increased in 1925 and 1926. Further improvements in port facilities being urgently required, owing to the increase in traffic, a special inquiry was undertaken in 1919, and it was proposed to build a new commercial dock and also to provide mail steamer accommodation at the mouth of the Yangtse River.

Shanghai has grown also as an industrial centre, and has a number of silk, cotton, wool and rice mills, and large engineering and shipbuilding works. In 1920 the government decided to start a mint in the city, but after the buildings were nearly finished and the machinery had begun to arrive the scheme collapsed in 1924, owing to financial difficulties. The substitution of modern offices and houses in place of the old native type is making rapid progress. The older buildings on the Bund have been almost all replaced, and many large houses erected in the west district. An imposing building for the Shanghai club was opened in 1911; a public library in 1913; the municipal buildings on the Hankow road, with a tower 150 ft. high, in 1922; and a customs house of nine storeys was being built in 1925. The general hospital on the north bank of the Süchow creek has been rebuilt, and a statue of Sir Robert Hart was unveiled on the Bund in 1913. There are a number of flourishing foreign banks, and the Chinese banks have made great progress. The Shanghai-Hangchow and the Nanking railway are now connected by a line 8½ m. long, and the line to Ningpo was opened in 1912.

There was fighting near Shanghai in 1924 and 1925, and the volunteer corps had to be mobilised to protect the British settlement. Much trouble was experienced with refugees and retreating soldiery. Early in 1925 a strike at large Japanese mills led to anti-foreign demonstrations and attacks on mills and the police station. In June a general strike was declared, and the essential services had to be carried on by volunteers. A force was landed to protect foreign interests.

**SHANNON, CHARLES HAZELWOOD** (1865— ), British painter (*see* 24.801), was elected R.A. in 1920.

**SHANNON, SIR JAMES JEBUSA** (1862-1923), Anglo-American artist (*see* 24.801), died in London March 6 1923. He was knighted in the previous year.

**SHANNON** (*see* 24.801).—One of the first matters to engage the attention of the Government of the Irish Free State was the provision of cheap electrical power. Several proposals having been considered, it was decided that power could be most economically produced by the construction of a central generating station capable of utilising the immense resources of the Shannon. Messrs. Siemens-Schückert prepared a plan and an estimate for the construction of such a station, and their proposal was submitted to four independent experts of European reputation, who approved its main features subject to minor modifications. The scheme was formally adopted by the Government and received the approval of the legislature.

*Outline of the Scheme.*—The preliminary operations were commenced in 1925. The scheme provided for the development of hydroelectric power from the Shannon in three stages—called the partial development, the further development and the full development respectively. In the partial development, which was considered sufficient to meet the requirement of the Free State for five or six years, three turbines, each of 30,000 H.P. were projected; in the further development six turbines all of the same capacity; while in the full development the turbine capacity would not be increased but additional storage would be provided.

In the partial development Lough Derg alone was to be used for storage, but the winter level would not be raised. In the further development the storage in Lough Ree and Lough Allen would be added; and in the full development the storage in Lough Derg would be increased by raising the level of the lake above winter high water level. The head race constructed for the partial development was to be the size necessary for the full development; but the tail race, which is mostly in rock, would be enlarged for the further development.

In the Shannon the period of maximum flow coincides with that of maximum demand, thereby reducing storage requirements. On the other hand, as the fall from Lough Derg to the sea is gradual, it was necessary to construct a long head race in order to obtain an adequate fall. The Siemens-Schückert project contemplated utilising the total fall of 100 ft. between Lough Derg and Limerick in a single large step, by leading the water out of the river bed into an inlet canal, or head race, to leave the Shannon at Parteen, above O'Brien's Bridge, and to extend a distance of about 6½ m. to Ardnacrusha, where the power station was to be situated. Here the water was to be conducted to the turbines by large steel pipes 20 ft. in diameter and 140 ft. long and carried back to the Shannon in a tail race 1¼ m. in length. In order to prevent the water backing up the tail race, and so reducing the head in times of heavy flow, the river would be deepened at several points below the mouth of the tail race. The electric energy produced in the power station would be transmitted by means of a high tension network to most of the towns and villages of the Free State with a population of over 500. A 100 kv. transmission line in duplicate would run from the power station to Dublin, and a single 100 kv. line from the power station to Cork, where 100 kv. transformer stations would be erected; and, in the further development, an auxiliary station would be added at Maryborough. From the power station and these three centres a 35 kv. network would radiate in a closed ring formation, so that all stations would be fed from two directions. A further 10 kv. network, also constructed on the closed ring system, would complete the scheme of distribution.

*Cost of the Scheme.*—The capital outlay was estimated at £5,200,000 for the partial, £7,700,000 for the further and £8,000,000 for the full development; and the annual expenses, including interest on capital at 5½%, amortisation spread over 40 years, maintenance and management at £493,000, for the partial development and £661,000 for the further development. The price at which electricity could be supplied to the consumer would depend upon the density of population in the locality and upon the volume of the general demand. It was estimated that the wholesale price of electric power supplied in bulk at Dublin and Cork should be about 0.6d. and at the end of the 10 kv. lines about 2.5d. Ultimately the current might be supplied at a flat rate, in which case the wholesale price everywhere should be less than 1d. per unit. These figures are considerably less than the costs at the commencement, and the price might be expected continuously to decrease with the growth in the demand for current. It was calculated that the scheme should return from 5½ to 7% upon the invested capital, provided out of public money.

*Benefits of the Scheme.*—The success of the scheme will depend largely upon the growth of effective demand for current. At first the Free State was very backward in its use of electricity both for industrial and domestic purposes. Both Siemens-Schückert and the experts who advised on the scheme were of opinion that the supply would create a very rapid growth in demand. Cheap light, heat and power for domestic consumption would be provided; and also power for large and small scale industry, particularly mills and creameries. It was hoped that farmers would use the power to light their premises and to drive farmyard machinery, and that the growth of manufacturing industries of an electro-chemical nature would be stimulated. The electrification of the railway system, apart from suburban lines with heavy traffic, was not contemplated. The organisations for the distribution of electricity would continue to operate as heretofore, except that instead of generating their own power they would purchase it in bulk from the power developed from the Shannon.

*Effects on the River.*—It remains to consider the effects which the Siemens-Schückert Scheme would have on (a) the drainage, (b) the navigation and (c) the fisheries of the Shannon. As regards drainage, it was claimed that the partial development, in which the winter level of Lough Derg would be maintained for about five months of the year, would by reason of the embankments to be erected, save from 3,000 to 4,000 acres of land from annual flooding; and that the later stages of development, in which the storage capacity would be increased and the consequent embankment extended, would save a further large area. The drainage of the Shannon basin would therefore be improved by the scheme. As regards navigation, it was proposed that there should be erected beside the power station a ship's hoist, and that the head race and tail race should be utilised by boats proceeding up and down the Shannon. The complete protection of the fisheries from damage was admitted to be impossible, but everything possible was to be done to minimise the injury that would be inflicted, and provision made in the scheme for compensation to fishery interests.

**BIBLIOGRAPHY.**—Full particulars of the Shannon Scheme are to be found in *The Electrification of the Irish Free State; The Shannon Scheme Developed by Siemens-Schückert and The Report of the Experts appointed by the Government, Stationery Office, Dublin; Dail Eireann, Debates, Official Report, vol. 10 and 11.* (G. O'B.)

**SHANTUNG** (see 24.803, and CHINA).—A maritime province of northeast China, bounded north by Chihli Province, east by the Gulf of Pechili and the Yellow Sea, west by Honan and south by Kiangsu. It is one of the most densely inhabited provinces of China, its area being 55,984 sq. m. and population 30,803,245 (Post Office estimate, 1923). Historically, Shantung was originally composed of the kingdoms of Ch'i and Lu, both of which names are still retained in various provincial organisations. As the birthplace of Confucius and Mencius, Shantung has always occupied a unique place in the affection of the Chinese people. The grave of Confucius is situated in the southern part of the province, in the picturesque temple of Ch'ü-fu.

**Production.**—The main agricultural products are millet, corn, barley, sorghum, maize, beans, peas, cotton and tobacco. Peanuts are now widely cultivated, and, with the soya bean, form valuable articles of export on account of the oils which they contain. The chief trees are the pine, poplar, willow, oak, cypress and mulberry, whilst the main fruits are pears, apples, peaches, apricots, persimmons, grapes and plums.

Shantung is very rich in minerals. Coal is found in four main regions—in the neighbourhood of Weihsien, Chih-chuan, Poshan and I-chow respectively—whilst iron, copper, gold, lead, gypsum, clay and sandstone have also been discovered.

**Industry and Communications.**—Within recent years Shantung, which is primarily an agricultural province, has greatly increased its industries (which consist chiefly of sericulture, glasswork, pottery, mining, strawbraid, paper and cotton mills) and has improved its means of communication. In addition to the two main railways (the Tsin-Pu and Shantung railways), which traverse the province in a north and south and easterly direction respectively, other lines have been surveyed, the most important of which will connect Chefoo and Weihsien. Several hundred miles of motor roads (for the most part non-metalled) have been built within the last few years, and on some of these (notably the Cheff-Weihsien road) regular services of motor vehicles are now maintained.

**Chief Towns.**—Tsinan, capital of the province, is situated at the junction of the two main railways and is a growing city of about 300,000 inhabitants. A large portion of the city has been laid out on modern lines, with broad macadamised roads and a number of modern shops and residences. The Shantung Christian University, one of the largest international universities in China, is situated in this city. The other chief towns are Weihsien, Tsinningchow, Tsaochowfu, Chefoo and Tsingtau.

**Political History.**—The province of Shantung obtained an international reputation during the years immediately following the World War, owing to the difficulties attending the rendition of the Kiaochow territory seized by Germany in 1897 (see 24.803). The territory remained in the hands of the Germans, who spent large sums of money improving and developing the colony, until Nov. 1914, when it was captured by the Japanese. It was understood that it was to be handed back to the Chinese Govt. at the conclusion of the War, but the Treaty of Versailles confirmed Japan in the possession of the territory. As a result, the Chinese representatives at the Peace Conference refused to sign the Treaty, and an intense anti-Japanese boycott took place all over China. The whole question was carefully considered at the time of the Washington Conference in 1921-2 and prolonged negotiations followed. Through the mediation of the Earl of Balfour (then Mr. Balfour) and Mr. C. E. Hughes, these negotiations were brought to a successful conclusion, the whole territory, including the various public buildings and the Shantung railway, being handed back to China during 1922 in return for Yen 56,000,000 (see CHINA; JAPAN).

See H. W. V. Temperley, *History of the Peace Conference at Paris, vol. vi., pp. 391 et seq. (1920 et seq.)* For the text of the 1922 treaty see *Bulletin of Association for International Conciliation, No. 172, (March, 1922).* (H. BA.)

**SHARP, CECIL JAMES** (1859-1924), British musician and writer, was born in London Nov. 22 1859. He was educated at Uppingham and at Clare College, Cambridge and, in 1883 went to South Australia where he founded a school of music at Adelaide. He was principal at the Hampstead Conservatoire, London, from 1896-1905, and director of the English Folk-Dance Society which he founded in 1911. He performed valuable work in collecting and arranging English folk-songs and dances, as well as in lecturing on the same subjects; and the renewed interest in English folk-songs was largely owing to his efforts. During his visit to America he discovered in the Appalachian Mountains interesting survivals of old national melodies. He died in London June 22 1924.

Among Sharp's numerous publications may be mentioned: *A Book of British Song* (1902); with C. L. Marson, *Folk Songs from Somerset, series 1-5 (1904-19); Folk Songs for use in Schools sets 1-10; English Folk Songs from the Southern Appalachians (1917); American English Folk Songs, etc.; English Folk Songs, 2 vol. (1921); Posthumum with A. P. Oppé, The Dance, an Historical Survey of Dancing in Europe (1924).* See Winifred A. S. Shaw, *Cecil Sharp, an Appreciation (1925).*

**SHAUGHNESSY, THOMAS GEORGE SHAUGHNESSY, 1ST BARON** (1853-1923), Canadian railway magnate, was born at Milwaukee Oct. 6 1853. Educated at St. Gall's academy, Wisconsin, he began railway service at the age of 16, and in 1882 joined the staff of the Canadian Pacific Railway as general purchasing agent. In 1891 he was appointed a vice-president and from 1899 to 1918 he was president and chairman of the board of directors, as well as director of all the allied lines. Knighted in 1901 and created K.C.V.O. in 1907, Shaughnessy was raised to the peerage of the United Kingdom in 1916 as Baron Shaughnessy of Montreal and of Ashford, County Limerick. He was deeply interested in the development of Catholic schools in Montreal, and in 1917 raised a fund of \$200,000 for building and development purposes. For many years he exerted his influence in favour of union between Canada and Newfoundland. He died in Montreal Dec. 10 1923.

**SHAW, ANNA HOWARD** (1847-1919), American reformer, was born at Newcastle-upon-Tyne Feb. 14 1847. When she was a small child her parents moved to the United States. From 1872 to 1875 she studied at Albion College, Mich., and in 1878 graduated from the theological school of Boston University. The district conference of the Methodist Episcopal Church granted her a local preacher's licence, but the New England Conference of the M.E. Church refused to ordain her because of her sex, and the refusal was upheld by the General Conference at Cincinnati in 1880. The same year she was ordained in the Methodist Protestant Church. While preaching she had studied medicine and received the degree of M.D. from Boston University in 1885. In 1886 she became national superintendent of franchise of the Women's Christian Temperance Union, serving for six years. She was also associated after 1886 with the National American Women's Suffrage Assn. in various capacities, and from 1904-15 as president. She was a member of the International Council of Women, the International Suffrage Alliance, the National Society for Broader Education and the League to Enforce Peace. In 1917 she was chairman of the woman's committee of the Council of National Defence. She died at Moylan, Pa., July 2 1919. She was the author with Elizabeth Jordan of *The Story of a Pioneer* (1915).

**SHAW, GEORGE BERNARD** (1856- ), Irish dramatist, was born in Dublin July 26 1856. His father, George Carr Shaw, was an impoverished and humorously helpless member of what, in England, would have been called the middle class, but in Ireland is still called the gentry. He was first employed by the Government in the Four Courts, then the Dublin Law Courts, and when his office was abolished in 1850 compounded his pension for a lump sum, with which he became a member of the Dublin Corn Exchange, engaging in a business of which he was totally ignorant, that of a wholesale corn chandler. He married Lucinda Elizabeth Gurly, the daughter of Walter Bagenal Gurly, a landed proprietor in County Carlow. Three children were born of the marriage, Lucinda Frances, Elinor Agnes and George Bernard.

The financial affairs of the Shaw family did not prosper, but the young wife, who had a *mezzo soprano* voice of remarkable purity, became known as an amateur singer. There was then in Dublin a gifted conductor and teacher of singing, named George John Vandaleur Lee, with whose work Mrs. Shaw became associated. In this way the Shaw children, despite their father's financial straits, acquired a considerable musical culture which was extended to the theatre by her amateur operatic performances. Her son, after a private grounding in Latin grammar from his uncle, the Rev. William George Carroll, vicar of St. Bride's, Dublin, who was reputed to be the first minister of the Church of Ireland to proclaim himself a Home Ruler, was like many other Church of Ireland children, sent to the Wesleyan Connexional School, later known as Wesley College, in Dublin, and was "generally near or at the bottom of his classes." At home however, he acquired an extensive acquaintance with the works of composers of music, so that before he was 15, "he knew at least one important work by Handel, Mozart, Beethoven, Mendelssohn, Rossini, Bellini, Donizetti, Verdi and Gounod from cover to cover." He studied pictures in the National Gallery of Ireland, and at 15 "knew enough of a considerable number of painters to recognise their work at sight."

In 1871, when he was 15 and had no hope of going to a university, he received, through the influence of his uncle, Frederick Shaw, an appointment in the office of a Dublin land agent, Charles Uniacke Townshend, at a commencing salary of £18 per annum. At the end of a year, when he was 16, the important post of cashier unexpectedly became vacant, and he was temporarily appointed to it. He filled it so ably that he was confirmed in it, and his salary, then £24 per annum, was doubled. In 1876, no longer able to endure employment which had always irked him, he withdrew from it and joined his mother, who, some years earlier, had settled in London and become a professional teacher of music. But before he did this he made his first communication to the Press. The American evangelists Moody and Sankey had arrived in Dublin to conduct a revival, and he went to hear them deliver their gospel. After he had heard it he wrote a letter, signed "S.," and dated April 3 1875, to *Public Opinion*, in which he asserted, to the horror of his pietistic relatives, that if this sort of thing was religion then he, on the whole, was an atheist.

The first nine years of his life in London were passed in poverty and oppressed to some extent by a sense of failure. His literary earnings in that time amounted to six pounds. "When people reproach me," he wrote in 1896, "with the unfashionableness of my attire, they forget that to me it seems like the raiment of Solomon in all his glory by contrast with the indescribable seediness of those days, when I trimmed my cuffs to the quick with scissors, and wore a tall hat and *soi-disant* black coat green with decay." In those nine years, 1876-85, he "devilled" for a musical critic; began a Passion Play in blank verse which he did not finish; wrote an article for *One and All*, of which George R. Sims was editor, the payment for which was 15s.; wrote an article for patent medicines for £5, and a verse for a school prizebook for 5s.; and composed five novels. He was supported during these nine years by his mother, and by his father, who was still struggling with his dwindling business on the Dublin Corn Exchange. On a few occasions he endeavoured "to earn an honest living," the last occasion being in 1879, when, for a few months, he was in the service of a company formed in London "to exploit an ingenious invention by Mr. Thomas Alva Edison." Thereafter he insisted on following the bent of his mind. "I did not throw myself into the struggle for life: I threw my mother into it. I was not a staff to my father's old age: I hung on to my father's coat tails. . . . Callous as Comus to moral babble, I steadily wrote my five pages a day and made a man of myself (at my mother's expense) instead of a slave." Such glimpses of London society as he obtained he owed to the possession of a suit of evening clothes and to his being a sufficiently sympathetic accompanist to be tolerated as an amateur in musical circles.

Between 1879 and 1883 the five novels were written—one each year. The first was, "with merciless fitness," called *Immaturity*.

It was declined by Chapman and Hall, the publishers, who wrote "No" on it, and it has never been printed. The manuscript was thrown aside and nibbled by mice, but "even the mice failed to finish it." *The Irrational Knot*, *Love Among the Artists*, *Cashel Byron's Profession*, and *An Unsocial Socialist* followed it. No publisher would accept them, and it was not until after he had made many friends in advanced political and humanitarian circles that any of them were printed.

In 1882, when Bernard Shaw was 26 and the author of four unpublished books, he attended a public meeting at the Memorial Hall, Farringdon Street, London, which was addressed by Henry George on the subject of land nationalisation. George believed that the social ills of mankind would be cured by the nationalisation of land, or single tax: all other forms of capital could safely be left in private possession. Shaw resolved to join in George's campaign, but he did not long remain in it, for, on proceeding from a study of George's *Progress and Poverty* to Marx's *Capital* he became a Socialist and demanded the nationalisation of all forms of capital, a demand which was repugnant to George. In this campaign Shaw made a number of firm friendships: with James Leigh Joynes, Sydney Olivier (later Lord Olivier), Henry Hyde Champion, the Rev. Stewart D. Headlam, Henry S. Salt and his wife, William Morris, Annie Besant, Edward Carpenter and Sidney and Beatrice Webb.

Propaganda magazines inevitably followed in the trail of these friends; and in one of them, printed by Champion and called *To-day*, *An Unsocial Socialist* and *Cashel Byron's Profession* were serialised. *To-day* died, and was succeeded by *Our Corner*, published by Mrs. Besant, with whom Shaw had become acquainted about the time that he joined the Fabian Society, a society of Socialists founded in 1883. *The Irrational Knot* and *Love Among the Artists* were serialised in this magazine. It, too, died. *Cashel Byron's Profession* had an artistic, but not a popular, success. Stevenson was enraptured by it, and Henley wanted to make a play out of it. Shaw himself, some years afterwards, burlesqued it for the stage under the name of *The Admirable Bashville*, in excellent blank verse.

It was abundantly clear in these novels, written after the style of the 18th century authors, that narrative was *not* the form in which Shaw could best express himself. He ran to dialogue rather than to description or to narrative, and his characters on any or no provocation uttered long speeches that read like platform deliveries rather than conversation. The *story* was always a poor one when there was any story at all; the author was not fastidious about the peg on which he hung his opinions. He shared with Shakespeare a willingness to use any plot that would serve his purpose. But he could not continue to use a form which was intractable in his hands, and so, after many diversions and adventures in search of a suitable instrument, he turned to the stage. It may here be said, however, that the novels were a preparation for the plays. Much of what is in the former was re-used in the latter. The hatred of hypocrisy and pretentious respectability and irrational social cleavages and stupefying poverty and every kind of organised priestcraft, whether of the law or the Church or of medicine or of politics, which he acquired in Dublin as a boy and a youth, was poured into his novels and distilled from them into his plays. Ann Whitefield, who takes the initiative in the sex duel with John Tanner in *Man and Superman*, is descended from Madge Brailsford who hunts down Owen Jack in *Love Among the Artists*. The conclusion of *Love Among the Artists*, as Julius Bab has pointed out, is almost identical in situation and words with the conclusion of *Candida*.

His fortunes now began to mend. He criticised books for the *Pall Mall Gazette* and pictures for *The World*. He was appointed musical critic of the *Star*, under the pseudonym of "Corno di Bassetto," but he presently transferred himself in the same capacity to *The World*, in which he made his initials G.B.S. familiar to the public. Later on he acted as dramatic critic of *The Saturday Review*. During this period of critical activity, however, he was arduously engaged in his political propaganda. Henry George's *Progress and Poverty* directed his attention from the so-called controversies between science and religion to political

economy, to which he devoted several years of study; Karl Marx's *Das Kapital*, which he read in French, completed his disillusion with capitalistic civilisation. He took up public speaking and incessantly addressed "audiences of every description, from University dons to London washerwomen. From 1883 to 1895, with virtually no exception, he delivered a harangue with debate, questions and so on every Sunday—sometimes twice or even thrice—and on a good many weekdays. This teeming and tumultuous life was passed on many platforms, from the British Association to the triangle at the corner of Salmon's Lane in Limehouse." He was now a most active member of the Fabian Society, which he joined in 1884; and was the author of its second and third Tracts.

In 1898 Shaw's health yielded under the weight of his work and he was obliged to refrain from addressing meetings almost nightly. He became, instead, a co-opted member of the Vestry of St. Pancras, afterwards St. Pancras Borough Council. He was invited, but declined, to become a candidate for Parliament. His chief political activities were done in committees of the Fabian Society. By this time he was well known as a brilliant and witty critic and debater, but was hardly known at all to the generality of people as an author, although, in addition to his novels, he had written *The Sanity of Art* (1908), a reply to Dr. Max Nordau's *Degeneration; The Perfect Wagnerite* (1898); *The Quintessence of Ibsenism* (1891); and four plays.

But from 1894 his rise to world fame was steady and swift. He now definitely was a dramatist, although he still did an immense amount of journalism and political propaganda and published his plays for general reading (then an innovation in London) with elaborate prefaces on political, social and finally on religious and biological questions, which were quite independent of the plays to which they were attached. It was as an acted dramatist that he entered into the knowledge of the ordinary man.

At the time of writing (1926), his plays, long and short, number 34. They are as follows, and, as nearly as possible, in the order of their writing: *Widowers' Houses* (1893); *The Philanderer*; *Mrs. Warren's Profession*; *Arms and the Man*; *Candida*; *The Man of Destiny*; *You Never Can Tell*; *Captain Brassbound's Conversion* (1901); *Caesar and Cleopatra* (1901); *The Devil's Disciple* (1901); *The Admirable Bashville* (1909); *Man and Superman* (1903); *John Bull's Other Island* (1907); *Major Barbara* (1907); *How She Lied to Her Husband* (1904); *Passion, Poison and Petrification, or, The Fatal Gazogene* (1905); *The Doctor's Dilemma* (1906); *The Interlude at the Playhouse*; *Getting Married* (1908); *The Shewing-up of Blanco Posnet* (1909); *Press Cuttings, A Topical Sketch compiled from the Editorial and Correspondence Columns of the Daily Papers* (1909); *Misalliance* (1910); *The Dark Lady of the Sonnets* (1910); *Fanny's First Play* (1911); *Androcles and the Lion* (1912); *Over-ruled* (1912); *Pygmalion* (1912); *Great Catherine* (1913); *Heartbreak House* (1917); *O'Flaherty, V. C.* (1915); *Annajaska, the Bolshevik Empress* (1917); *The Inca of Perusalem*; *Augustus Does His Bit* (1916); *Back to Methuselah* (1921); and *Saint Joan* (1923). He also made translation of Siegfried Trebitsch's *Frau Gitta's Sühne*, under the title of *Jitta's Atonement*.

The first of these plays was finished in 1892, seven years after it had been begun in collaboration with William Archer. Shaw, it seemed, could write "incomparable" dialogue but "construction was not his strong point"; Archer "could not write dialogue a bit, but... considered himself a born constructor." They agreed to pool their abilities and make a play. Archer constructed "a twaddling cup-and-saucer comedy... to be called *Rhinegold*." But Shaw held that plot was the curse of fiction, literary or dramatic; and Archer was the apostle of plot and construction. Consequently the plot, in Shaw's hands, underwent such a change that Archer retired from the collaboration, nor did he ever expect to see the play completed. Seven years later, to help the Independent Theatre out of an emergency, Shaw finished the play—a treatise on slum-property—and it was performed for the first time in Dec. 1892. Archer, then dramatic critic for *The World*, earnestly endeavoured to dissuade Shaw from following a career as a dramatist, "for which

he has no special ability, and some constitutional disabilities." The last of the plays, *Saint Joan*, was written in 1923. It will be seen, then, that the bulk of Shaw's dramatic work was done after he had passed his 40th birthday, and that half of it was done after he had reached the age at which Shakespeare died. It will also be seen that the three plays which are now considered to be his greatest, *Heartbreak House*, *Back to Methuselah* and *Saint Joan*, were written when he was well over 60 years of age. Three of the plays, *Mrs. Warren's Profession*, *The Shewing-up of Blanco Posnet* and *Press Cuttings* were banned by the censor, but the ban was subsequently lifted from them. *Passion, Poison and Petrification* is a burlesque melodrama written for the benefit of the Actors' Orphanage. The *Interlude at the Playhouse* is a topical prologue quoted at length in the *Daily Mail*, Jan. 29 1907, and not otherwise published. His political writings, in addition to a number of Fabian tracts and pamphlets, include *Common Sense About the War*, *Peace Conference Proposals* and *The Intelligent Woman's Guide to Socialism and Capitalism*.

The plays vary from exposure of social wrongs, as for example slum ownership in *Widowers' Houses* and prostitution in *Mrs. Warren's Profession*, to philosophical and religious disquisitions, as in *Misalliance* and *Androcles and the Lion*, *Heartbreak House*, and metabiological prophecies, as in *Back to Methuselah*, dramatised historical chronicle, as in *Caesar and Cleopatra* and *Saint Joan*. Shaw has ranged through a great variety of scenes in his plays—America, Bulgaria, Egypt, England, France, Germany and Ireland; and he is always careful to make the settings as picturesque and romantic as possible. He goes to extraordinary lengths to introduce oddity into his work, as when he makes Captain Shotover, in *Heartbreak House*, live in a house shaped like a ship, and causes one of the characters in the play to wear the clothes of an Arab chief in the evening. At first, his work seemed to express an absolute determinism—not man, but his environment, was at fault—but in his later plays he insists, in Macbeth's phrase, that man "still has judgment here," and expresses what may be called a neo-Protestant belief. Mankind, in *Back to Methuselah*, reaches through creative evolution a state of longevity which resembles eternal life. Joan of Arc protests that no one shall stand between God and her.

The general religious belief expressed in the plays may be briefly summarised as follows: God, or the Life Force, is an imperfect being striving to become perfect. If He were omniscient, omnipotent and omnipresent, He would not tolerate certain horrors in the lives of His creatures, any more than an ordinary father would tolerate disease in his children if he could prevent it. The whole of time has been occupied by God in experiments with instruments invented to help Him in his attempt to perfect Himself. When He found that these instruments were either useless or no longer serviceable He scrapped them. In this way the disappearance from the world of mammoth beasts, among other creatures, is explained. God eventually found that all His instruments suffered from a common defect, that they were unaware of His purpose and were unable to help Him of their own volition. He thereupon created a new creature, Man, and made him aware of His purpose and gave him a will so that he might deliberately help Him to achieve perfection. Man, in short, can help or hinder God in His efforts to fulfil Himself. All the cruel and wicked things in life are explicable to Shaw as acts of rebellion against God or the consequences of indolent failure to help Him. Disease, poverty, war—all of these are acts done against God by man; and Shaw warns the world that if it will not amend its ways, and endeavour to fulfil God's purpose, He will become impatient and scrap mankind as He scrapped the mammoth beasts. "You should live so that when you die God is in your debt." In 1898, after he had retired from regular journalism, he married Charlotte Frances Payne-Townshend.

**SHAW, RICHARD NORMAN** (1831-1912), British architect (see 24.813), died at Hampstead, London, Nov. 17 1912.

**SHEFFIELD, England** (see 24.822), had a population of 490,639 in 1921 (511,668 including districts incorporated in that year); it was estimated at over 500,000 in 1925. The borough was enlarged by the inclusion of part of Tinsley in 1911 and part of Bradfield in 1914; and in 1920 powers were sought to include a very large area for the purposes of a bold scheme of regional devolution. The area of land incorporated (in 1921), though less than had been hoped, amounted to 6,697 ac. (making the total area of the borough 31,627 ac.), and included Handsworth and parts of Ecclesfield and Brinsworth. A new ward, that of Handsworth, was created, and four members added to the city council. The old boards of guardians of Sheffield and Ecclesfield were dissolved in 1925, and a united board established. Seven members have been returned to Parliament since 1918. The milk supply was municipalised in 1918. An exhaustive civic survey has been carried out, and a zonal town plan prepared; authority for applying the plan to an area of 5,909 ac. was obtained in 1925. Parks and open spaces acquired largely by gift or purchase from the late Duke of Norfolk and his trustees, include Norfolk Park (52 ac.); Buckwood (16 ac.); Bingham and Greystones Parks, Rustlings Road; Luxton Chase (75½ ac.); Blackbrook, Coppice, Hutcliffe and Bowden Houstead woods (altogether 176 ac.); and Woolley Wood, Wincobank; while 154 ac. of the Norton Hall estate were acquired in 1925 adjoining the site presented in 1924 to the joint hospitals council, and Brinkcliffe Tower, with 12 ac., has been given for use as a park after the death of the donor. The total area of parks and open spaces is 1,331 ac. (1,163 in the city itself). Crookes cemetery was acquired in 1910, and 84½ ac. for another at Shire Green in 1925.

In 1914 Sheffield was created a diocese, consisting of the archdeaconries of Sheffield and Doncaster, with that part of the rural deanery of Dronfield which was within the city boundaries. The old parish church of St. Peter and St. Paul became the cathedral. New churches include St. Oswald's, Millhouses (1910); St. Chad's, Norton Woodseats (1912); St. Aidan's Park (1913); St. Clement's, Newhall (1914); St. Margaret's, Jenkin Road (1918); a Swedenborgian church (1912); and the central synagogue, Lee Croft (1914).

The Jonas and Edgar Allen laboratories in connection with the university were opened in 1923, and a hostel for men in Taptonville road in 1912. It was proposed in 1924 to amalgamate and extend the four voluntary hospitals, utilising the present buildings as receiving wards and casualty stations, and carrying on the main work in Norton Hall, which was given, with 120 ac. of land, for the purpose. A new wing of the Royal Infirmary was opened in 1925. New buildings and monuments include the boys' Bluecoat school in Psalter lane (1911); the coroner's court (1914); a statue of King Edward VII. in Fitzalan square (1913); a memorial to men of the Yorkshire and Lancashire regiment in Weston Park; and a War memorial, consisting of a steel mast on a bronze base, in Barker's Pool (1925). A village with a painted fabrics industry for ex-service men has been established at Coal Aston, on the outskirts of the city, and the erection of a large War memorial public hall was to be undertaken in 1926. A new wing of the town hall was opened in 1923, and it was decided in 1925 to build modern abattoirs.

In connection with the Derwent valley water scheme, for utilising the water of the Derwent and Ashop rivers, the Howden reservoir was opened in 1912, and the Derwent reservoir and the service reservoir at Ambergate were finished by 1926. The complete scheme involves about 80 m. of aqueducts, and a tunnel four miles long connecting the new works with those of the corporation at Rivelin. The dams are over 1,000 ft. long, and 100 ft. high from the river bed. Sheffield receives 25% of the water, the rest going to Derby, Leicester, Nottingham and country districts.

**SHEFFIELD, UNIVERSITY OF** (see 27.771).—Since 1910 the following new chairs have been provided: geology, civic art, pharmacology, modern history, fuel technology, glass technology, civil engineering, economics, Greek and international law. New

departments have been opened since 1910 for Russian, Spanish, civic art, geology, glass technology, refractories, pharmacology. Degrees and diplomas have been instituted since 1910 in philosophy, technical science, dental surgery, together with an associateship in non-ferrous metallurgy. In conjunction with the University of Leeds a marine zoological laboratory was opened at Robin Hood's Bay. Special posts in physiology and pathology have been established. The holders serve the university and the local hospitals. A chair of pharmacology was founded in 1920 and a field laboratory built and equipped for them.

The university buildings have been considerably enlarged. Two new research laboratories, one for engineering and one for metallurgy, have been built and equipped. In 1919 a union for men students was opened, and in 1920 a union for women students was established. The number of tutorial classes held in conjunction with the Workers' Educational Association has rapidly increased. The research work undertaken in connection with local trades is increasing, especially in connection with the manufacture of steel and cutlery, and glass technology. In the mining department research on problems arising in the industry is carried on and the department of fuel technology deals with problems in fuel.

From 1910-1 the numbers of full-time students showed a steady increase. The first year of the War brought a decrease which continued until 1917. The numbers grew rapidly, due to the influx of ex-service men, and in 1920-1 there were nearly five times as many full-time degree and diploma students as in 1917-8. The number of women students taking full-time courses has increased considerably.

**Finance.**—Donations amounting to £137,869 have been received for general buildings and endowment and £43,760 was received for buildings and departments for coal mining and non-ferrous metallurgy. Important benefactions have been received from Viscount Bearsted (£10,000), Mr. Edgar Allen (£41,397), the late Mr. Ezra Linley of St. Louis, Miss. (£10,485), Alderman Robert Styring LL.D. (£20,000) and Messrs. George Senior and Sons, Ltd. (£5,000). The subsidy from the South Yorkshire Coal Trade Assn., which in 1913-4 was £200, amounted in 1924-5 to £4,418.

**SHERMAN, JAMES SCHOOLCRAFT** (1855-1912). American politician, was born near Utica, N. Y., Oct. 24 1855. He graduated from Hamilton College in 1878, was admitted to the Bar in 1880, and practised in Utica until 1907. He was elected mayor of Utica in 1884. In 1886 he was elected to the National House of Representatives and was returned continuously until 1908, excepting the term 1891-3. He was a delegate to the National Republican Convention in 1892; chairman of the Republican State Convention in 1895, 1900 and 1908; and chairman of the Republican National Committee in 1906. At the Republican National Convention of 1908 he was nominated vice-president and was elected on the ticket with William Howard Taft. Four years later he was renominated, but died at Utica Oct. 30 1912, shortly before the elections.

**SHERRINGTON, SIR CHARLES SCOTT** (1861- ), British physiologist, was educated at Caius College, Cambridge, afterwards becoming lecturer in physiology at St. Thomas' Hospital, London, and later professor of pathology at London University. From 1895-1913 he was professor of physiology at Liverpool University, proceeding subsequently to Oxford as Waynflete Professor of physiology. He became a leading authority on the physiology of the nervous system, and the guiding principles of his work are to be found in his book, *The Integrative Action of the Nervous System*, based on the text of the Silliman lectures delivered at Yale in 1904. He was the recipient of numerous British and foreign awards and honours, including the Royal Medal of the Royal Society, of which he was president from 1920-5, the Baly Gold Medal of the Royal College of Physicians, and the Retzius Gold Medal of the Royal Swedish Academy. During the World War he served on the War Office committee on tetanus; in 1918 he became chairman of the Industrial Fatigue Research Board, and in 1925 a member of the Medical Research Council. He received the G.B.E. in 1922, and the O.M. in 1924.

His publications include, *A Manual of School Mammalian Physiology* (1919), numerous papers to the Royal and other scientific societies on the brain and nervous system, and *The Assaying of Brabantius and Other Poems* (1925).

**SHEVKET, MAHMUD** (1858-1913), Turkish pasha, was born at Baghdad, and from early youth showed marked qualities of intellect and personality. He received his military training at the military college in Constantinople, 1875-80, and after a very brief period of service with the troops was given an appointment on the general staff. Through the influence of Von der Goltz, who at that time was reorganising the Turkish Army, Shevket was sent to Germany to manage the re-equipment of the Turkish Army. As a result, he remained from 1884 to 1894 in the small arms factory of Mauser Bros., at Oberndorf, on the Neckar, and in 1894 was made inspector of military arsenals in Constantinople. From 1901 to 1903 he was military governor of the Hejaz, in Arabia, then in what amounted to a state of war. He next went in a like capacity to Uskub (Skoplje), and there came in contact with the Young Turk movement, which had its headquarters in Salonika. In the spring of 1909 the Old and Young Turks were struggling for supremacy. A powerful Old Turk counter-revolution was prepared, but, in mid-April, the III. Army Corps, under Hussein Husni Pasha, marched from Salonika against Constantinople. At San Stefano Mahmud Shevket took over the command, and, after heavy fighting, forced his way on April 4 into Constantinople.

Impressed by his victory, the National Assembly no longer dared to oppose the will of the Young Turks, and on April 26 voted the deposition of Abdul Hamid. Mahmud Shevket was the hero of the day. But he did not care for politics, which he considered had been the ruin of the Turkish corps of officers, and preferred to confine his activities to purely military matters. The next few years afforded him plenty of opportunities. In 1910-1 he put down a revolt of the Malissors with great energy, and in 1912 fought against the rebels in Albania. In the summer of 1912 he became Minister of War, and in Jan. 1913 succeeded Kiamil as grand vizier. He took a very active part in army reforms, but he came into conflict with the Union Libérale, which took its orders from Sherif Pasha in Paris, and he was murdered by one of its members on June 11 1913.

**SHIBUSAWA, EI-ICHI**, VISCOUNT (1840- ), Japanese financier and business man was born in Saitania-Ken. He began his career as an official of the Tokugawa Shogunate and in the company of a Tokugawa prince visited Europe in 1867-8. When the Imperial Govt. was established, he entered the Treasury Department, but retired in 1873 to become a banker. He founded in that year the First National Bank (Dai-ichi Ginko) and was chairman of the Tokyo chamber of commerce from its inauguration until 1915, when he retired from active business owing to ill-health.

**SHINTOISM.**—Shintō or "*Kami-no-Michi*" (The Divine Way) (see 15,222a) which is the religion of Japan, still living among the Japanese people, is a designation given to the religious belief indigenous to the soil of Japan, in contradistinction to Buddhism, officially introduced into Japan in A.D. 552. The first documentary appearance of the term Shintō is in the Book of the Emperor Yōmei (died in 587) in the *Nihongi* (Aston, English translation, vol. 1., p. 106). Thus Shintō is peculiar to the Japanese mind.

Shintō has two main stages in the course of its development: one is naturalistic, the other cultural. In the two phases of its development, the one gives us an aspect of nature religion, while the other presents that of ethico-intellectualistic (or spiritualistic) religion, greatly influenced by Buddhism and Confucianism.

*Nature Religion.*—In Shintō as a lower nature religion we find nature worship, fetishism, spiritism, totemism and primitive monotheism. The primitive Japanese worshipped the sun, the moon, the rainstorm, thunder, wind and fire; earth, the sea, the mountain, the deity of the earthquake, volcanoes, wells, hot springs and stones or rocks; the serpent, the tiger, the wolf, the wild boar, the hare, even the silkworm and the louse, trees, herbs and cereals.

*Anthropolatry.*—Individual personages are also worshipped as *Kami* or deities in their life-time as well as after their death, and we have Shintō shrines dedicated to special divine personages while living. The emperor is regarded as a "Visible Deity" (*Arahitogami* or *Akitsukami*), and some brave warriors or mighty heroes are also deities in human form. Later on the Ryōbu or Dual Shintō made good use of this form of religious syncretism. There are quite a number of examples of necrolatry and ancestor worship in Shintō. The sacred imperial regalia (or heirlooms), consisting of the mirror, sword and jewels, had originally a fetishistic virtue.

*Litholatry, etc.*—Particularly in Japan sacred stones are regarded as fetishes (litholatry). Different phallic emblems of stone or wood, both male and female in shape, are not very uncommon (phallicism). There is some evidence of totemism in primitive Shintō; e.g., Kamo-Taketsunumi-no-Mikoto, the remote ancestor of the Shintō priests of the Kamo Shrine in Kyōto, was once believed to be a large divine crow, afterwards worshipped at a separate shrine. The father of the Emperor Jimmu was traditionally recorded to have sprung from the crocodile or dragon Sea-Goddess Toyotama-Hime, the consort of Hikohohodemi-no-Mikoto.

There is something like a primitive monotheism in Ame-no-Minakanushi-no-Kami, or the Divine Lord of the Very Centre of Heaven, amalgamated with another supreme deity, Kunitokotachi-no-Kami, in later Shintō.

*Mythology.*—Primitive Shintō appears as a higher nature religion in the heavenly drama of the rich mythology of the *Kojiki* (*Records of Ancient Matters*), the *Nihongi* (*Chronicles of Japan*) and the *Kogoshui* (*Gleanings from Ancient Stories*). Here we find the divine parents Izanagi or the Progenitor and Izanami or the Progenitress, who procreated or begat numberless deities, natural objects and the land of Japan itself. Amaterasu-Ōmikami, the Ancestral Sun-Goddess of the imperial family, the Moon-God Tsukuyomi-no-Mikoto, and the divine brother Susano-O-no-Kami were born of the divine parents. The Solar Goddess reigned alone in the Plain of High Heaven. A conflict between the sun and the rainstorm was graphically delineated in Japanese mythology as a momentous event in the Divine Age. Then a divine council was held to entreat the Sun-Goddess to restore peace and order to the world and to reilluminate it by emerging from the heavenly rock-cave in which she had taken refuge from the violence committed by the impetuous brother Susano-O-no-Kami. Then follows the banishment of the divine culprit Susano-O from heaven to earth. He descended to the province of Izumo, took to wife a daughter of certain local deities, and got by her the famous Ōkuninushi-no-Kami, the Grand Divine Lord of the Locality, who afterwards ceded his whole dominion to the legitimate sovereign Ninigi-no-Mikoto, the Heavenly Grandson of the Sun-Goddess, of whom the Emperor Jimmu was a descendant.

*Emperor Worship.*—Thus according to tradition, half mythical, half historical, the Japanese imperial lineage has continued unbroken from the Ancestral Sun-Goddess to the present Emperor, who, like his predecessors, enjoys a divine right to the throne, representing in himself both Caesar and Pope—as a divinity in humanity. Even nowadays, in the hierarchy of his theocratic as well as constitutional government, he is often phrased "saisei-itchi," or the complete unity of political governance and religious observances. Thus Shintō as a national or state religion culminates in the form of emperor worship, not only in its naturalistic but also in its ethico-intellectualistic stage. Therefore Japanese patriotism or loyalty has been suffused with religious zeal. Herein lies one of the peculiar characteristics of the life or essence of Shintō.

As to the course of development of Shintō in its cultural stage, it is polydemonistic (animistic) at the beginning, then polytheistic, and at last pantheistic, with a tinge of monotheism. So, Izawa-Nagahide, a savant of the 18th century, says: "The 'eight hundred myriads of deities' are nothing but a different manifestation of one and the same deity Kunitokotachi-no-Kami (the Eternal Divine Being of the Earth), the Great Unity of

all things in the universe, the Primordial Essence of Heaven and Earth, eternally existing from the beginning to the end ("Amenonuboko-no-Ki"). Senge-Takazumi of the 19th century, a high priest of the Grand Shintō shrine of Izumo, also says: "There is no place in heaven and earth, either in the vast expanse of oceans or in the wild mountains, where we do not feel the omnipresence of the Deity." Again, "Even in the leaf of a tree or in a blade of grass the awe-inspiring Divine manifests Itself," says Urabe-no-Kanekuni.

Such a naturalistic pantheism of Shintō is deepened and ennobled by a further idealistic or spiritualistic grasp of the Shintō-Deity. Hayashi-Razan, an eminent scholar of Chinese classics of the 17th century, says: "The Deity is the Spirit of Heaven and Earth. The human mind partaking of divinity is an abode of the Deity, which is the Spiritual Essence. There exists no highest deity Ame-no-Minakan-ushi-no-Kami outside the human mind." (*Shintō-Denju*). The writer of the *Nijū-Issha-no-Ki* (*Records of the Twenty-One Shrines*) says: "A righteous man, pure in mind and just in conduct, is himself a deity, so we understand 'a manifest deity'—mentioned in the Imperial Edicts—in the person of the Emperor, in this ethical sense of the words." Ethico-intellectualistic or spiritualistic Shintō emphasises "inner purity," and not physical purity only. An oracle of the God Hachiman says: "I am none but Benevolence Itself. Moreover Sincerity is my Divine Body" (Urabe-no-Kanena, *Jingishōjū*). Thus Sincerity or Truthfulness, like the principle of Love in Christianity or that of Universal Benevolence in Buddhism, becomes the fundamental principle of the Shintō religion in the cultural stage of its development. Since as an ethical religion Shintō teaches us to worship the Deity *in spirit* and *in truth*, images or shrines can be entirely dispensed with. They are of little use, because the conception of the Deity is too lofty and too spiritual to enshrine it as an image in an abode built by mortal hands. So declares the Japanese savant Ise-Teijō (*Gunshin-Mondō*) of the 18th century, with Shima-Shigeoyu, a Shintō priest of the Grand Shrine of Izumo; while the author of the *Shintō-Gobusho* or *Shintō-Pentateuch* teaches: "What pleases the Deity is virtue and sincerity, and not the various kinds of material offerings," even as the Israelite prophet Hosea preaches, "Not sacrifice but mercy."

**BIBLIOGRAPHY.**—G. F. Moore, *History of Religions*, vol. 1 (1922); W. G. Aston, *Encyclopaedia of Religion and Ethics*, Art *Shintoism* (1920). (G. KA.)

**SHIPBUILDING** (see 24.922).—A survey of the progress of mercantile shipbuilding during the years 1910–25 covers a period of unprecedented fluctuation in the number and tonnage of vessels constructed, associated with continued progress in the design of ships and improved methods in their construction.

For many years prior to 1914 there was a steady increase in the total mercantile tonnage of the world corresponding to the ever-increasing volume of overseas trade, and although the distribution of this tonnage among the maritime nations varied from time to time, the total bore a definite relation to the expanding demand for overseas transport, both of passengers and of cargo.

**Effects of War.**—The War caused a practical cessation of shipbuilding in some of the countries involved, and a reduction in others which, combined with the loss of ships due to War perils, involved an actual reduction of vessels afloat after the first year of the conflict. At the same time there was an enormously increased demand for shipping for the transport of troops, munitions and general supplies, while the War casualties rose very rapidly. It thus became imperative that the output of new vessels should be expedited, and the various countries engaged in the conflict devoted themselves, as far as possible, to the replacement of lost tonnage, and the facilities for shipbuilding were, wherever possible, expanded to cope with the requirements for more ships. The efforts thus made, extensive as they would have been in normal circumstances, were hopelessly inadequate to meet the situation, and only by the vast expansion of the shipbuilding industry in the United States was the situation met.

**Expansion in U.S.A.**—Although shipbuilding has always been carried on in the United States it never developed there into a leading industry. No country in the world, however, offered the same possibilities of increased production, and the energy and initiative of the Americans, particularly after the entry of their country into the War, created an expansion in the shipbuilding industry which would have been deemed incredible a few years before.

The vast steel industry of America, together with its enormous structural engineering works, was harnessed to the task; new shipyards sprung up almost overnight and an organisation was created for the production of ships on that gigantic scale which is characteristic of the country. The results of that effort are clearly indicated in the following tables, showing the tonnage owned in the various countries at the end of June 1910, 1914 and 1925, the improved position in this respect of the United States being entirely due to the enormous programme of new construction undertaken during the later years of the War.

**Peace Conditions.**—With the advent of peace there was a return to more normal conditions, and the output of new tonnage naturally fell off considerably, with the result that the relative positions as regards shipbuilding became nearly the same as before (see Table II.). There has been great expansion in the tonnage of vessels devoted entirely to the carriage of goods in bulk, and in particular the transportation of oil has grown enormously with the increased use of that commodity. In 1914, oil tankers accounted for a gross tonnage of about 1,500,000, a figure which has increased in 1925 to no less than 5,500,000.

**Experimental Research.**—The steady advance in technical knowledge in all branches of science has led to the devotion of much research on the questions relating to the resistance of ships and the determination of the power necessary to propel a ship at a desired speed. There is as yet no mathematical solution to such problems, which can only be investigated experimentally. A marked step was taken in 1912 by the foundation of the William Froude experimental tank at the National Physical Laboratory at Teddington by the generosity of Sir Alfred Yarrow. A number of such institutions were already in existence but were all under either official or private control, while the new tank was founded for the purpose of carrying out investigations for the benefit of the shipbuilding industry generally. Much valuable work has been carried out by the staff of the tank, and the results published for general discussion have led to considerable improvements in the form of ships and the design of propellers. Much has been accomplished, but there is still a vast field to be explored before it will be possible to formulate the relation connecting the most economical form of ship with horse-power of the machinery, speed and carrying capacity.

**Design.**—Improvement of design has been steady and continuous, if without any outstanding features. For many years there had been a continuous increase in the safety of life at sea, particularly on passenger vessels. The sinking of the "Titanic" in April 1912 with 1,500 passengers and crew, led to the immediate appointment by the Board of Trade of a committee to advise the board as to what would constitute efficient subdivision of a vessel, due regard being paid to the nature of the intended service of the ship. This question had been under discussion for some time prior to the loss of the "Titanic," but that disaster naturally focused considerable attention on the recommendations made by what is generally referred to as the 1912–5 Bulkhead Committee.

**Safety Problems.**—In addition to the task delegated to this committee, a meeting was convened in London in Nov. 1913, to consider the problem of securing greater safety at sea. All maritime nations were represented on this body; known as the International Convention for the Safety of Life at Sea, which prepared a series of valuable recommendations covering not only the construction of passenger-carrying ships but also many points relating to safety of navigation, wireless telegraphy and life-saving appliances. The convention was signed by all nations represented, but the recommendations have not yet been made fully operative, owing to the effect of the War.

The Bulkhead Committee issued in 1915 a report containing regulations for the more efficient subdivision of merchant ships, which regulations were subsequently found to apply with undue severity to that type of ship which is dependent for its existence on the carriage of both passengers and cargo, as distinct from the purely passenger trade, such as arises in the North Atlantic trade. The regulations were consequently amended and, as now drafted, meet with general approval. On broad lines the object aimed at is to space the bulkheads so that the vessel will remain afloat with either one, two or three compartments open to the sea, depending on the size of the vessel and number of lives on board. Much experience of this nature was gained during the War, and ships built in accordance with the new regulations should be safe, except in the case of accident involving very extensive damage.

**Load Line Regulations.**—Of considerable interest to the shipping community was the appointment by the Board of Trade, in 1913, of a committee to report on the working of the regulations relating to the load line of ships and as to the alterations desirable to make the rules more suitable for international usage. The compulsory marking of a load line on a ship's side only became operative in Great Britain in 1890 and was followed by similar regulations in many other countries, although even to-day there is no load line law in so important a maritime country as the United States. The Load Line Committee suggested modifications of the existing rules, which removed largely the existing anomalies, but their most important proposal was a standard relation between strength of structure and draught of water. Although no legal action has yet been taken by the Board of Trade, the principal classification societies have revised their rules to bring them into accord with new standard of strength.

Probably one of the outstanding features in connection with

the subjects just referred to is the growing consciousness that the interests of the shipping community of the world are best served by the formulation of regulations for universal application, so as to afford equality of opportunity to any and every interest and country.

**Construction.**—Systematic investigation of the functions of the various parts of a ship's structure, and of the most economical methods of meeting the stresses developed has led to the elimination from the structure of many members which were, at one time, considered indispensable. Among changes of this kind are to be recorded the disappearance of web frames and the abolition of the large side stringers which formed so prominent a feature of the steel structure.

The whole trend in construction has been to simplify the various parts of the vessel by redistributing the material, concentrating on the more important parts of the main structure, the remainder being treated largely on the basis of local considerations. A widely spread practice has arisen reducing the number of the frames by an increase of spacing, the maximum spacing of 36 in. being very common, and the scantlings are otherwise increased to provide equivalent strength. In the double bottom, the closely spaced solid floors have been partially replaced by floors formed of bulb angle frames and reversed frames, while the number of fore and aft girders has also been reduced. The method of supporting the deck by strong girders which, in turn, are supported by large pillars at wide intervals is now almost universally adopted. Greater attention has also been paid to questions of strengthening against local damage, particularly at the forward end to provide against pounding and driving in a seaway. The improved distribution of material has permitted a reduction in the total weight of some 5 to 10 % less than was formerly considered necessary—and this without sacrifice of strength.

FIG. 1.—Internal view of an oil tank steamer built on the Isherwood principle.

FIG. 1. S.S. "British Aviator," latest type of oil tank steamer. FIG. 2. M.V. "Asturias," largest and most powerful motor liner completed and in service. Fitted with two sets of 8-cyl. double-acting Diesel engines, developing 20,000 H.P.  
(Courtesy of—Fig. 1, Anglo-Persian Oil Co. Fig. 2, Royal Mail Steam Packet Co.)

The outstanding feature in construction has been the system initiated by Sir Joseph Isherwood. In the usual method of construction, the frames and beams supporting the shell and deck plating are arranged transversely, but in the Isherwood system the frames run longitudinally, and thus support the plating in the direction of greatest stress with increased efficiency. Fig. 1 shows clearly the principal features of the design as applied to an oil tanker.

This system, as applied to oil tank vessels, effected a saving in the weight of material in the earlier ships of this type over the transverse framing previously adopted of about 12%. This large saving naturally led to improvements with the transversely framed oil vessel and the difference in weight between the two systems was reduced, although it still remains appreciable. The number of vessels built on the longitudinal system increased rapidly, and to-day practically all new oil tankers are of this type. The number of longitudinally framed vessels built in the last 15 years is nearly 1,500 with a carrying capacity of 12,500,000 tons, of which 700, with a total capacity of 6,500,000 tons deadweight, are ships carrying oil in bulk. The great success of the longitudinal system has encouraged the introduction of designs in which the framing at the bottom and deck is longitudinal, while ordinary transverse framing is retained on the ship's side. A number of ships on this combination system have been built and have, so far, proved satisfactory.

TABLE I. *Gross Tonnage of Merchant Vessels Owned in Various Countries on June 30 of Each Year*

| Country                   | 1910       |          | 1914       |          | 1925       |          |
|---------------------------|------------|----------|------------|----------|------------|----------|
|                           | Tonnage    | Per cent | Tonnage    | Per cent | Tonnage    | Per cent |
| Great Britain and Ireland | 17,516,479 | 41.8     | 19,256,766 | 39.2     | 19,440,711 | 30.1     |
| British Dominions         | 1,495,815  | 3.6      | 1,788,283  | 3.6      | 2,781,487  | 4.3      |

| Spain                     | 3,234     | .2       | 52,609       | .7       | 3,859     | .2       |
| Sweden                    | 8,904     | .5       | 50,971       | .7       | 31,211    | 1.4      |
| U.S.A. (Sea)              | 177,601   | 9.1      | 3,579,826    | 50.1     | 90,155    | 4.0      |
| U.S.A. (Lakes)            | 153,717   | 7.9      | 495,559      | 6.9      | 49,308    | 2.2      |
| Other Countries           | 31,567    | 1.6      | 26,755       | .4       | 25,670    | 1.1      |
| World                     | 1,957,853 | 100.0    | 7,144,549    | 100.0    | 2,247,751 | 100.0    |

**Materials.**—It would almost appear that the limit of economy arising from distribution of material has now been reached, and that any further saving can only be attained by the employment of a quality of material superior to that now in use. Progress has already been made in this direction by the introduction of a new type of steel which can experience a stress of 15 tons per sq. in. without any permanent deformation, as compared with a much lower figure for ordinary mild steel. Vessels have been built of this material which show a saving in weight of steel of about 10% and should prove quite satisfactory, although the limited experience available does not yet permit of any definite conclusion. (W. S. A.)

**SHIPPING** (see 24.083).—The movement of overseas commerce dominates the building and running of trading ships, and to understand the shipping problems created by the World War, the nature, volume and distribution of overseas commerce of the world before, during and after the War must be realised. Although trade is based on individual needs, and those needs must be satisfied by individual enterprise, it can be measured by the total volume passing between the countries, and for a period of stable exchange and comparatively steady prices, values can be taken as a measure of fluctuations in volume.

It has been estimated<sup>1</sup> that in the 10 years preceding 1914 the total international trade of the world increased in value from £5,000 million to £8,000 million, and that 80% of such trade was seaborne. Of this trade the share of the United Kingdom in 1913 was £1,400 million, and for that year the volume of her exports was estimated at 94,000,000 tons, and of imports was estimated at 56,000,000 tons, giving a total of 150,000,000 tons weight. If the volume of British overseas trade be taken as typical of that of the world, and there are reasonable grounds for such an assumption, then the volume of the seaborne trade of the world in 1913 represented about 700,000,000 tons weight. On this basis of comparison the same cargoes appear as both exports and imports, and therefore the weight carried was about 350,000,000 tons.

For the carrying of this seaborne trade, steam tonnage under all flags had in the same 10 years increased from 17,000,000 to 25,000,000 tons net register.

In the table on p. 532 the size of the ships is given in tons net register, the method commonly adopted in official returns, as it is upon such tonnage that port and other dues are generally levied throughout the world. In Lloyd's Register, the size of ships is given in gross tons register, whilst in other returns used by the shipping industry sometimes gross tonnage and sometimes dead weight carrying capacity is used. For general purpose the relation between these different methods of measurement may be taken, roughly, as 100 tons net register = 164 tons gross measurement or 250 tons dead weight carrying capacity. But no method of measurement represents the cargo-carrying capacity of the ship during a given period, as such capacity is dependent on the number of voyages made. It follows, therefore, that an estimate of the yearly cargo-carrying capacity of the shipping of the world is a matter of difficulty, but it is indicated very roughly by the recorded entrances and clearances of the ships under all flags in the ports of the world. These records are not complete, and they are not in all instances strictly comparable, but to some extent they can be tested by the records of the shipping passing through the Suez and Panama canals and by figures issued by the various authorities that control the shipping of the world.

As overseas trade developed, the energies of commercial enterprises were devoted to perfecting transit facilities. Ports and facilities for distribution from them were built and added to, to meet the requirements of the areas they could best serve. The energies of commercial enterprise were directed on maintaining a steady flow of traffic through the ports, and minimising the distances over which land distribution must be made.

<sup>1</sup> Parliamentary Papers Cd. 8128, 7786, 7525, summarised in Report of Committee of Chamber of Shipping of the United Kingdom and Liverpool Steam Ship Owners Association, July 1917, vol. ii., p. 76.

## SHIPPING

The following table gives the steam tonnage owned by each country in 1904, 1913, 1920 and 1925:—

| Countries                             | Tons, Net Register |            |            |            | Percentage of Total |        |        |        |
|---------------------------------------|--------------------|------------|------------|------------|---------------------|--------|--------|--------|
|                                       | 1904               | 1913       | 1920       | 1925       | 1904                | 1913   | 1920   | 1925   |
| United Kingdom                        | 8,751,853          | 11,109,560 | 11,043,079 | 11,771,138 | 52.03               | 44.81  | 35.09  | 32.25  |
| British Dominions and Possessions     | 674,620            | 915,950    | 1,135,199  | 1,429,757  | 4.01                | 3.69   | 3.60   | 3.92   |
| British Empire Total                  | 9,426,473          | 12,025,510 | 12,178,278 | 13,200,895 | 56.04               | 48.50  | 38.69  | 36.17  |
| Russia including Finland              | 444,555            | 462,022    | 360,890    | 269,968    | 2.64                | 1.87   | 1.15   | 0.74   |
| Norway                                | 642,657            | 1,122,577  | 1,207,049  | 1,596,613  | 3.82                | 4.53   | 3.84   | 4.38   |
| Sweden                                | 408,124            | 551,964    | 607,575    | 764,573    | 2.43                | 2.23   | 1.93   | 2.09   |

<sup>1</sup> Includes vessels engaged in trade between the Atlantic and Pacific Coasts of the United States, which, as "coasting trade," is reserved exclusively for ships under the United States flag.

## EFFECT OF THE WORLD WAR

It is difficult to estimate the direct effect of the War on the volume of international trade, and on the ship-carrying power under all flags. On the declaration of War the great bulk of the overseas trade of Russia, Belgium, Germany and Austria-Hungary ceased, and their merchant fleets disappeared from the high seas. Their trades together represented about 23 % of the total international trade of the world, and their shipping about 16 % of the ship-carrying power. The international trade of the British Empire represented about 20 % and of France about 7 % of the total, and their shipping 52 % and 4 % of the ship-carrying power.

The international trade of the non-belligerent countries represented the remaining 41 % and their shipping the remaining 28 % of the ship-carrying power. The international trade of these countries was seriously restricted by the War cutting off the sources from which they had obtained the greater part of their imports of manufactured goods, and the markets in which they had sold a considerable part of their exports of food supplies and raw material, and by the general curtailment of international credit, without which overseas trade became difficult, if not impossible. But the whole of their ship-carrying power remained available, while about one-fifth of that of the British Empire and France had to be given up to direct War services.

No records had been published by the end of 1925 upon which the volume of the international trade of the world during War years could be calculated, but it would appear probable that its decrease was greater than the decrease in the shipping available, even after deduction of shipping directly given up for War service. But another factor of the first importance had also to be taken into account; for as the War proceeded it became apparent that the carrying power of the ships had been seriously diminished—that is, the number of cargoes that each individual ship could deliver within a given period of time had materially decreased. Not only had more time to be spent on the actual voyage, in the avoidance of War perils and in serving more distant ports, but the ports, and the railway communications with those ports, were frequently being overwhelmed with War or other unaccustomed traffic. This general slowing down in operations was the principal adverse factor affecting ship-carrying power throughout the War. The result was that the ship-carrying power available was insufficient to meet demands, and in consequence freights advanced all over the world, and, what was of far greater moment, the volume of supplies delivered fell short of the world's requirements and thereby prices were forced up by actual shortage. The position could be met by decreasing the demand for ship carrying, or by speeding up the "turn round" of the ships in port.

*Great Britain.*—Speeding up in the ports of Great Britain became more and more impossible as the control of the State over the ships and the cargoes they carried increased, notwithstanding the efforts of the Ministry of Shipping. The demand could be lessened in one of two ways: by advancing the freights, or by placing restrictions on the volume of the cargoes carried. Each method involved a selection amongst the cargoes offering, and both were open to objection. If the first were followed, then although ability and readiness to pay the increased freights were evidence of the pressing character of the demand for certain kinds of commodities, they were not necessarily evidence of a real national need for those commodities. The second method involved the rationing of the consumers, and that could only be done by the State. The shipowners had neither the knowledge nor the authority to make the selection; and Governments shrank from assuming responsibility. Up to the end of 1916 the Government relied in the main on the first method, but it endeavoured more and more to combine it with the alternate and inconsistent policy of fixing the freights at which particular classes of imports were to be carried.

From the beginning of 1917, the Government assumed full control over all the ships under the British flag; it determined the voyages to be made, fixed the freights charged, and rationed the nation. As the freights fixed were substantially below the rates ruling in the open freight market of the world, no attraction was

offered to ships under foreign flags, which therefore transferred their carrying power to trade with other countries in which they could earn far higher freights with less risk. The result was that the ship-carrying power available was reduced, while the organisation set up to deal with the imports carried at fixed freights, and still more those set up under the rationing policy, intensified the congestions in the ports.

In 1914 Great Britain had about 3,600 steamships, representing some 10,000,000 tons net register, employed in ocean overseas trades. Of these 1,698, representing 4,300,000 tons net register, were lost through war perils, two-thirds of those losses occurring after Jan. 1917. By that time the War demands on the shipbuilding yards and engineering shops were so heavy that replacement was impossible. To meet this loss, and that of the ships under foreign flags driven away by the fixing of freights, ships under the British flag were withdrawn from Eastern and other trades, and concentrated on the shortest routes over which the country could obtain, on credit and not as a commercial operation, its overseas supplies: and in consequence the ports serving the North American route were still further congested.

*Allies and Neutrals.*—The Allies and the non-belligerent countries did not attempt to fix freights generally on voyages to and from their ports. They suffered heavily from the loss of ships and the slowing down of overseas transport, but they had not sufficient shipping under their own flags to tempt them to run the risk of driving from their trades ships under other flags by refusing to pay current rates of freight. The Allies made enormous demands on British ships to carry War material and national supplies, with the result that, while neither the Allies nor the non-belligerent countries suffered towards the end of the War as heavily as Great Britain from the lack of ship-carrying power, they suffered almost as heavily from the closing of markets, in which they had been accustomed to trade as both sellers and buyers. They were unable to find new sources of manufactured goods, which resulted in the development of home industries in all countries, and a general decrease in international trade all over the world.

The War, and in particular the policy followed by the British Govt. in regard to British merchant shipping, caused nations to attach an exaggerated importance to the ownership under their own flags of ship-carrying power, and ships were built without any regard to the economic forces controlling shipping. The diagram on p. 534 shows the tonnage launched by the principal nations of the world.

Although therefore it is difficult to estimate the direct effect of the War on the volume of international trade and on the ship-carrying power under all flags, it is clear that it was enormous. So far as Great Britain and the Central Powers were concerned, it disorganised almost every trade in which they had been engaged, some of which were entirely destroyed. New competitors arose amongst both sellers and buyers, the United States and Japan, in particular, greatly increasing their trade, and ship-carrying power far in excess of the world's requirements was brought into existence.

## SHIPPING AFTER THE WAR

*Great Britain.*—In March 1916 the shipping industry appointed a committee to advise as to the measures requisite for the maintenance, after the War, of a mercantile marine adequate to the Empire interests in peace, as well as its needs in war. In their report, made in July 1917, this committee said:—

Experience during the War, of the State as a manufacturer, a merchant and a shipowner, has demonstrated the impossibility of Government controlled business ever holding its own in international commerce. The ruling principle of our trade policy after the War should therefore consist in the maintenance for each individual citizen, be he producer or consumer, manufacturer, trader, banker, underwriter, shipowner, employer or workman, of the fullest possible opportunities for the exercise of his energies and enterprise in the markets of the world, subject only to such restrictions as must be imposed in the interest of national safety.

This policy is now generally accepted in principle; but it took years for the nation to realise that any other policy must result

FIG. 1.—Graphs showing tonnage launched each year from 1913 to 1925 in the principal shipbuilding countries. Only vessels of 100 tons gross and upwards are included in the figures, taken from the League of Nations Monthly Bulletin of Statistics, upon which the chart is based. The United States coast and Great Lakes tonnage launched are given separately. The Canadian tonnage launched on the Great Lakes is included in the graph of the British Empire.

in disaster, and indeed it is open to doubt whether that fact was fully recognised by 1926. The Governments of the day would not face the position. No doubt the transition from war to peace conditions was full of difficulties, and even dangers, and it was in the hope of mitigating these dangers that department control was continued throughout 1919 and a part of 1920.

The British shipping industry by the end of 1920 had replaced its War losses of 4,000,000 tons net register, but at the cost of from two and a half to three times that of the ships replaced, and of nearly double the amount it had received from the War risk insurances on such ships. The profits of the industry during the War had been kept down not only by the taxation of all excess profits, but also by the imposition of exceptional conditions of employment at rates of freight calculated on a peace basis. In the result, the industry had neither the means nor the credit to do more than make good its War losses; but the tonnage built was sufficient to place again at the disposal of the country and of the world at large, by the end of 1920, at least as much ship-carrying power under the British flag as was in being before the War.

**Other Countries.**—In other countries not only were the War losses replaced, but the shipping under their flags was greatly added to, in part out of the unrestricted profits earned by their shipowners during the War, and in part out of national funds. But in those countries the cost of building was also far in excess of the value of the ships based on their future earning power, and much of the tonnage built could never meet the needs of international trade. By reason of the building under other flags, when the War ended the steam tonnage of the world

in existence, notwithstanding all the War losses, was in excess of that which had been available at the opening of the War, and by the end of 1920 it exceeded 31,000,000 tons net register, of which Great Britain owned 11,000,000 tons net register.

By the end of 1920, the replacement of the British ships and the complete withdrawal of all state control provided efficient tonnage far in excess of the world's demand for oversea carrying power. Freights accordingly fell by upwards of 60% and went on falling, and ships began to be laid up, as the earnings were insufficient to cover the cost of running. The following table shows the laid-up tonnage of the principal maritime countries on Jan. 1 of 1922, 1923, 1924 and 1925:—

|                     | Jan. 1<br>1922 | Jan. 1<br>1923 | Jan. 1<br>1924 | Jan. 1<br>1925 |
|---------------------|----------------|----------------|----------------|----------------|
| Net Tons            | Net Tons       | Net Tons       | Net Tons       |                |
| United States       | 3,237,000      | 3,249,000      | 2,604,000      | 2,575,000      |
| United Kingdom      | 1,079,000      | 616,000        | 554,000        | 430,000        |
| France              | 662,000        | 445,000        | 274,000        | 190,000        |
| Italy               | 357,000        | 288,000        | 200,000        | 137,000        |
| Netherlands         | 199,000        | 201,000        | 143,000        | 40,000         |
| Norway              | 126,000        | 32,000         | 31,000         | 15,000         |
| Sweden              | 124,000        | 13,000         |                | 12,000         |
| Greece              | 104,000        | 46,000         | 74,000         | 15,000         |
| Japan               | 73,000         | 60,000         | 18,000         | 15,000         |
| Belgium             | 168,000        | 104,000        | 53,000         | 16,000         |
| Denmark             | 98,000         | 10,000         | 8,000          |                |

| Percentage          | 100            | 84             | 63             | 55             |

(N. H.)

**SHOOTING.**—A definite stage in the history of the sport of shooting was marked by the World War. In Scotland and Northern England during the years 1914–8 most of the grouse moors were not shot over, and the majority of the keepers were away at the front. This led, in some places, to over-stocking, which brought in its train disease; elsewhere there was a large increase in hooded crows, black-backed gulls and other enemies of game, which it took the keepers, on their return from the War, some time to reduce. Within two or three years, however, the course of the grouse-shooting seasons became normal, and, with an increased demand for moors, the rentals for shootings rose to figures considerably exceeding those obtained before the War.

But the chief change wrought by the War belonged not so much to Scotland as to estates in England. Before 1914, the sport of pheasant-shooting had, in the opinion of a good many people, assumed rather unnatural proportions. On some estates pheasants were hand-reared in such immense numbers that the principal days' covert-shooting ceased to possess the element of wildness and uncertainty that is the true charm of the sport. During the war, no pheasants were reared by hand, and in the years that immediately followed most of the birds which were shot were wild. Concurrently, a good deal more attention was turned to the best methods of managing partridge manors and increasing partridge stocks. With the gradual resettlement, however, the hand-rearing of pheasants began again, and the industry of the game farmers, producing a yearly supply of game eggs and birds for shooting estates, grew and thrived. The year 1926 saw more game farmers in existence and doing good business than any previous year, while the number of game and gamekeepers' licences taken out in England and Scotland increased from 62,873, with a revenue of £162,901 in 1910, to 70,178, with a revenue of £190,479 in 1924. (E. P.)

**United States.**—In the United States conditions in field shooting are vastly different from conditions in Europe. There are no grouse moors in the United States, there are not as many private shooting lodges, and but very few persons make a business of game breeding. Wild life has always been regarded as common property, free to be shot by anyone. Though hunters take, it is estimated, game worth about \$100,000,000 from the

fields annually, though vermin is credited with taking a toll 10% greater than the sportsman, and though the automobile and good roads have brought the game fields closer, there is more small game to be shot at now than a half century ago. In 1924 from the fields of six states that maintained records of what the hunters bagged, 12,058,512 pieces of game were taken. It is conservatively estimated that 25,000,000 rabbits, 20,000,000 quail, 15,000,000 squirrels, 15,000,000 ducks, 12,000,000 grouse, 10,000,000 geese and 100,000 deer are bagged yearly, as well as millions of other game animals.

The total number of hunters who took out licences in 1922 was 4,207,200. This number increased in 1923 to 4,490,707, in 1924 to 5,321,196 and in 1925 to 6,093,757. These individuals paid more than \$7,000,000 for hunting licences alone.

Millions of dollars are being spent by the various states to restock the fields. Game is increasing in all but five states, and Mississippi and North Carolina are the only states without game commissions. Pennsylvania estimates that the game within its borders is worth \$150,000,000. Since the beginning of the present century great efforts have been made to secure better and more uniform game laws, and this has caused a deeper interest in the conservation of wild life. There are more than 800 sanctuaries in the United States where game is being propagated and protected in addition to the United States forests where protection is given to more than 700,000 head of game. (P. P. C.)

**SHOREY, PAUL** (1857— ), American classical scholar, was born at Davenport, Ia., Aug. 3 1857. He graduated from Harvard University in 1878, and was admitted to the Chicago bar in 1880. He then continued his studies at the universities of Leipzig (1881) and Bonn (1882) and the American School of Classical Studies, Athens (1882-3), proceeding thence to the University of Munich (Ph.D., 1884). He was professor of Greek at Bryn Mawr College 1885-92, resigning to fill a similar chair at the University of Chicago. He became head of the classical department at Chicago in 1896, and was appointed by Columbia University Roosevelt professor in the University of Berlin (1913-4).

Shorey wrote *De Platonis Idearum Doctrina* (1884); *The Idea of Good in Plato's Republic* (1895); *The Odes and Epodes of Horace* (1898); *The Unity of Plato's Thought* (1903); and *The Assault on Humanism* (1917), the latter a brilliant but bitter polemic directed chiefly against those who minimised the value of humane studies in the educational system. He became managing editor of *Classical Philology* in 1898, and was a constant contributor to its columns.

**SHRAPNEL:** see AMMUNITION.

**SIAM** (see 25.2), an independent kingdom of southeastern Asia and a member of the League of Nations. Area 200,148 square miles. Population (estimated) 9,223,179.

## I. POLITICAL HISTORY

On King Chulalong Korn's death on Oct. 23 1910 he was succeeded by one of his sons who had been nominated in 1895 as heir-apparent. The latter was known during the first few years of his reign by his personal name of Vajiravudh, but in 1916 this sovereign issued a decree that "Ramadhipati" (King Rama) should be the dynastic title of his line, and that each previous monarch should be known as "King Rama," with the requisite numerical figure signifying the order of reigning. Thus he was known as Rama VI. until his death on Nov. 26 1925, when, having no male issue, he was succeeded by his younger brother, Prajadhipok, Prince of Sukhodaya.

During the 15 years of King Rama VI.'s reign, Siam's progress externally towards what may be termed treaty independence, and internally towards political and economic development, proceeded without interruption. Though arrangements with certain foreign Powers made in the years immediately preceding the World War contributed to the partial abolition of extraterritoriality, the complete disappearance at no distant date of the jurisdictional restrictions acquiesced in by Siam in the middle of the 19th century was ensured by treaties concluded after 1918.

The most important modern treaties are those made with the

United States (1920), Japan (1924), Denmark, France, Great Britain, Holland, Portugal and Spain (1925). In 1926 treaties were being negotiated with Belgium, Czechoslovakia, Italy, Norway, Sweden and other European nations. A provisional economic arrangement was made with Germany in 1925. The treaties have in common agreement on the part of the foreign Power to an increase in Siamese tariff rates, and to the subjection of its nationals to Siamese courts; though certain jurisdictional limitations will remain in effect until the publication of all the Siamese codes, viz.: the penal code, the codes of procedure, the law for the organisation of courts and the civil and commercial code, and for five years thereafter.

The eventual result will be the submission of all foreigners residing in Siam to Siamese law administered in Siamese courts by Siamese judges. As regards Siamese law and its development, it is interesting to note that, whilst urgent situations have been met by the issue of legislative measures in the form of royal decrees, Siam has already published and brought into effect several of the codes here mentioned, and three books of the civil and commercial code. This latter code represents many years' work on the part of a joint Siamese and French commission but awaits a satisfactory translation into Siamese for its final publication.

The Siamese declaration of war in July 1917 against Germany and Austria-Hungary had amongst other consequences the effect of automatically terminating the extraterritorial treaties with those Powers. All enemy subjects residing in Siam were interned, and a quantity of German shipping was seized and condemned as prize.

Much useful legislation has been enacted, and experimental municipalities have been set up in several of the larger provincial towns. Important indications of the awakening and development of the country are: the abolition of the gambling farms; the withdrawal of opium from public tender to government monopoly and progressive restriction of facilities for its use; the gradual extension of a national and, where conditions are suitable, compulsory system of education; a general application of free, compulsory vaccination; the royal encouragement of athletics, more particularly of football; the inauguration by Rama VI. of a now flourishing Boy Scout movement under the name of Wild Tiger Corps; a marked modernisation and expansion of the Siamese language induced by closer contact with the modern world; the introduction of the use of surnames, many thousands of which were devised and assigned by Rama VI.; the rise of a native journalism and press, not devoid of some boldness in criticising high personalities or official laxities. On Sept. 28 1917 a change was made in the national flag. Hitherto all Siamese flags had borne in some form or other the device of a white elephant; the symbol was retained for the royal flags and for military and naval services only. The national flag for general use now consists of a horizontal stripe of dark blue, flanked on either side by a narrower white horizontal band, and outside each of these by a red horizontal band.

## II. ECONOMIC AND FINANCIAL HISTORY

**Communications.**—In 1892 the construction of the first state railway was commenced, a project of 264 km. from Bangkok north-eastwards to Korat. In 1924-5 the length of state line open to traffic had advanced to 2,490 km.; 588 km. were under construction, and schemes involving over 3,000 km. further extension were under contemplation.

The northeastern line from Bangkok to Korat was in 1926 being extended by some 300 km. in a due easterly direction to Ubon near the French boundary on the Mekong river; at a point 90 km. from Bangkok a line diverges to Chiang Mai, the principal town of northern Siam, distant 750 km. from Bangkok. This line, on which through traffic to Chiang Mai was opened in Jan. 1921, passes in its northern section through picturesque mountains; and amongst its tunnels is one 1,354 metres in length. A sleeper service is available for the journey between Bangkok and Chiang Mai, which occupies 26 hours.

An eastern line from Bangkok runs 168 km. to M. Krabin, and was being extended to Aranya Prades on the Cambodian frontier, at which point it was due to arrive early in 1926. It is the ambition of the French colonial authorities to bring either their railway or their road touring system out to this frontier, and thereby render it

possible to travel entirely by rail or car between Singapore and Saigon by way of Bangkok.

These railways, all lying to the east of the Me Nam, were at first built standard gauge, but are being rapidly altered to the metre gauge adopted for the Siamese Southern Railway, which has its terminus on the west side of the river. The Southern Railway traverses the length of Siamese territory in the Malay Peninsula, and brings Bangkok in touch with the Straits Settlements. It connects with the Federated Malay States railway system at Padang Besar, on the Kedah-Pulih border for Penang, and another branch goes southeast to the border of Kelantan at Sungai Golok. The length of this railway is about 1,200 km.; construction began in 1908, and by 1918 through communication between Bangkok and Penang was established. The rolling stock now includes comfortable sleeping carriages, and the journey is timed for 36 hours. A large bridge begun in 1923 spanning the River Me Nam Chao Bhaya, on the northern outskirts of Bangkok, will enable the southern line trains to avoid the present terminus on the west bank of the Me Nam Chao Bhaya, and bring passengers direct to the central station in Bangkok.

The royal Siamese railway department is run with marked efficiency, and the annual return on the capital expended ranges from 3½% to 4½%, a remunerative state investment. Under this department there has also been organised a bureau of roads and highways, which hopes to develop a policy of road construction whereby highways will be brought into being as feeders to the railways at the more important trading centres.

There has been a steady and consistent improvement in postal, telegraphic and telephonic communication throughout the kingdom. Wireless installations are found at Bangkok, also at Singora, in the extreme south of Siamese territory and although these are under the control of the naval and military authorities their use under emergency may be granted to the public. Parcel post and money order services have been extended to many remote parts of the country, but the principal innovation in this respect is the adaptation of aviation to postal communication. Siam now possesses a very efficient aviation force; the chief aerodrome at Dorn Muang, 22 km. north of Bangkok, has become well known as an air station since aviators from Great Britain, France, Portugal, Holland, Italy, Argentine and U.S.A., attempting long flights, have made it a port of call. Many towns in the interior have prepared aeroplane landing places, and much valuable service is performed and useful experience is obtained by the aviation force in maintaining regular postal communication with remote provincial places.

**Production and Trade.**—The bulk of the trade of the country passes through the port of Bangkok: the addition of 10% or 15% to the Bangkok trade figures will give fairly accurate totals of the trade of the whole kingdom. Siam being an agricultural and non-manufacturing country, the amount and value of two or three natural products, e.g., rice and teak, give the measure of its productivity, as do the imports of its prosperity and purchasing power. The following figures show the steadily expanding volume of Siam's production and commerce:—

| Year Ending                            | Exports                          | Imports                          | Total                             |
|----------------------------------------|----------------------------------|----------------------------------|-----------------------------------|
| March 31 1911                          | Tcs. 108,907,821<br>=£8,324,074  | Tcs. 68,205,328<br>=£5,213,090   | Tcs. 177,113,149<br>=£13,537,164  |
| March 31 1921<br>Ex. 9.58<br>tcs. =£1  | Tcs. 66,138,000<br>=£6,903,760   | Tcs. 147,332,000<br>=£15,379,100 | Tcs. 213,470,000<br>=£122,282,860 |
| March 31 1925<br>Ex. 10.72<br>tcs. =£1 | Tcs. 165,931,496<br>=£15,478,675 | Tcs. 153,006,580<br>=£14,272,450 | Tcs. 318,938,076<br>=£29,751,125  |

In terms of currency the 1925 import figures are a record, the hitherto record year, 1920-1, being some 6,000,000 ticals below the 1925 figure. Of the 1925 import total nearly 67% or 102,000,000 ticals came from British ports: Hongkong 37,000,000, Great Britain 26,000,000, Singapore 22,000,000, India 14,000,000, other British possessions 2,000,000. These statistics do not, however, especially in the case of Hong Kong, necessarily indicate a British origin for the goods imported. The import item of highest value was cottons at 26,000,000 ticals, followed by provisions 14,000,000, iron and steel 11,000,000, cotton yarn 6,000,000, machinery 3,000,000.

The average import for five years ending March 1920 was tcs. 100,381,000. The average import for five years ending March 1925 was tcs. 140,806,800; 125,900,000 ticals, or nearly 76% of the total 1925 export figure, went to British ports, Hong Kong taking 61,500,000, Singapore 54,500,000, Great Britain 3,500,000, India 2,000,000 and other British possessions 4,000,000.

Of the total exports for 1924-5 rice of various grades represents in value no less than 134,876,000 ticals (£12,570,000), or in weight 18,727,000 piculs (1,114,700 tons); this was less than the previous year by 2,983,000 piculs (about 180,000 tons).

In explanation of the diminished value appearing under exports for the year ending March 1921, it should be stated that abnormal floods in 1917 had partially diminished the grain reserve of the country, and the two years prior to 1920 were years of scarcity in India.

Countries bordering on Siam sought to draw from her supplies which normally would have been obtainable elsewhere. The result was that rice, though seasonally abundant in Siam, went up to famine prices, and prohibition of export was of necessity imposed from July 1919 onwards, to preserve the food supplies of the country. After deducting the value of rice from the export total in the 1925 figures, only 31,000,000 ticals remain to represent all other exported Siamese products, of which sum teak is responsible for 6,500,000, re-exports 7,500,000 and "all other goods" 16,000,000. The teak forests are carefully conserved, so that on the whole there is little scope for the average annual output to vary.

In connection with rice production due account must be taken of the irrigation schemes which have been or are being carried out in the delta provinces of the country, whereby extensive areas of cultivable land, hitherto dependent upon the uncertainties of the annual rainfall, can count upon an assured supply of water. Upon the chief project, known as the South Prasak scheme, undertaken in 1913 and completed Nov. 1924, approximately £1,200,000 was expended, and it is calculated that an area of 240,000 ac. will benefit. Work is proceeding on what is known as the Suphan programme, the estimated cost of which is about £1,040,000.

**Finance.**—The revenue for 1908-9 amounted to 58,000,000 ticals or £4,300,000 at the then rate of exchange of about 13.30 ticals=£1. The actual budget figures for the financial year 1923-4 were: revenue, 88,417,733 ticals = £8,186,827 at exchange 10.80 ticals=£1, and expenditure, 91,053,133 ticals = £8,430,845. Revised estimates for the year 1924-5 place the revenue figures at 90,800,000 ticals and expenditure at 94,100,000. Though recent years have shown a budget deficit varying between 3,000,000 and 4,000,000 ticals, skilled attention is being paid to the questions of economy and finance generally, and when allowance is made for Siam's favourable annual trade balance it is reasonable to expect an early return to the former state of things when Siam almost invariably had a favourable balance at the end of her financial year. The currency position is a strong one. At the end of March 1925 the total net issue of notes was 100,968,727 ticals against the possible redemption of which Siam holds a foreign reserve of 56,000,000 ticals. There is also the gold standard reserve, the special object of which is to support the exchange value of the tical currency, amounting to £1,410,000, in addition to coin and bullion held in the currency reserve in Siam.

The country's indebtedness at the end of March 1926 was composed of a balance of £721,220 of the 1905 loan, a balance of £2,303,040 of the 1907 loan, a balance of £4,303,833 of the 1909 loan; £2,000,000 and £3,000,000 of the 1922 and 1924 loans, aggregating £12,328,093.

See the reports of the various departments published by the Siamese Govt. and obtainable through the Siamese Legation; *Statistical Year Book of the Kingdom of Siam* (annual 1916 onwards); *Siam* (British Foreign Office Handbook, 1920); *Siam Directory* (published by Siam Observer, annual); *Directory of Bangkok and Siam* (published by Bangkok Times, annual). (T. H. L.)

**SIBELIUS, JOHAN JULIUS** (1865— ), Finnish composer, known as Jean Sibelius, was born at Tavastehus on Dec. 8 1865. He studied music under Wegelius at Helsingfors 1885-9, under Becker 1889-90 in Berlin and under Fuchs and Goldmark in Vienna 1890-1. In 1893 he became a teacher of music at Helsingfors. The entry of Sibelius into the musical world marked the appearance of a national inspiration, combined with a strong personality and an accomplished technique. As his genius developed Sibelius became not only an unrivalled master in Scandinavia, but an outstanding personality among the composers of the world. The characteristics of his music are wide imagination and powers of expression, a masculine sentiment and a respect for his art which never allowed him to abuse his profound technical powers for the display of mere virtuosity. Among his compositions are: 10 symphonic poems, seven symphonies, a violin concerto, a string quartet, *Voces Intimae*, *Valse Triste*, several works for choir and orchestra, the music to *Pelleas and Melisande*, *As You Like It*, *The Tempest*, the pantomime, *Scaramouche*, numerous songs and miscellaneous pieces.

**SIBERIA** (see 25.10), the name usually applied to Russia-in-Asia, with the exception of those districts of Central Asia that are grouped under the name of Turkestan.

Siberia is divided into seven governments, three autonomous republics and the autonomous republic of Oiratsk; it covers an area of 2,809,227 sq. m., and has a population of 7,607,919, of whom 1,005,354 are classified as urban. The average density is just over 2.7 per sq. m., but the population is very unevenly distributed, the density being as high as nine in the Novo Nikolaevsk Govt. and only 0.5 in the Yenisei region; vast tracts in the north are almost entirely uninhabited. The principal towns are Omsk (143,380), Irkutsk (88,358) and Tomsk (89,877).

FIG. 1.—Map showing the present (1926) divisions of the vast territory usually known as Siberia.

The autonomous province of Oiratsk contains 77,529 inhabitants, all of whom are classified as rural. There are no towns, and the capital of the province is the village of Ulala. The former Far Eastern Province is divided into four governments; it covers an area of 804,140 sq. m., and has a population of 1,781,324, of whom 385,864 are classified as urban. The largest town is Vladivostok, with a population of 98,922. The average density is 2.28 persons per sq. m., though in Kamchatka the density is only 0.06.

**Political History.**—After the establishment of the Provisional Govt. in Leningrad (Petrograd) in March 1917 (see RUSSIA) Asiatic affairs first came to the fore with the establishment of an All-Russian Moslem Council in May, but no special measures were taken in regard to Siberia and the Far East. The Bolshevik revolution had also little repercussion there at first; a rising took place in Vladivostok in March 1918, which was liquidated by British and Japanese naval forces, who remained in effective control of the port till the following August. Meanwhile Semenov (himself a Buryat) had raised anti-Bolshevik forces east of Lake Baikal in February, but was forced to retire to the Manchurian frontier in May, following a Bolshevik rising in Trans-Baikal. In March a Czechoslovak force, drawn from the Austrian prisoners of war in Russia, was formed, and began a trek to Vladivostok, with the intention of fighting on the Western Front; they seized authority at many points of the railways to and in Siberia.

A provisional Socialist Govt. of Siberia was formed at Novo Nikolaevsk on June 3, and by the end of the month the Czechs were in effective control of the line of the Trans-Siberian railway from Omsk to Vladivostok. In July and Aug. Allied troops landed at Vladivostok with the intention of proceeding West to reconstitute the Eastern front against the Central Powers. By the beginning of Sept. the anti-Soviet forces had re-established communications along the whole Trans-Siberian Railway and had made some progress into Russia proper. On Sept. 24 a congress of all Russian and Siberian parties invested the government in a Directorate of Five at Omsk, but in the middle of

Nov. this directorate was overthrown and Admiral Kolchak appointed supreme ruler. In the spring of 1919 Kolchak's offensive reached its zenith, and by May he was in full retreat to Omsk. Inefficiency in command and administration and violent discontent in the rear prevented any further serious attempts at regaining lost territory. In Nov. the Soviet forces took Omsk, and in Dec. Tomsk, while by the middle of Jan. 1920 they had established their authority in Kamchatka. From this time on the area west of Lake Baikal became part of the R.S.F.S.R.

It was, however, more difficult for the Soviet Govt. to establish its authority farther east, and in May a Far Eastern Republic was formed. This Republic seems to have maintained close relations with Moscow, but was not Soviet in constitution and was more moderate in its administration and conduct of affairs. Semenov's bands continued to give trouble during 1920, but in Oct. he was driven out of Chita, which in the following month became the capital of the Far Eastern Republic, whose area was declared to be all Russian territory east of Lake Baikal. Elections for a constituent assembly took place in Jan. 1921, and it met at Chita on Feb. 12. Vladivostok had remained in a special position under Japanese occupation. The local Provisional Govt. was overthrown by Semenov and Kappel in May 1921, and a new Government established under Merkulov, which lasted till June 1922, when it was overthrown, only to be re-established within 10 days. It finally resigned in Aug., after a Zemstvo conference had elected General Dietrichs dictator of the maritime province. Shortly afterwards the Japanese troops began their evacuation, and on its completion at the end of Sept. Soviet forces entered the town. Soviet power was now consolidated over the Far East, and on Nov. 14 1922 the Constituent Assembly of the Far Eastern Republic declared its absorption into the R.S.F.S.R.

**Natural Resources.**—The immense potential resources of this area still remain almost entirely undeveloped. The area under grain cultivation in 1924 was 4,812,500 desyatins and the crop 232,200,000 poods, but much land suitable for cultivation is still untouched. Of

the estimated forest area of 313 million acres some 209 million have been surveyed but only a fraction of this area is under regular forest supervision; plans have, however, been drawn up to develop these areas. The output of the Kuznetsk coal basin has been raised from 27.2 million poods in 1913 to 62.2 million in 1923, and the coke works near Kolchugino are again supplying the steel works in the Urals. Gold production has been continued on a reduced scale, but in 1925 a concession to work their old properties was granted to the Lena gold-fields and production may be expected to increase.

**Communications.**—The Trans-Siberian railway is now functioning regularly, and the journey from Moscow to Vladivostok takes 11 days. Plans have been made to improve transport conditions, which remain the principal hindrance to the economic development of the country, but actually all that is being done is to endeavour to maintain existing services and to recondition the existing tracks. Investigations have been made and plans drawn up with a view to establishing a Trans-Siberian air service.

**Education.**—Educational facilities are being steadily developed, and there are now in Siberia six institutions of quasi-university standing, three at Omsk, two at Tomsk and one at Irkutsk; while in the Far Eastern Province there are two, one at Vladivostok and the other at Chita.

#### SIBERIA'S AUTONOMOUS REPUBLICS

**Yakutsk Autonomous Socialist Soviet Republic.**—This republic was established by a decree of the All-Russian Central Executive Committee on April 27 1922. Its territory lies to the west of the meridian of Irkutsk and to the north of the Trans-Siberian Railway, and comprises *inter alia* the whole basin of the Lena river. It is roughly triangular in shape; the western side marches with Siberia, the eastern with the Far Eastern Province, and the Arctic Ocean forms the northern boundary. The area of the republic is 1,457,068 sq. m. and the population is 266,504, of whom 11,242 are classified as urban. The capital is Yakutsk on the Lena (pop. 9,247). The climate suffers from great extremes of temperature; the June average is 15° C., the Jan. average -52° C.

**Mongol-Buryat A.S.S.R.**—This republic was established by a decree of Sept. 12 1923. It is a wedge of territory running up north from the Mongolian frontier of the U.S.S.R. and to the east to Lake Baikal. It comprises 152,768 sq. m., and is inhabited by Mongol Buryats, who were formerly nomads, but who are now settling down; cattle breeding is still the chief occupation. The population is 446,373 and the capital is Verkhneudinsk (pop. 22,500).

**Qirghiz A.S.S.R.**—This republic was established by a decree of Aug. 26 1920. It comprises the southwestern portion of Russian territory north of old Russian Turkestan and stretches from the Caspian to Mongolia, but lies south of the Trans-Siberian railway. It includes the autonomous provinces of Qara-Qalpak and Qara-Qirghiz, the latter (which was granted full autonomy at the end of 1924) comprising the eastern portion of what was formerly Russian Turkestan. The area of the republic is 860,161 sq. m. and the population is 4,945,753, of whom 431,588 are classified as urban. It is divided into nine governments, of which Semipalatinsk and Akmolinsk, each with over 1,000,000 inhabitants, are the largest. The capital is Orenburg (pop. 106,256), and the other important towns are Semipalatinsk (pop. 56,436), Petropavlovsk, the capital of Akmolinsk (pop. 35,884), and Ural'sk (pop. 32,208). The average density of the population is 5.6 per square mile. A test census carried out in 1920 revealed an increased population of about 4% compared with 1913; this republic was the only part of the territories now part of the Union of Socialist Soviet Republics to show an increased population in this census.

Qirghiz, the Republic, lies practically entirely in the Steppe region, and except near the Caspian, where the soil is arid, it is for the most part cultivable. Some of the population retain their nomadic customs and breed camels, horses and sheep, but the majority are settling down and taking to agriculture. The climate is very dry with a large range of temperature between extremes, vegetation is scanty and there are frequent salt lakes. In the north the soil is the black earth, and in 1924 the area under grain was 2,092,000 desyatins and the crop was 58,700,000 poods. The mineral deposits are considerable; copper, silver, lead, iron, coal and naphtha being found, but development is only just beginning and the output is irregular. Rock salt is mined near Ilets. Orenburg is a great cattle market, over 35,000 head of horned cattle and 30,000 sheep are slaughtered there annually.

**SICKERT, WALTER RICHARD** (1860— ), British painter, was born at Munich May 31 1860, the son of the painter, Oswald Adalbert Sickert, a contributor to *Fliegende Blätter*, and grandson of Johannes Sickert of Altona, painter and lithographer. Sickert studied under Whistler in Chelsea, but in 1885, following the advice of Degas, began to paint from drawings instead of from nature. His subject pictures include "Mamma mia po'areta" (1903), "Noctes Ambrosianae" (1906), "The Camden Town Murder" (1906), "Army and Navy" (1913), "Ennui" (1914), "Sinn Fein" (1915), "Pierrots on Brighton Beach at

Night" (1915), "Baccarat at Dieppe" (1920) and "Supper at the Casino" (1920). He also produced some architectural paintings, including "Hotel Royal, Dieppe" (1900), "Lansdowne Crescent" (1917) and "Pulteney Bridge" (1918). He became a member of the Société du Salon d'Automne, the Society of Twelve and the International Society, and a fellow of the Royal Society of Painters, Etchers and Engravers. As a teacher he exercised a strong influence over the younger British painters. He was elected A.R.A. in 1924, and exhibited characteristic etchings in 1925.

**SICKLES, DANIEL EDGAR** (1825-1914), American soldier and diplomatist (see 25.36), died in New York City May 3 1914.

**SIDGWICK, ARTHUR** (1840-1920), British scholar (see 25.39), died at Oxford Sept. 25 1920.

**SIEGECRAFT AND SIEGE WARFARE.**—The earlier article on fortification (see 10.679) deals with the history and development of siege and siegecraft, and summarises the views prevalent just before the World War of 1914-8. Changes due to the great economic and industrial developments of the latter half of the 19th and early 20th centuries were affecting, not only the design, but the rôle of permanent fortification. The conception of a fortress as a ring of defences protecting an important point, and capable of withstanding an investment unsupported by a field army, though by no means abandoned was being modified. The ring fortresses of the Napoleonic era, which protected important places such as capitals and arsenals and served as secure bases for field armies or refuges for beaten ones, were no longer capable of fulfilling their rôle. These changes were due to two main reasons. Firstly, the increased size of armies provided by universal service necessitated the employment of several lines of communication, wide bases and large areas for their concentration and deployment. Secondly, the greatly increased range and destructive power of artillery necessitated the extension of the perimeter to such a degree that for the defence of a fortress a field army was required. At the beginning of the War, therefore, zone fortification was beginning to be established in the highly organised industrial areas of western Europe. Reliance, however, was still placed in self-sufficing girdle fortresses, such as Paris, Antwerp and Belgrade, and in the less organised areas of Russian Poland.

**Use of Fortified Areas.**—Before examining the history and trend of opinion on permanent fortification during and since the War, it is advisable to consider the use and limitations of fortified areas. It is a principle of war that "victory can only be won as the result of offensive action," but a defensive attitude may at times be necessary or even advantageous. Fortresses can never win a victory; their use is to gain time and economise force.

1. To delay the enemy on important lines of advance, such as the barrier forts of the Alpine passes, or the fort of Manonvillers, which commanded the main line of railway from Strasbourg to Paris.
2. To protect vital points such as Paris and Antwerp.
3. To canalise the attack and force the enemy—unless he wishes to spend the time and men necessary for the deliberate attack of fortresses—to advance by certain specified lines. The Trouée de Charmes between Toul and Épinal is an example.
4. To act as a pivot of manoeuvre. It was for this purpose that the Germans used the Metz-Thionville zone.

#### I. FORTRESSES IN THE WORLD WAR

**Defences of Belgium.**—The fortresses of Belgium consisted of those covering the crossings of the Meuse at Liège and Namur and the entrenched camp of Antwerp. Liège and Namur—commenced in 1890, to close a probable line of advance between France and Germany—were officially described as "simple pivots de manoeuvre des places d'arrêt," while Antwerp formed a secure base for the field army and an ultimate refuge for the Government.

At the beginning of Aug. 1914 Liège with its 12 armoured forts, on a perimeter of 30 m. was defended by some 25,000 troops. Owing to the rapidity of the German attack little could be done to provide field defences for the intervals between the forts, and on Aug. 5 an attempt was made to capture the fortress by a "coup de main." This was repulsed, but the following

day a brigade of infantry penetrated the interval between two forts, and, reinforced by other troops, succeeded in gaining possession of the city, though none of the forts had fallen. Heavy artillery was then brought up, and on the 8th the first fort fell. By the 13th all the forts to the east and south had been rendered untenable, and by the 16th—eleven days after the opening attack and eight days after the first use of heavy howitzers—the remaining forts were compelled to surrender.

Namur, though somewhat smaller (having nine forts on a perimeter of 25 m.), also had a garrison of about 25,000 men. The Germans, profiting from their experience at Liège, waited until their heavy howitzers were in position. On Aug. 21 the bombardment commenced, and within 24 hours five out of the nine forts were reduced to ruins. By the 25th the remainder had been destroyed.

In both cases the rapid result had been brought about by the overwhelming power of the 12-in. and 17-in. howitzers, which the steel and concrete forts, only designed to withstand 8-in. shells, were powerless to resist. On the other hand, the few days gained were of incalculable value to the Allies. Antwerp, on which much money had been spent, had a perimeter of 60 miles. The Germans opened their attack with heavy howitzers against the southeastern section on Sept. 28, and three days later had

rendered four of the forts untenable. Meanwhile the Belgians, assisted by men of the Royal Naval Division, had entrenched a position on the line of the rivers Nethe and Rupel, some two miles in rear of the forts. Several attacks were made on these field defences, and it was not until Oct. 6 that the Germans were able to cross the Nethe. The city was now open to bombardment, and the majority of the defenders having been withdrawn across the Schelde the city surrendered on the 9th. Here again the armoured forts were unable to resist the fire of the heavy howitzers and fell in three days, while the hasty defences of the Nethe were able to hold out for six.

*Permanent Defences of Northeastern France.*—These were planned by General Seré de Rivière in 1874 in three main positions—the first close to the German frontier consisting of the linked fortresses of Verdun-Toul and Épinal-Belfort, with two premeditated gaps, one to the north, the Trouée de Stenay (20 m. wide), between Verdun and the forest of the Ardennes, and the other the Trouée de Charmes (30 m. wide) between Toul and Épinal. Behind these were the La Fère-Laon-Reims line, with the escarpment of Épernay-Nogent and the fortresses of Langres and Dijon to the south; and finally the defences of Paris itself. The northern frontier was protected by the neutrality of Belgium, but as this was one of the historic lines of invasion into the rich

industrial areas of Flanders and Artois it was considered that Lille, Valenciennes, Maubeuge and Mézières should be strengthened and their intervals covered by inundations and detached forts—Flines, Hirson, etc. In addition, certain barrier forts, as Longwy and Manonvillers, were reorganised or built. However, in 1912 it was decided not to maintain the fortresses of the second line La Fère-Laon-Reims or the detached forts on the Belgian frontier. Dijon and Langres were already third class, and Lille on April 3 1914 was declared open, only to be reclassified as a fortress on Aug. 21 and again declared an open town three days later.

The defences of the Verdun-Toul zone, which were the most modern on the French fortresses, were organised in depth with two or three lines of works in which the forts formed centres of resistance. With the exception of an occasional 75 mm. or 155 mm. gun in a steel cupola for direct fire, and "traditore" guns in Bourges casemates for the defence of the flanks, the artillery was situated outside and in rear of the forts. The forts themselves were generally small—Vaux was designed for a garrison of 150 men. They contained concreted underground galleries and casemates protected by masonry arches three ft. thick, with a three ft. cushion of sand between them and the main protective layer of eight ft. of concrete, and were enclosed by ditches 30 ft. wide and 20 ft. deep, which were in turn flanked by fire from concrete counterscarp casemates.

The existence of the fortified zone on the Franco-German frontier undoubtedly exerted a profound influence on the German plan of invasion. Moltke, in a memorandum written in 1912 on the subject of the violation of Belgian neutrality, which is quoted by Ludendorff, remarked that an advance through Belgium was likely to be more successful than an attack on the French fortified zone, which would degenerate into fortress warfare, cause great delay and lower the offensive spirit and initiative of the army. General von Kuhl, in *Der Marne Feldzug*, also states that "even the fortresses which were not attacked exercised a great influence on the operations. The existence of the line Verdun-Toul, Epinal-Belfort forced us to undertake the invasion of Belgium."

While the main German attack was from the north, preparations for a subsidiary advance through the Trouée de Charmes were made by the reduction of the barrier fort of Manonvillers. This concreted fort with its steel cupolas and casemates was reduced in two days to ruins by the fire of the heavy German howitzers. The main zones Verdun-Toul and Epinal-Belfort, however, though they formed pivots for the successful defence of the Trouée de Charmes, were not seriously threatened. Later, during the battle of the Marne, the centre of the Verdun-Toul line between the forts of Troyon and Liouville was violently attacked. Troyon, flanked by fire from Fort Genicourt, held but the Germans succeeded in capturing the fort Du Camp des Romains and secured a crossing over the Meuse at St. Mihiel. This gap, however, was too narrow to be of further use.

*Maubeuge.*—On the northern frontier the only French fortress subjected to siege was Maubeuge. With a garrison of 40,000 men of low category, with few guns, and with defences completely out of date as shown during Gen. Fournier's trial, the fortress held out for 11 days. This was largely due to the energy of the commander, who from the first day of mobilisation employed every available man on constructing a system of field defences and wire obstacles, providing communications and collecting supplies. On Aug. 25 the town was invested, and three days later the heavy artillery bombardment began. Energetic sorties by the garrison kept the besiegers at a distance and compelled them to reinforce their troops. By Sept. 5 the bombardment had rendered the defences on half the perimeter useless and the defenders began to be pressed back. Desperate fighting continued for the next two days and the town finally capitulated on the 7th. This delay was of the greatest value to the Allies. Strong German forces were absent from the Marne and the blocking of the important line of railway made the supply of Von Kluck's army a matter of great difficulty.

*Verdun.*—The comparatively rapid and shattering fall of the Belgian fortresses in 1914 caused a complete revulsion against

the use of permanent fortification. It was considered that under the fire of heavy modern artillery the demolition of fixed defences was a foregone conclusion. Instructions were therefore issued by the French command that reliance was to be placed on continuous zones of field defences, and that any permanent forts were to be incorporated in these zones, their permanent garrisons abolished, armament that would be of use in the field removed, and any elements remaining which might be of use to the enemy prepared for demolition. It was under these conditions that Verdun was attacked on Feb. 21 1916. The lines of trenches and field defences which had been established some 4 m. beyond the outer forts were thinly held. Under the cover of an intense bombardment by weapons of all calibres up to 17 in., the main attack was launched on the east bank of the Meuse. After four days' bitter fighting the line was pushed back about four m. and Fort Douaumont, undefended, was occupied by the Germans. On the following day, in view of the possibility that Fort Vaux might shortly fall into the hands of the enemy, orders were issued for its complete demolition.

These, however, could not be carried out, as it was found that a 17-in. shell had destroyed the electric cables and means of firing the charges. Meanwhile, it had been discovered that the concrete casemates and cupolas of the modern forts had suffered little damage in spite of the violent and persistent bombardment by shells up to 17-inch. General Pétain, who assumed command on Feb. 26, therefore ordered the forts to be reoccupied, put in the best state of defence possible at the time and the demolition charges removed. The intervals between the forts were also to be held to prevent any infiltration. Lt.-Col. Tournes, in an article in the *Revue Mil. Française* of May and June 1923, vividly describes his experiences while holding Fort Vaux, emphasises the great value of the protected observation posts and shell and shockproof casemates, and deplors the lack of any telephonic communication, subterranean passages to the rear and the absence of the flanking guns which had been removed from the Bourges casemates. After months of heavy fighting Verdun was successfully held. The permanent forts with their shell-proof casemates and protected observation posts had proved their value as a part of the trench zone, and had probably saved many casualties. On the other hand, purely field defences such as those of Mort Homme, sited in equally important natural positions, resisted the fiercest attack for many weeks, and exacted an even greater toll of lives before they fell.

*Defences of the German Western Frontiers.*—In 1870 Moltke wrote: "The most powerful defence is a network of good railways, and the best protection of these railways is the offensive." However, in 1895, Von Schlieffen, whose plan it was to invade France through Belgium, considered it necessary for the success of his plan to have in Alsace-Lorraine a pivot of manoeuvre which could be held with the minimum of troops and strong enough to withstand any attack by the French. Metz and Strasbourg were therefore strengthened, and in 1900 their radius of action increased. At the same time the defences of Metz were extended 25 m. northwards along the Moselle to connect with Thionville, while 10 m. west of Strasbourg the new fortress of Mutzig was built to close the road over the Vosges across the Col de Saales. In these defences a new form of fortified work known as the "feste" appeared.

This, as its name indicates, is rather a self-contained fortress on a small scale than a fort in the old sense. The "festes" built just prior to 1914 covered a large irregular area some 1,200 yd. in depth and width. Within their wired perimeter were sited all the elements of the defence both for infantry and artillery. Strong self-contained infantry works were situated at each of the salient angles; while the batteries (generally 6-in. howitzers and 4-in. guns) were dispersed within the area with their weapons in revolving steel cupolas embedded in concrete. Ditches 20 ft. deep, wired at the bottom and flanked by loop-holed galleries, protected the outer face of the infantry works. Each battery and work was surrounded by wire, and the main perimeter wire sunk 6 ft. deep and flanked by the redoubts. There were numerous steel and concrete command and observation posts for the artillery and infantry, and casemates protected by 9 ft. of concrete were provided for the whole garrison. Deep underground galleries and a complete telephone system connected the various parts of the "feste."

These "festes" were never subjected to the test of war, but the fortifications of Thionville-Metz fulfilled their rôle as a pivot of manoeuvre and prevented any French advance while the great wheel from the northward was being carried out.

FIG. 1.—Plan of "Feste": a1, a2, main infantry works, b1, b2, etc., concrete casemates. c1, c2, etc., armoured batteries (c5, dummy). d1, d2, artillery observation posts. e1, e2, etc., armoured infantry O.P.'s. f1, f2, etc., posts for enfilading obstacles and ditches. g, infantry look-out posts.

*German-Austrian-Russian Frontier.*—The fortresses of Poland and Galicia differed from those of France and Belgium in that they were purely ring fortresses, designed to hold the few and therefore very important road and railway junctions of Poland. Of these Modlin (Nowo-Georgiewsk) was invested and rapidly fell by siege, Brest-Litovsk and Grodno fell as parts of the battle line, Dęblin (Iwangozrod) was evacuated by the threat of an encircling movement, while Przemyśl alone was successful in withstanding a siege.

In Sept. 1914 the Austrians, driven back in Galicia, left a garrison of about 60,000 men in the fortress. The defences consisted of 65 forts of the early Brialmont pattern (1854) disposed on a perimeter of 35 miles. The concrete was thin and few shelters were capable of withstanding 6-in. howitzers. During the first months of the War, however, trenches protected by strong wire entanglements had been dug in the advanced positions and in the intervals between the forts. Przemyśl, invested by the Russians on Sept. 24, held out against vigorous attacks for three weeks until relieved, caused the attackers 70,000 casualties and detained 250,000 men from the main Russian offensive. In the interval between the first and second sieges, ammunitions and rations for 2½ months were brought into the town. On Nov. 4 the fortress was again invested by a force of 8½ Russian divisions, but without super-heavy artillery. The defenders, by a very active defence and constant sorties, held out for 4½ months, until the last ounce of food, including 21,000 horses, had been eaten and all the ammunition expended. On March 22 1915, having blown up all the guns and the greater part of the works, the defenders surrendered. They had caused the besiegers heavy casualties, blocked the communications of the main Russian Army, and detained a force of twice their own number. Przemyśl, now held by the Russians, was attacked a third time on May 14 1915. The principal forts which had been demolished in March had not been repaired, and ammunition was lacking. The Austro-German Army brought up 12-in. and 17-in. howitzers and bombarded the defences. By the 31st the ruins of the three northern forts were captured, and the Russians, removing their guns, stores and ammunition, withdrew.

The value of both field defences and an active defence is clearly brought out in the first two sieges, while the overwhelming power of superheavy artillery is shown in the third. On the German frontier the fortresses of the Vistula—Toruń (Thorn) and Grau-

denz,—were never attacked. Of the forward line, however, Königsberg held two Russian army corps from the battle of Tannenberg; and the small fortress of Lötzen, with a strong line of field defences, flanked by the lakes, never gave way.

*Trench Systems.*—While fortresses and permanent works were falling into disrepute, and the forts gradually merged into the field defences, the continuous trench lines of the Western Front were assuming the aspect of a fortress. The German Wotan-Siegfried (Hindenburg) lines were deliberately planned, with concrete machine-gun and observation posts, masses of wire, deep trenches, tunnelled communications and dug-outs, and were essentially a part of the fortress of Germany besieged by the Allies. A properly organised trench system, having depth and well placed wire and machine-guns, provided its flanks were secure, was found capable of resisting the strongest attacks even after a heavy bombardment. This was the case in all theatres of war, whether in France, Gallipoli or Mesopotamia. The old methods of siege warfare, attack from parallels with bomb and mortar, sap and mine, were therefore revived, and it was not until the advent of a new weapon—the tank—and the arrival of unlimited artillery ammunition that these defences were definitely overcome. The resistance of these field defences to shell fire due to their dispersion and concealment was remarkable. Of their elements, two stand out as of the greatest value—the concrete "pillbox" or machine-gun emplacement and the deep dugout, the one as a protection for the weapons which were required to fire at short notice and the other for command centres and the counter-attack reserves.

*Effect of Bombardment on Forts.*—The difference in the degree of resistance to shell fire shown by the various forts is remarkable. Manonvillers, though not entirely modern with its two steel cupolas, disappearing 6-in. guns and casemates protected by 8 ft. of ordinary concrete, became a blazing inferno under the rain of 17,000 shells directed upon it. The garrison, after two days, blinded by the dust and fragments, asphyxiated by the fumes of the constantly bursting shells and almost demented by the concussion, were rendered quite incapable of defending the fort, which was captured by the Germans without the loss of a single man. The forts of Liège and Namur similarly, when subjected to the concentrated fire of 17-in. howitzers, were soon rendered untenable; casemates were penetrated, cupolas overturned and the whole structure reduced to ruins. On the other hand, the more modern forts of Verdun appeared to have withstood the heaviest bombardments without vital damage. French writers claim that of the steel gun cupolas only one was permanently destroyed. Forts Moulainville and Vacherauville received 6,000 to 8,000 shells, each of which, in the case of Moulainville 330, were 17-in., without permanent damage to casemates or turrets. In Fort Vaux the only cupola that was destroyed was one from which the demolition charges laid by the French had not been removed. These charges were detonated by a German shell.

The difference in the performance of the forts was due to the higher quality of the French concrete, which was mixed with a large proportion of cement and laid with the greatest care to ensure that the masses were monolithic without lines of cleavage. Also to the great thickness and to the large masses which are necessary to withstand the overturning and disruptive effects of bombardment. The French cupolas had 30 cm. thickness of steel compared with the 22 cm. of the Belgian and German ones. The Belgian forts were large, crowded and conspicuous targets; they contained guns of the main artillery armament and were sited on commanding positions. In spite of the lessons of Port Arthur, they were only built to withstand shells up to 8-inch.

The Italian barrier forts in the battle of the Isonzo failed because their armour and concrete were not sufficiently thick and there was no protection against gas, while the small Austrian works in the south of the Tirol, although bombarded by 12-in. howitzers, held out for months.

## II. PRINCIPLES OF MODERN FORTIFICATION

*Value of Permanent Works.*—From the lessons of the value of permanent works in the War there have grown two schools of

thought. On the one hand it may be argued that the fortresses on the Franco-German frontier completely justified the money expended on them. By their existence they forced Germany to violate the neutrality of Belgium and so brought the British Empire against her. The more modern forts proved their ability to resist bombardment by the heaviest shells and saved many casualties. Verdun as a pivot of a battle line was of incalculable value during the decisive battle of the Marne, and later as a bastion in the trench system. Liège, in spite of its comparatively rapid fall, gained the Allies at least four days, enabled the French V. Army to change front and the British to come into line. Antwerp kept two German corps from the decisive front, and "every day gained at Antwerp meant a French port saved." Maubeuge, Przemyśl, Königsberg all detained important forces from the battles of the Marne, Cracow and Tannenberg. Strasbourg and Metz-Thionville fulfilled their rôle as the immovable pivot for the great German wheel. The expenditure on keeping these fortresses up to date was not great. The average annual amount spent on the defence of Verdun and the heights of the Meuse for the 40 years prior to the War was £200,000, *i.e.*, less than the cost of a destroyer; while the total spent on Metz was about equal to the cost of a modern battleship. Battleships are not expected to last more than 12 to 15 years; they are then considered obsolete, and replaced.

The other school of thought point out that the inherent weakness of fortresses is in their immobility. Once built they remain, and when war comes may not be in the right place. They contravene many of the important principles of war—offensive action, surprise and mobility. Their position and extent is accurately known. They rapidly fall out of date and are expensive and difficult to renew. Apart from the expense involved, their reconstruction is a heavy feat of engineering, and not only takes time but frequently renders them useless for the period of the repairs. In 1914 four of the principal works of Belfort were out of action as they were being rebuilt. New weapons for their destruction are rapidly invented and made. Manouvillers, Liège, Namur and Modlin (Nowo-Georgiewsk) were destroyed with ease and rapidity. Reliance based on the security afforded by fortresses may be a delusion. Of the three great entrenched camps of Antwerp, Paris and Bucharest, designed as a refuge for the Government and Army, not one performed its rôle. Antwerp, on which much money had been expended—and therefore considered by the Belgian nation as up-to-date, was given up by the field army and Government as soon as it became a question of withstanding a siege or continuing the war in the open. Bucharest was surrendered as the result of a battle in the foreground; while Paris, though it held as a part of the battle line, was evacuated by the Government.

Field defences, by their concealment, dispersion and facility for rapid renewal, are just as effective for defence as permanent fortification. It was not the permanent forts of Verdun and Przemyśl but the trench lines of the advanced positions and intervals that stopped the enemy. At Verdun the important tactical position of Mort Homme, defended by nothing but field defences, held out against the heaviest bombardments and attacks for six weeks, and caused the attackers terrible casualties. The expenditure is undoubtedly great, and the money could be more profitably spent on the field army, since if the field army is overwhelmed the fortresses must fall.

The answer probably lies between these two points of view, and the line taken will depend on the situation of the country which has to solve the problem. For France and Poland, in close proximity to powerful and potential enemies, the matter is an actuality; while for Great Britain or the United States, except in regard to coast defence, it borders the realm of theory.

Fortresses are expensive and slow to build; if they fail to gain the time they were calculated to gain, or require for their defence more men than the enemy would require to mask or neutralise them, they have been built in vain. It is the difficulty of estimating the time that fortresses are likely to hold out against the unknown weapons of the future that makes their value doubtful. For it will always be easier to make new guns or other weapons

to overcome the protection than to increase the thickness of armour or concrete.

There are, however, occasions when material defensive preparations in peace time will have to be made and areas held for military, industrial or political reasons. Munitions play so vital a part in modern war that the retention of certain areas of manufacture or supply may be essential. In other places, where for purely military reasons it might be wiser to withdraw and demolish the communications, public opinion may insist on a forward position being held. Again, the effect of the systematic destruction of industrial areas by an invader is now so great that victory even cannot efface all trace of his presence. Every effort will therefore be made to fight on enemy's ground. But to protect areas until the effect of the offensive is felt, and to economise men so that the striking force is at a maximum, some form of permanent fortification built in peace will at times and in certain places be required. The question is, What form will it take?

*Ring Fortresses Obsolete.*—From the lessons of the War it appears that ring fortresses are doomed. It was not Verdun the ring-fortress, but Verdun as a solid bastion of the battle line, that resisted all assaults. The immense perimeter now necessary as a protection against long-range guns requires a vast garrison, and for the ammunition and supply of this garrison for any length of time railway communication must be kept open. Moreover, an extended perimeter is no protection against bombing aircraft.

There are, however, rare occasions when for political considerations it may be necessary to hold a ring fortress for a limited but definite time. In the northern salient of Poland it is conceivable that the Poles for political reasons alone might wish to retain command of Wilno (Vilna), while withdrawing from the salient until their field army was mobilised and ready to take the field. Zone fortification has its uses, but the maintenance of an unbroken front depends on the security of the flanks. Where a position is long and open, its defence by a continuous zone is impracticable. But when the flanks are secure, as with the Chatalja lines of Constantinople or on the Viborg Isthmus between Lake Ladoga and the Gulf, a fortified zone is of great value.

In other cases defensive curtains or limited zones of defence may be essential to delay and impede an enemy's advance; but when these zones are turned and surrounded they will be of no further use. Some form of parabolic front of defence may, therefore, delay this end. For the same reasons the construction of barrier positions in undeveloped or mountainous countries, combined with a complete destruction of communications in front of the positions, may be advisable. The difficulty and time taken to bring up heavy artillery for their reduction would enable them to justify their rôle of delaying action. Had the Rumanians fortified the passes of the Carpathians before or directly after their declaration of war, the German attack of Nov. 1916 might have failed. But if in the future anti-aircraft artillery is unable to prevent accurate aerial bombing, the use of barrier positions will be further restricted.

The devastation of zones and communications will, however, remain a powerful weapon of defence. This can seldom be carried out in industrial areas, but in less developed countries or where communications are restricted thorough and complete demolitions will cause a modern army considerable delay. The thorough demolition of a tunnel will take months to repair, and the delay caused will be greater than that affected by a barrier fort. In 1918 the destruction of the roads and railways by the retreating German armies delayed the Allies more than their resistance; while the total destruction of the communications in the area between Maubeuge and the Ardennes in 1914 would have had far-reaching effects.

The value of field defences, which can be rapidly made in accordance with the latest tactical ideas and sited in positions found most suitable at the time, is undoubtedly very great. With well sited and concealed machine-guns, anti-tank guns and obstacles, covered by the fire of artillery (itself protected by mobility and concealment), positions will have considerable powers of resistance. These will be increased if certain previous work can be carried out in peace time.

*Preparations in Peace Times.*—The degree of material preparation attempted in peace time will vary considerably; but in all places where a defensive attitude is considered likely the most important means will be the preparation of complete plans and schemes of defence. The position of battle headquarters, observation posts, machine-guns, batteries with several alternative positions, infantry localities, lines of communication and zones of obstacles will be selected, and large scale maps prepared ready for issue. Arrangements will also be made for the work to be done at the shortest notice, and for the defence schemes to be revised and periodically brought up to date to keep pace with modern requirements.

Where it is decided that for military, economic or political reasons some degree of permanent fortification in peace time is necessary, the limitation of military expenditure will control the amount that can be carried out. Within these limits the following will probably be considered:—

(a) The provision of an obstacle against a "coup de main" carried out by cross country armoured vehicles. Waterways and inundations such as those of Fortress Holland or the Yser afford protection, while judicious afforestation would limit the lines of approach. Where these are lacking, ditches with one vertical face or minefields covered by fire would be required.

(b) Arrangements for air defence, gun and searchlight emplacements, telephonic communications and sound-location installations.

(c) The provision of observation posts for artillery, infantry and intelligence services—concealed, dispersed and protected by armour or concrete, with sufficient interior space for the observers to use their glasses and maps and remain in comfort for some hours at a time.

(d) The provision of road, rail and tramway communications or improvement of existing ones, both laterally and from front to rear, in order to facilitate the rapid movement of troops, artillery, ammunition and stores.

(e) The provision of a complete system of signal communication with cables buried eight feet deep, connecting all headquarters, observation posts, artillery positions, anti-aircraft defences, sound-ranging and flash-spotting posts.

(f) Afforestation to give cover from aeroplane observation to facilitate surprise; and the control of building and planting so as to keep clear the field of fire or view.

(g) Construction of shell-proof cover for command posts, signal offices, observation posts, artillery and machine-gun personnel and local reserves, either in mined dugouts 50 ft. deep or in concrete chambers. To give protection against bombardment by the heaviest weapons of the present day at least 6 ft. thickness of ferroconcrete is required, and large masses are necessary to mitigate the effect of concussion and overturning.

(h) Construction of subways 50 ft. deep to give protected communication from the rear to important infantry localities, and to connect up the various dugouts. Some of these subways would contain tramways, and their entrances and exits would be carefully concealed.

(i) Arrangements for the electric lighting of all subways, dugouts and chambers, their gas-proofing and the supply of pure air.

(j) Provision of landing grounds for aircraft kept free of obstructions and provided with sunken sites for hangars to minimise the lateral effect of air bombs.

(k) Organisations of important infantry tank-proof localities with obstacles, fire trenches and alternative and concealed machine-gun positions.

Whatever the form or degree of fortification adopted may be, one can seldom rely on the theory of complete protection, or say, like Pétain at Verdun, "On ne passera pas." To gain time and economise force are the objects of fortification, and the essence of defence lies in organisation, concealment, observation, communication and the stout hearts of well-armed men.

### III. MILITARY MINING

*Mining in Trench Warfare.*—Although no new methods had come to light, considerable experience had been gained as to the value and practice of mining during the siege of Port Arthur, and the conclusions reached up to 1910 are described in 10.716. At the commencement of the War the power of the heavy howitzers, which had so rapidly destroyed the Belgian forts, appeared to indicate that for the reduction of fortresses mining would be unnecessary. It soon, however, became evident that with the advent of position warfare, and the difficulty of making any advance above ground in the face of machine-guns and barbed wire, the

attack of important localities by mining would be advantageous. Further, the opposing trench lines approached each other so closely that a bombardment of the hostile front trenches could not be carried out by either side without damage to their own. The tactical conditions, which resembled those of fortress warfare, being favourable, the Germans commenced mining in 1914, and by Dec. had exploded mines in several sectors along the front. As a result the Allies were compelled to countermine in reply.

At first these mine systems were shallow—rarely being deeper than 20 ft.—but by 1915 there were a great number of them, and special units and tunnelling companies were formed to carry out the work. For these R.E. units coalminers were enlisted, and the officers selected from those who had mining engineering experience in all parts of the world. In addition, for work in the clay areas, a number of specialists known as "clay kickers" were included. These men, working on their backs and supported on a board, could make rapid and silent progress by using their feet to push a special shovel into the clay. To co-ordinate the work along the whole front a mining staff was established and the advice of expert geologists obtained. By the middle of 1916 the British had 25,000 troops on underground work, and probably over 60,000 men were so employed on the Western Front. During 1915 and 1916 mining continued on an unprecedented scale, and deep systems down to 200 ft. were made. Mines were effectively used in the opening stages of the battle of the Somme, 1916, and some brilliant mine attacks were carried out by the French. A few instances of mining also occurred on the Italian front and in the Dardanelles campaign. It was, however, during the attack on the Messines ridge in 1917 that mining reached its greatest achievement. At 3:10 A.M. on June 7, on a front of 9 m., and within an interval of 30 sec. no less than 20 mines, containing 1,000,000 lb. of explosives, were detonated. The largest of these mines (at St. Elloi) was 125 ft. deep, took months to complete, and contained 43 tons of ammonal, while the earth shake was clearly felt at Cassel, 16 m. away.

The use of these enormous mines, whose destructive effects could not be definitely foretold, was a matter of some anxiety, but they were certainly successful. Ludendorff writes in his memoirs: "We should have succeeded in retaining the position but for the exceptionally powerful mines used by the British which paved the way for the attack. . . . The moral effect of these explosions was simply staggering. At several points our troops fell back before the onslaught of the enemy's infantry."

With the introduction of tanks and certain changes in the tactics of the defence, offensive and defensive mining declined. The tactical results obtained by mining had seldom been worth the labour, time and material expended, and when the front line was no longer strongly held mining objectives were lacking. The mining units were consequently employed on the provision of underground protection against the increasing bombardment by artillery and bombing aircraft. Deep dugouts for the protection of reserves, headquarters, signal offices, dressing stations, etc., and subways for underground communications were constructed. These subways, lighted by electricity, and containing water mains, telephone cables and tram lines, were of considerable extent. On the Vimy front there were 12 subways with a total length of 6 m., while east of Béthune it was possible to patrol four m. underground. Use was also made of the old underground quarries of Arras, which, provided with bunks, cookhouses, latrines, telephones, lighted with electricity and connected by subways to the front line, could accommodate 11,000 men.

*Technical Progress.*—Efforts to speed up the work at the mine face with the help of mechanical instruments have so far been unsuccessful. The labour and difficulty of disposing the spoil and concealing it from air observation made it essential that the galleries should be small in section—4 ft. 10 in. by 2 ft. 9 in. the normal size. In this confined space it is difficult to use a machine, and reliance is still placed on the miner with his pick, shovel and grafting tool.

While the actual method of making mines has altered but little, considerable improvements have been made in instruments and

accessories. The miner's dial and "dumpy level" facilitate the accurate alignment and levelling of shafts and galleries. Light is provided by electricity, and ventilation improved by means of mechanical fans and blowers. Ammonal and other high explosives have replaced powder.

For mine rescue work, to overcome the great danger of gas poisoning by carbon monoxide, Proto and Salvus sets are used; while mine stretchers enable a man to be dragged along a gallery and lifted out of a shaft. But perhaps the most important advance is in the provision of listening apparatus. Two types are used—the geophone, which works on the principle of the stethoscope, and the seismophone, which is an electrical detector. With two geophones the direction of the source of the sound can be obtained, while with seismophones (which do not give direction) one operator can listen in several galleries if they are connected up to the switchboard of a central listening chamber.

Schwarte, *Militärischen Lehren des Grossen Krieger*, chap. 2 (1920). (E. H. K.)

**SIENKIEWICZ, HENRYK** (1846-1916), Polish novelist (see 25.54), died at Vevey, Switzerland, Nov. 15 1916.

**SIERRA LEONE** (see 25.54).—In 1911 Sierra Leone acquired the Kanre-Lahun area from Liberia in exchange for a district on the Morro river. Revised estimates give the area of the colony and protectorate at 27,250 square miles. Population (1921) 1,541,311. There were 1,161 whites and 599 Asiatics, mostly Syrian traders. The native population had increased by 137,000 since 1911. Freetown, the capital and chief port, had 44,142 inhabitants.

Steady, though somewhat slow, progress has been made since 1910 in education (vocational as well as literary), in sanitation, in communications and in better social conditions generally. In 1920 the importation of "trade spirits" was totally prohibited; in 1926 the last vestige of Government recognition of domestic slavery was withdrawn. Political progress was marked by the grant in 1924 of a new legislative council which contained three members elected in the colony on the basis of manhood suffrage, and also direct (nominated) representation of the protectorate. A notable event in 1925 was the visit to Freetown of the Prince of Wales.

**Industry and Trade.**—Commercially, Sierra Leone is still dependent on the products of the oil palm and on kola nuts, while ginger is the chief of the lesser exports. Experiments in the cultivation of cotton and maize for export were unsatisfactory, but promising new crops were cocoa, swamp rice and coconuts. During 1910-3 trade developed satisfactorily, and in this period a railway to serve the northern province was begun. It was completed to Kamabai, 182 m. from Freetown, in 1916. The World War caused a great shrinkage in trade, Germany having taken 87% of the export of palm kernels. The War, however, demonstrated the loyalty of the natives to Great Britain, and the Sierra Leone forces played a prominent part in the Cameroons campaign. In 1918 there was a severe epidemic of influenza at harvest time and this, added to adverse weather conditions, led to a famine in 1919, which was marked by serious rioting, the Syrian traders being accused of hoarding foodstuffs. The year 1920 was one of great activity and inflated prices. It was followed in 1921-2 by a period of financial stress, but by 1923 trade had revived and in the two succeeding years steadily increased.

Taking 1913 and 1924 as normal years, imports (which are mainly foodstuffs and cotton piece goods) increased from £1,292,000 to £1,475,000; exports from £1,490,000 to £1,510,000. (In 1920 imports had been £3,175,000 and exports £2,916,000). In 1924 Great Britain took 97% of the palm kernels and supplied 65% of the imports. Revenue in 1913 was £618,000 and in 1924 £868,000. Expenditure in 1913 was £622,000 and in 1924 £777,000.

and annotated (1925); Sir A. R. Slater, *Sierra Leone*, an address by the Governor reviewing conditions in 1925 (Freetown, 1925); and the annual *Reports on Sierra Leone*, published by the Colonial Office, London. (F. R. C.)

**SIGNALLING** (see 25.71).—The functions of signal communications in the field are threefold, namely:—

- (1) To enable information to be transmitted from front to rear, so that the higher command may know the course of events in the forward area and the administrative requirements of the troops;
- (2) to enable orders to be transmitted from rear to front, so that the higher command may exercise effective control;
- (3) to facilitate co-operation in battle between different bodies of troops and different arms, and between troops and aircraft.

The importance of these functions increases with every advance in the application of mechanical science to war. When armies fought in close order and generals commanded from the saddle, effective control could be exercised by means of gallopers bearing orders to different parts of the field. To-day infantry and machine-guns, artillery, tanks and aircraft have to act together in a concerted effort which demands the closest intercommunication. A modern commander is provided with an instrument of unprecedented striking power but of such complexity that it cannot be controlled without a very complete system of signal communication.

**Provision of Signal Communications.**—In the British Army the responsibility for providing signal communications is shared between the Royal Corps of Signals and the regimental signallers of cavalry, artillery and infantry units. The sphere of the Royal Signals extends from the base forward to the headquarters of regiments, batteries and battalions. Within these units communication is provided by their own regimental signallers. Each formation, whether division, corps, army or lines of communication, has a unit of the Royal Signals allotted to it to provide communication between its commander and his subordinates as well as with commanders of formations co-operating with him.

**Methods Employed.**—Four means of intercommunication are employed. These are: 1. Message-carrying by runners, dispatch riders and sometimes pigeons. 2. Visual telegraphy by lamp, flag or heliograph. 3. Line telegraphy and telephony. 4. Wireless telegraphy and telephony.

A sound signal system demands all four methods, co-ordinated so that each by its special capabilities makes good the weak points of the others. Reviewing each in turn, it may be said that the first, the oldest method of all, remains one of the most important. In the confusion of the infantry fight the runner is often the only possible means of conveying information and orders. At the same time, in the most highly organised signal system the dispatch rider on horse or motor-cycle is indispensable. His usefulness lies in the great volume of correspondence he can carry, and his rôle is to release the telegraph for its legitimate work of sending short and urgent messages without delay. On the other hand, a dispatch rider may be killed or captured with dispatches on him, while his use may be forbidden by natural obstacles or a hostile population. The use of pigeons is limited by the fact that they take a considerable time to learn their way to a loft in a new position. Consequently, they cannot be employed in mobile warfare. In static operations between fixed opposing lines they have proved valuable.

The next method, that of visual telegraphy, has its chief use in the forward area, where complicated electrical apparatus cannot be carried. A small electric lamp is the most generally used instrument for both day and night, except in sunny climates, where the heliograph is extensively used in daytime. The flag under modern conditions is often too conspicuous for use under fire. An important branch of visual telegraphy is the display of signals on the ground, in the form of white canvas strips, to convey information to friendly aircraft.

Thirdly, there is wire communication, for which the medium varies from light cables laid on the ground in the forward area to heavy overhead routes of the regular G.P.O. pattern on the lines of communication. Communication by wire is the best method of all when it can be established and maintained. It carries a greater volume of traffic than any other means, and it

allows telephony to be used. It is comparatively secret, and any number of lines can be run in a given area without mutual interference. The military drawbacks are that a great weight of cable and other material has to be carried; the lines take time to construct; their maintenance absorbs many men, and they may be cut by shell fire or bombing, by raids, enemy agents or a hostile population. So vulnerable were the field cables to shell fire on the Western Front in the World War, that in long established sectors they were buried six ft. or eight ft. under ground.

Finally, we have wireless. This avoids all the drawbacks of line telegraphy, but it has weaknesses of its own. It is easily intercepted by the enemy, and if cipher is used to counteract this it entails serious delay. Communication is liable to interruption by atmospheric disturbance, by our own or neutral stations or by the enemy. The apparatus is delicate, and the technical training of the men is slow and costly. The number of links of communication which can be established in any area, without mutual interference, is limited. But some of these drawbacks should pass in time, and wireless communication has two great advantages. The first is that it is the only effective means of communicating between aircraft and troops; the second is that it reduces the extent to which a commander is tied to a telegraph line. Beyond these palpable facts is the less solid, but no less important, consideration that wireless offers the greatest possibilities of development to meet the needs of the future; whereas the older methods have been exploited, so far as can be seen, almost to their limit. The wireless apparatus ranges from light forward sets carried on a pack animal or on men's backs, for use within brigades, to semi-permanent installations with a range measured in hundreds of miles for use between stationary and widely separated headquarters.

*Principles of Employment.*—Signals, like every other branch of war, are subject to the principles of economy of force, security and co-operation, and certain rules have been evolved under the stress of experience for applying these principles. The means are economised by making no attempt to provide a direct link wherever communication is required between two points; a system of signal centres is established instead, connected from front to rear and laterally, so as to cover the theatre of operations with a grid of signal communications. Each link of the grid is made as strong as possible by employing on it not one method only, but as many of the four means as are available.

Every headquarters is then either sited at a signal centre or gains touch with the system through the nearest signal centre. In the back area a signal centre may consist of an important signal office at a junction of permanent wire routes with a number of telegraph instruments and a large telephone exchange, several long range wireless stations and a group of motor cyclist dispatch riders. In the forward area it may merely have a small man-carried wireless set, a signalling lamp and a few runners.

During an advance the headquarters of each leading formation moves forward by bounds, establishing at each halting place a signal centre connected with its subordinate headquarters, those on either flank and the higher formation in rear. The higher formation moves forward in its turn, takes over and consolidates the gridwork thus formed, and embodies it in the rearward administrative system.

Co-ordination of the four methods is secured by establishing a signal office at every important headquarters in the field. The signal office controls all the available means of intercommunication at the disposal of the headquarters concerned. It contains the line telegraph instruments and telephone exchange; the wireless stations are sited as close to it as possible, and the dispatch riders are within call. All messages for transmission are handed in there; they are registered briefly so that they may be traced at any time, and are then either handed to a dispatch rider or a telegraph operator, to go by whichever one of the four methods is most appropriate. All messages destined for a headquarters go first to the signal office, whence they are distributed to the officers concerned. For signalling on railways, (see RAILWAYS).

See H. M. Dowsett, *Wireless Telephony and Broadcasting*, vol. 1 (1923). (C. Tr.)

**SIKHISM.**—When Sikhism revived (see 25.84) its divisions also sprang into new life. In the main democratic in political and congregational in religious government, the Sikhs had passed through a monarchical phase under Mahārāja Ranjit Singh and his successors, a phase reflected dimly in a Hinduising tendency in religion. In the soil of India the reformer may graft exotic ideas upon an indigenous stock, but, sooner or later, the alien growth wilts and the old type reasserts its vigour. The Sikh, not unlike David Deans, prone to evolve his own principles and practice, retained his many sects and orders; but all tended to revert to an indigenous type. The strict Sikh neglected all but a few outward signs of his adhesion to the Gurūs, while the laxer brethren became virtually Hindus, worshipping Hindu gods and, perhaps more especially, goddesses, early legends attributing even to Gurū Govind Singh the patronage of Devi, the goddess, and merely adding the Sikh Gurūs and many minor holinesses to the Hindu pantheon.

*Hinduising Tendencies.*—One sect indeed retained its vitality. The Kukas or "Shouters," always credited with hatred of British rule, maintained in practice an implacable anti-Moslem attitude, which took the shape of carefully planned murders of Mahomedan butchers; it being a characteristic of Sikhism that while it disavowed polytheism it retained the ancient Hindu veneration for the cow and resented the slaughter of kine for food or sacrifice. The sect never regained much influence or repute. Its ethical teaching in its inception was probably that of Govind Singh, but it is said to have fallen to the depths of degradation usual in a secret society. The significance of its emblems, a high, straight turban and a knotted woollen necklace, has never been disclosed, but they suggest a militant asceticism. Of still less moment until recently was the fanatical Akālī order which had given trouble to Ranjit Singh himself. It had sunk to the rôle of mere buffoons at Sikh gatherings, recalling the preaching fox in a mediaeval choir, but its latent militancy has proved to be only too easily fanned into flames. On the other hand, the great Sikh orders of the Hinduising Right, the Udāsīs and the Nirmalas, the "sad" and the "stainless," had retained much of their wealth, prestige and even spiritual influence, but tended to approximate to sacred castes on the model of the Brahmans.

*Failure of the Theocratic Ideal.*—In its ideals a theocracy ruled by its sacred volume, the *Granth Sahib*, Sikhdom once possessed a Convocation in its Gurūmatta or House of Clergy, which might have developed into an effective constitutional body by co-optation of the laity but for its complete disappearance under the military chiefs who arose after the death of the last Gurū. The Sikh monarchs made no attempt to resuscitate it. Hence the Sikh congregation, lacking any organisation or central control, rapidly disrupted. Apart from the great fanes, the village became the only real unit. And the orders were equally unorganised, having at best a titular head whose powers were undefined, no corporate body capable of holding property, and only the weakest agencies for enforcing discipline. Thus when a village, as it often did, built itself a *gurdwāra* or "gurū's portal" for the recital of the sacred books and the teaching of the sacred script, it would elect as its incumbent a brother of a religious order or even a spiritually minded layman.

*The Village Temple.*—This humble temple it endowed with a glebe, but, just as the orders had no written statutes, so the temple rarely, if ever, had a written grant. The incumbent was trustee of the glebe and shrine, but no law of trusts existed. At best he was under the *de facto* control of the village congregation and less definitely under that of his order. But the principles of each order varied. Some leaned towards congregational control, others towards priestly authority. Sometimes a vacancy was filled by the disciple designated by the last incumbent, with or without ratification at an assembly of priests convoked from neighbouring shrines; at others it was filled by a loosely constituted gathering of all who frequented the temple. At times efforts were made to set up something not unlike episcopal control or a royal right of presentation. Yet, whatever the founders' intentions, the terms of the traditional grant, the unrecorded rules of the order, or the unvoiced wishes of the worshippers,

the succession both to the spiritual power of the first incumbent and to the temporal benefits of his endowment tended more and more to vest in a holy family by physical inheritance. Even "celibate" Udāsīs founded families who are owners of wealthy religious properties and rich refectories, though bitter dispute as to division of the inheritance and the right to succeed to the office of chief abbot may from time to time impair their resources. Under Sikh rule such matters were doubtless settled not by rule of law, but by the ruler's will. Still they were settled, and popular feeling probably kept his caprice within bounds, just as it constrained him to prevent gross abuses. With that achieved he and his subjects were content, and if he failed to do more he had before him a precedent in the history of the Ten Gurūs themselves. No one of them had established any rules for the succession to the Gurūship or method for election to that office.

*The Pontificate Itself Hereditary.*—The first, Nānak, had appointed his successor and clearly did not intend the pontificate to become hereditary, yet that principle was promptly asserted by the Udāsīs, who ascribe the foundation of their order to his eldest son and set but little esteem upon the teachings of Govind Singh. And the succession to the Gurūship itself soon became almost rigidly hereditary after the 4th Gurū. The Eastern feeling that holiness runs with physical descent was doubtless further strengthened by the rise of the Sikh aristocracy and monarchy, both hereditary and impelled by self-interest to suppress the elective principle. Hence the history of every ecclesiastical office tended to reproduce in miniature that of the Gurūs' dynasty. But this did not result in reducing all the Sikh endowments to personal appanages of saintly families, and many remained under the rude but effective control of the monarch, the orders and even the people, until power and responsibility passed into British hands.

*The Act of 1863.*—In 1863, however, the British Govt. passed an Act to divest itself of the management of religious endowments, and thereby denuded itself of all power to prevent waste or malversation. The Sikh layman or the religious brother who witnessed the decay of his village *gurdwāra* or the house of his order falling into disrepute could indeed have recourse to the regular law courts, but the complexities of his suit would make it costly beyond the measure of ordinary litigation. To a court trained in the subtleties of ecclesiastical and canon law as laid down for the diverse denominations and varying statutes of religious fraternities in the West the questions arising in such a cause would have been difficult of decision.

*The Lay Tribunal's Failure to Prevent Abuses.*—To courts innocent of such a learning they were insoluble. The arraigned incumbent would deny his pursuer's membership of his congregation or order, the right of any such member to call him to account and plead his own unworldliness as explaining any deficit in his funds or defects in his administration. But matters were worse when the shrine had become in effect purely private property. As their inheritance followed no law but indeterminate custom the courts adopted the fatal principle that in all points each shrine was governed by its own customs, without regard to the general tenets of Sikhism or the particular rule of the order. The minor temples were in effect freed from all control, and to such a depth of corruption did some sink that a professedly celibate priest was heard to depose that no Udāsī was truly qualified for spiritual office until he had seduced a married woman of his flock. Many endowments were wholly alienated to pay for open debauchery, a result the more regrettable in that the beautiful Hindu temples of the Punjab Himalayan cantons owe their preservation to the fact that the executive has retained control of their secular affairs, leaving religious matters to their priests, but nominating their bursars and auditing their accounts.

*Sikh Protests and Lack of Unity.*—Sikh discontent at this state of things was expressed against the administration of the Khālsa College and the Golden Temple, both at Amritsar. The council of the former was reconstituted to the general satisfaction, but owing to internal dissensions the latter offered a knottier problem. For years its calm had been disturbed by theological

disputes, the more orthodox Sikhs resenting its adornment with pictures from Hindu myths painted at the instance of Hinduising brethren, and other lapses from strict monotheism. Eventually a provisional advisory committee of 175 members, partly nominated by Government, was accepted by a large meeting of Sikhs. It was to draw up a scheme of management, but never functioned. At critical junctures the manager, a Government nominee, had intervened on the side of law and order, exasperating some Sikh feeling by bestowing a dress of honour on Gen. Dyer, after the affair of Jallianwāla Bagh, and other steps. Whether the Sikhs had any just cause to complain of his acts as manager is not apparent, but in 1920 on Mahātma Gandhi's suggestion a Sikh public meeting held at Amritsar appointed a Shiromani Gurudwāra Parbandhak Committee—"for the management of shrines."

*High-handed Acts of Shrines Committee.*—This committee, swollen to 240 in number by 60 co-optations, claiming to have been chosen by universal adult suffrage, seized the Golden Temple and other places of worship. But it went beyond mere irregularities in procedure when it reorganised the Akālīs into lawless gangs or *jathas* recruited from more dubious elements than all Sikhdom could supply. One of its earliest steps, in 1921, was an attack on the very birthplace of Sikhism—Nānkāna, the home of Nānak's mother. Dissatisfied with the Udāsī *mahant's* régime the committee called on him to institute reforms, failing which it would eject him on a certain date. Fearing an attack the abbot enlisted mercenaries, many of whom were Moslem Afghāns. This roused fresh resentment that one of the holiest places should be so guarded, and precipitated matters. A gang of Sikhs seized the sanctuary several days before the date notified. They achieved their purpose but made the enclosure their sepulchre. Massacred by the mercenaries, not one escaped. In this encounter 130 lives were lost. The facts that the *mahant* was defending his property and that the initial aggression was on the Akālīs' side were ignored, and feeling against many *mahants*, especially those of the Udāsī order, was aroused.

*Trouble at Gurū kā Bāgh and the Doāba.*—Other lawless seizures of shrines followed. That of Gurū kā Bāgh in 1922 led to much unnecessary suffering, fortunately without loss of life. In Feb. a band of Akālīs had captured that *gurdwāra*, but the *mahant* retained its house and lands. The committee took steps to seize some land, claiming it as appurtenant to the shrine. The law was vindicated but 5,000 Akālīs were arrested. By then, however, the Akālīs had thrown out a new and more dangerous offshoot in the Babbar ("lion") Akālī *jatha*, devoted to the task of murdering village officials and others known to be loyal to Government and virtually defenceless in their isolation. Its proceedings deepened the terrorism already imposed by Akālī bands on the fertile country known as the Doāba, between the Sutlej and Biās rivers, and beyond it, full advantage of the temporary paralysis of the administration being taken by the lawless elements in general to commit murders and organise gang robbery. Misplaced economy reduced the police force to a cadre inadequate to protect life or property, and marked men were assassinated openly and with impunity, the employment of soldiery merely maintaining some semblance of order. Yet when in 1923 riots between Hindus and Moslems occurred at Amritsar the Akālīs not only held aloof but aided the authorities.

*The Jaitoke Affair.*—In 1924, however, their sympathies were aroused by the abdication of the misguided Rājā of Nābha, who had been levying private war against the sister Sikh State of Patiala. The Shiromani Committee, exceeding its mandate to secure reforms of endowments, espoused the Rājā's cause and asked the Sikhs to conduct perpetual recitation of the sacred volume in all temples for his restoration. This behest was carried out in a temple at Jaitoke in the State territory, a manifesto of revolt against the new ruler. The recital was not in fact interrupted, but a seditious meeting was broken up. "Martyr" bands of Akālīs were thereupon organised to march to the temple and continue the recitation. One band, numbering 500 men, was reinforced as usual by a huge mob, and the latter charged the State forces. Fire was opened on it and it lost some

50 men, including 21 killed; but of the *jatha* nucleus only three or four fell.

*The Shrines Act.*—More seizures of shrines followed, but without untoward results, and in 1925 the Sikh Gurdwāras and Shrines Bill became law. It might equally well have been enacted in 1863. It provided, for the first time in Sikh history, legal methods for controlling Sikh religious endowments. Unfortunately, it confessedly allows the minority—the Udāsī and other orders—to go to the wall. For this result the failure of the Sikh orders to devise and enforce statutes for their self-discipline and to secure the rights of their congregations is mainly to blame. The Udāsī order is conspicuously distracted, having four or more suborders, bewildering varieties of garb, usage and doctrine, and tendencies to further disruption. So nebulous a body does not lend itself to legislative incorporation.

*The Revival Anti-Brahmanical.*—Briefly, the genesis of the reform movement may be explained. During the past two decades the Sikhs have swung distinctly to the left, *i.e.*, towards a more democratic, militant, un-Hindu platform. In 1909 their representatives obtained validation by a statute of the marriage ceremony called *anand*—"rejoicing." In Sikh eyes its validity (quite unnecessarily questioned in the courts) consisted in substituting their sacred writings for the sacred fire of the Hindus and in not employing Brahmans at weddings. This simple "reform" was carried by the efforts of the Singh Sabha or True Sikh Union, which aims at purifying Sikhism of accretions. The revival of Sikhism has thus some analogies with that of the Wahhābī sect in Islam. Going back to the teachings of the great Gurūs, the Sikhs are more attracted to the militant teachings of Govind Singh than to the quietist doctrines of Nānak.

*Sikh Services in the War.*—To this rekindling of the martial spirit may be fairly ascribed the fact that while the Punjab as a whole mobilised one man in 28 as against the rest of India's one in 150, the Sikhs in 1917 had supplied about one-sixth of the fighting forces of the Indian Empire with less than a hundredth of its population. And their contribution was almost entirely to fighting units. As an emigrant also the Sikh has achieved much. With the general anti-government movements in India the Sikhs have had no close solidarity. To a great extent the Sikh liability to paroxysms of popular passion is due to lack of education which makes no marked progress among the community, though it is one of the few in India which gives its women instruction in its sacred script. Nevertheless it is markedly less apt to be swept off its feet by incredible rumours or tendentious canards than some better read denominations. At his best the Sikh is dignified, level-headed, and in action sedate. But he has the defects of his qualities. He is reticent, and it is difficult to fathom the real grievances underlying discontent.

**BIBLIOGRAPHY.**—The Sikh has produced little recent literature, but Khazān Singh's *History and Philosophy of the Sikh Religion* (Lahore, 1914) is valuable. Gokul Chand Narang, *Transformation of Sikhism* (1912) and "Sikh Relics in Eastern Bengal," *Dacca Review* (1916), also throw light on Sikh history. (H. A. R.)

**SILESIA, UPPER** (see 25.90).—Article 88 of the Treaty of Versailles (1919) provided that the inhabitants of Upper Silesia (pop., in 1919, 2,280,902) should be called upon to decide by plebiscite whether they would belong to Germany or Poland (see PARIS CONFERENCE). The purely German districts of Falkenberg (pop. 37,526), Grothau (pop. 40,610), Neisse (pop. 7,781), part of Neustadt (pop. 25,000) and Hultschin (pop. 45,552), in northern and western Upper Silesia were exempted from the plebiscite. Up to the day of the plebiscite the supreme authority in the plebiscitary area was to be vested in an Inter-Allied commission, consisting of one representative of France, Great Britain and Italy respectively. In this commission France was represented by Gen. Lerond, Great Britain by Col. Percival and Italy by Gen. de Marini. On Feb. 1 1920 Allied troops occupied the plebiscitary district. The local German officials were then subordinated to the Inter-Allied authorities. The German police was replaced by a special polling police (*Abstimmungspolizei*), composed half of German-speaking, half of Polish-speaking inhabitants.

*The Plebiscites.*—On the whole, the collaboration of the Inter-Allied control and the German officials proved satisfactory; but various differences arose, such as that which led to a strike of judges in May 1920. Both the Poles (under Korfanty) and the Germans opened an active canvassing campaign; and under Polish pressure the Germans in the southern and eastern districts were subjected to oppressive treatment. On Aug. 19 1920 the Poles made an attempt to seize the country by force. Bands, chiefly recruited from Congress Poland, usurped authority. A number of Germans were forcibly carried into Poland, and many were killed. Order was not restored for several weeks. In Jan. 1921 the date of the plebiscite was fixed for March 20 1921. The Polish terrorism immediately revived, especially in the district of Rybnik, Pless, Kattowitz and Beuthen.

It reached its climax in the days preceding the plebiscite. Voters from other parts of the German Reich were frequently refused admission to the polls; sometimes they were maltreated or even murdered; and houses where outvoters were staying were set on fire. The day of the plebiscite passed, however, without disturbance except at a few places, such as Rybnik and Pless, but on the following day the Polish excesses recommenced. The poll showed 717,122 votes for Germany and 483,514 for Poland. In 664 districts there was a German, in 597 a Polish majority. Practically all the towns voted for Germany. There was a Polish majority in the administrative districts of Rybnik, Pless, Beuthen, Tarnowitz and Gross-Strehlitz. The decision of the Inter-Allied Commission as to the allocation of the disputed regions was delayed by differences within the commission itself. The French representative, Lerond, who had from the first been accused of tacitly supporting the Poles, wished to allot the whole of southern and eastern Upper Silesia to them, while the British and Italian representatives wished to apportion the industrial region to Germany. Protracted diplomatic negotiations between Paris, London and Rome led to no result. At the end of April a report became current that the Council of Ambassadors had given only the districts of Rybnik and Pless to Poland.

*Korfanty's Insurrection.*—In consequence of this rumour the first days of May witnessed a new and more serious Polish insurrection. Korfanty had secretly raised a well-organised Polish force which received arms and reinforcements from Poland. He now occupied the whole southeastern part of Upper Silesia, on a line extending from the south of the district of Kreuzburg through Gross-Strehlitz to the Oder in the south. He nominated himself dictator of the districts under Polish occupation, took over the administration, and treated even the Allied officials with such scant consideration that they were obliged to withdraw to Oppeln and the regions not occupied by the Poles. It was only in the larger towns that the Allied troops, supported by the German population, were able to maintain themselves. A further Polish advance was prevented by the German defence force (*Selbstschutz*) under Gen. Höfer, composed of Upper Silesians and volunteers from other parts of the Reich. There was severe fighting between this force and the Poles, especially round Ratibor and Gross-Strehlitz. Col. Percival, the British representative, was obliged to resign owing to ill-health, and was succeeded by Sir Harold Stuart. Attempts by the Inter-Allied Commission to put an end to the insurrection by negotiations with Korfanty having failed, the Allies dispatched reinforcements of French and British troops to Upper Silesia.

After lengthy negotiations which were carried on with the German defence force, which refused to withdraw unless guarantees were secured that the Poles would first quit the field, an agreement was ultimately effected with regard to the evacuation. By June 20 the British troops had again occupied the larger towns, while the Poles commanded the rural districts. As a result of difficulties in paying and provisioning his followers Korfanty now lost control over them. Independent bands plundered the villages, ill-treated the Germans and murdered many of them. In the industrial districts work in many of the mines and iron works came to a standstill. By the end of June the loss suffered by the industrial region was estimated at three milliard marks.

## THE DECISION OF THE LEAGUE OF NATIONS

The French persisted that the greater part of the industrial region should be assigned to Poland. Great Britain, on the other hand, firmly maintained that such a partition would, as Mr. Lloyd George publicly expressed it, be "unfair" to Germany on the basis of the Treaty of Versailles and the result of the plebiscite. There were at one time three rival proposals for partition: (a) the Korfanty line, the extreme Polish demand; (b) the Sforza line, a proposal put forward by the then Italian Foreign Minister; (c) the British proposal, giving Poland only the southeastern corner with the towns and districts of Pless and Rybnik. France was ultimately left in a minority of one on the supreme council, Italy and Japan having adhered to the British view. After prolonged debates and open differences among the principal Allied Powers it was arranged, at a Paris conference in Aug. 1921, that the solution should be entrusted to a commission of the council of the League of Nations. This commission was ultimately constituted by the representatives of Japan, Brazil, China, Spain and Belgium, with the Japanese representative, Baron Ishii, as chairman. On Oct. 20 1921 the text was published of the documents containing the award of the League of Nations on the partition.

The area assigned to Poland contained at least 75% of the aggregate material wealth of the disputed territory. The division here made in the industrial area, previously German, was such that the council of the League declared it to be desirable that measures should be taken to guarantee the continuity of the economic life of the region during a provisional period of readjustment, and to provide for the protection of minorities. It was recommended that a general convention for this purpose should be concluded between Germany and Poland, so as to place Upper Silesia under a special régime during the transitional period, and that an "Upper Silesian Mixed Commission" should be set up as an advisory body, composed of an equal number of Germans and Poles, with a president of some other nationality to be designated by the Council of the League, together with an arbitral tribunal for settling private disputes occasioned by the temporary measures.

The provisional or transitional period was to be 15 years, and certain stipulations were laid down by the League of Nations for the economic arrangements during that period in the "plebiscite area."

(1) Railway and tramway systems, privately owned or municipal, were to continue under the terms of their concessions, and the German state railways were to be put under a joint system of operation. Railway rates were to be uniform. The state insurance of employees in the Silesian railway system was to be undertaken by that system. A single accounts office was to be set up for the whole system. Expenses of new construction were to be charged to a separate account, and borne by the state in whose territory it was carried out; the working capital for operation to be lent by the German State, and interest charged to the account of this system; profits or deficits to be divided between the two countries in proportion to the length of line and amount of traffic belonging to each. (2) The German mark was to be the only legal unit of currency, and Poland was to recognise the rights of the Reichsbank for a period not exceeding 15 years, but by agreement the two governments might modify this arrangement earlier. (3) While the German monetary system was maintained in the Polish zone, the postal, telegraph and telephone charges should be in German currency. (4) The customs frontier should coincide with the political frontier, and the German and Polish customs law should apply, with certain exceptions.

For six months incoming goods from other countries, on which German or Polish duties had been paid previously to the partition, should cross the frontier without duty. For 15 years, natural products originating or coming from one of the two zones of the plebiscite area and destined for consumption in the other should cross the frontier free of duty. For six months, raw, half-manufactured and unfinished products of industrial establishments in one zone, destined for industrial establishments in the other, should cross free of duty; and this should continue for 15 years when the products, as finished, were intended for free importation into the country of origin. Natural or manufactured products originating in the Polish zone should, on importation into the German customs territory, be exempt from duty for three years from the date of the frontier-delineation. As regards export, the two countries should facilitate for 15 years the export of such products as were indispensable for industry in either zone. (5) Poland was to permit, for 15 years, the exportation to Germany of the products of the coal-mines in the Polish zone, and Germany similarly to Poland in respect of the mines in the German

zone. (6) For the 15 years, any inhabitant regularly domiciled or occupied in the plebiscite area should receive a "circulation permit," free of payment, enabling him to cross the frontier without other formalities. (7) Generally, the two countries should respect private rights.

The League followed up its recommendation by organising a German-Polish conference, which met at Geneva on Nov. 23 1921 under the presidency of M. Calonder (former president of the Swiss Confederation), and resulted in the signature of a detailed convention on May 15 1922. The subsequent friction between the two parties living under this convention was not more than was to be expected, considering the antecedents of the League's award. The most serious incidents were a strike in the Polish area over the question of lengthening the hours of work, which lasted from April to Aug. 1924, and an appeal by the German Govt. to the Permanent Court of International Justice under Art. 23 of the convention of May 15 1922. This article provided for recourse to the International Court in case of disputes over articles 6-22 of the convention, which dealt with the rights of Poland to expropriate private property. The Germans claimed that these articles were being infringed, while the Poles contested the court's jurisdiction in the matter. The German case was filed on May 16 1925, and on July 18 the court found that it did possess jurisdiction, so that the trial of the case proceeded. (See GERMAN; POLAND.) (A. J. T.)

**SILK** (see 25.96).—The most important and significant event in connection with silk since 1910 has been that, despite the vast development of artificial silk (*q.v.*), the genuine article has not only held its own but has steadily increased in demand. The chief cause of this growth has been the increasing demand for silk from the United States.

In 1900 the world's total output was 17,211,000<sup>1</sup> kilos. In 1913 the total output was 27,320,000 kilos. It fluctuated during the War, but in 1919 stood at 27,290,000 kilos. The next year marked the commencement of the trade slump, and the first indication of its approach was given by the refusal of the "buyers" to purchase their normal supplies of raw silk. In that year the output fell to 20,349,000 kilos. But the setback was only temporary, and since then output has mounted till, in 1924, the world's total production was 39,100,000 kilos.

*Sources of Supply.*—The principal sources of supply are Japan, China, Italy, the Levant, France, India and Spain, in that order. Of the various producing countries in 1900, 1913 and 1924, unfortunately India and China are not properly distinguished before 1922, but were included with Japan, which was the chief collecting area in the Far East:—

| Countries        | 1900       | 1913       | 1924       |
|------------------|------------|------------|------------|
|                  | Kilos      | Kilos      | Kilos      |
| Japan . . . . .  | 11,037,000 | 20,760,000 | 24,525,000 |
| Italy . . . . .  | 3,275,000  | 3,540,000  | 5,255,000  |
| Levant . . . . . | 2,079,000  | 2,588,000  | 1,095,000  |
| France . . . . . | 736,000    | 350,000    | 335,000    |
| Spain . . . . .  | 84,000     | 82,000     | 95,000     |
| China . . . . .  | ..         | ..         | 7,715,000  |
| India . . . . .  | ..         | ..         | 80,000     |

The manufacturing countries of Europe and the U.S.A. are becoming more and more dependent on Asia, especially on Japan and China, for their supplies of raw material. The year 1924 showed an abnormally high output for Europe, and in particular France had a much bigger production than had been her average for the previous nine years. For example, her output in 1922 was only 198,000 kilos, although the total world's output was 31,660,000 kilos, or the highest previous to 1924.

As France is a very important silk manufacturing centre, the fact is somewhat disquieting. Her consumption in 1924 was 6,031,400 kilos, whereas she produced only 335,000 kilos and had 1,053,476 throwing spindles. Italy, on the other hand, produces nearly as much silk as she uses, the position in 1924 being that she produced 5,255,000 kilos of raw silk and consumed 5,610,000 kilos. The danger is that the important silk manufacturing industry of France is very largely dependent on supplies of raw silk from abroad, and the fact that the main supplies have to be obtained from the Far East means that she and other countries as well, are at the mercy of unforeseen circumstances which may, even temporarily, destroy this source of supply, such as a disease

<sup>1</sup> For full tables see *The Manchester Guardian Commercial Supplement*, "European Textiles," Dec. 10 1925, p. 42.

which attacks the silkworm, an earthquake on a vast scale or serious political disturbances.

On the technical side, nothing very startling has occurred, but it may be that a new invention which appeared in 1925 in Italy may in future years be regarded as important. By this new method the silk can be detached from the cocoon without the use of boiling water, and if this invention proves satisfactory when tried on a large scale two important results will be achieved. Firstly, much illness and even death among the operatives will be eliminated, as the fumes given off in the present process are often very injurious; and at the same time, if desirable, the silkworms themselves, which at present are killed by the boiling water, can be saved and allowed to develop into moths, lay eggs and so considerably increase the supply of silk. In conclusion, it may be added that while the chief demand for silk fabrics is for female attire, an important and comparatively new source of demand is in connection with the development of air navigation, especially for parachutes (*q.v.*).

Rawley, *Economics of the Silk Industry* (1919); G. S. Boulger, *History of Silk* (1920). See also article on "European Textiles," *The Manchester Guardian Commercial Supplement* (Dec. 10 1925). (J. S. M. W.)

**SILVER** (see 25.112).—The annual world production of silver, which exceeded 200,000,000 fine oz. for the first time in 1908, continued above that figure during the next five years. The outbreak of the World War affected the output unfavourably, and the civil wars in Mexico—actively prosecuted during the years 1914–7—still more reduced production, for the Mexican contribution fell from 81,233,887 oz. in 1912 to 22,910,058 oz. in 1915, roughly a reduction of 58,000,000 ounces. The world production in 1914–172,263,596 oz.—was the lowest recorded since the year 1906, 165,054,497 ounces. The official authority for these world statistics is the report of the Director of the U.S. Mint, whose tabulated data from 1910–25 are appended:—

*Silver Production (in fine oz.)*  
(Units of thousands)

| Year | U.S.A. | Canada | Mexico | Central America | South America | Africa | Europe | Australasia | Asia   | World   |
|------|--------|--------|--------|-----------------|---------------|--------|--------|-------------|--------|---------|
| 1910 | 57,138 | 32,869 | 71,372 | 2,027           | 14,477        | 1,037  | 15,992 | 21,546      | 5,257  | 221,716 |
| 1911 | 60,399 | 32,741 | 79,032 | 1,212           | 14,434        | 1,064  | 15,693 | 16,578      | 5,039  | 226,193 |
| 1912 | 63,767 | 31,625 | 81,234 | 2,846           | 13,981        | 1,217  | 15,992 | 14,738      | 5,505  | 230,904 |
| 1913 | 66,802 | 31,525 | 55,486 | 2,136           | 13,126        | 1,056  | 16,446 | 18,129      | 5,308  | 210,013 |
| 1914 | 72,455 | 28,407 | 26,062 | 2,755           | 10,449        | 1,059  | 14,535 | 11,000      | 5,542  | 172,264 |
| 1915 | 74,961 | 26,626 | 22,910 | 2,920           | 13,687        | 1,188  | 15,593 | 9,250       | 5,894  | 173,001 |
| 1916 | 74,415 | 25,460 | 29,771 | 2,603           | 15,580        | 1,203  | 14,001 | 10,700      | 7,070  | 180,802 |
| 1917 | 71,740 | 22,221 | 42,020 | 2,370           | 15,451        | 1,183  | 11,916 | 10,000      | 9,224  | 186,125 |
| 1918 | 67,810 | 21,384 | 62,517 | 2,900           | 14,712        | 1,257  | 12,663 | 9,934       | 9,982  | 203,159 |
| 1919 | 56,682 | 16,021 | 65,904 | 2,800           | 14,753        | 1,272  | 6,990  | 7,188       | 8,240  | 179,850 |
| 1920 | 55,361 | 12,794 | 66,662 | 2,700           | 14,588        | 1,232  | 8,372  | 2,685       | 8,903  | 173,296 |
| 1921 | 53,052 | 13,135 | 64,465 | 2,000           | 15,614        | 1,012  | 7,774  | 5,362       | 8,870  | 171,286 |

| 1923 | 73,296 | 17,755 | 90,859 | 2,500           | 27,323        | 1,544  | 8,674  | 13,819      | 10,240 | 246,010 |
| 1924 | 65,367 | 19,736 | 91,486 | 2,686           | 26,660        | 1,802  | 9,453  | 10,739      | 11,139 | 239,068 |

Messrs. Samuel Montagu & Co., London, estimate the production for 1925 as follows:—

| U.S.A. | Canada | Mexico | Elsewhere | World   |
|--------|--------|--------|-----------|---------|
| 66,000 | 19,000 | 91,000 | 64,000    | 240,000 |

The above table records a drop in the average Australasian figures for the years 1914–9 of about 8,000,000 oz. from the average of the four preceding years 1910–3. This is chiefly owing to the reduced output outside Australia. The very low figures for 1920 and 1921 were caused by prolonged mining strikes and an outbreak of fire at the Broken Hill Mines—the great producing centre in Australia.

Ever since the discovery, about the middle of the 16th century, of the rich silver deposits in Mexico and Peru, the Americans have contributed the bulk of the world's production: in 1924 their proportion was about 80%. Canada has become an important producer following the discovery of rich deposits in the cobalt region of Ontario, uncovered accidentally during the cutting of the Temiskaming and Northern Ontario Railway.

The output in 1904 was 206,875 oz.; and in 1910 reached 32,869,264 ounces. It is quite probable that even more valuable deposits, buried beneath the vast Canadian forests, await similar chance discovery. The increase in the Asiatic contribution is chiefly attributable to the active development, under British management, of the Burmese mines; these mines had been worked intermittently in past times by Chinese labour. The output rose from 105,603 oz. in 1916 to 5,287,711 oz. in 1924.

**Mexican Output.**—The magnificent contribution of Mexico in 1924, amounting to 91,486,136 oz., is by no means the utmost that can be expected from that quarter, though it represented over 37% of the world production. Many wide areas known to be rich in mineralised ore are still untapped, owing to their inaccessibility and to the lack of capital. Given a government whose stability would encourage the entry of foreign capital, and extension of railways, it would be difficult to forecast a limit to the amount of silver which Mexico would produce. Other points worth notice are the gradual exhaustion of the European output, and the substantial increase in the production of South America in consequence of favourable mining developments in Peru. The large production of the United States of America during 1923 was owing to the desire of American mining companies to obtain the high price of 100 cents an oz., paid by the United States Treasury under the Pittman Act. This measure authorised the replacement at that figure of the silver represented by the dollars which were broken up and sold to the Indian Govt. in 1918.

The figures of the world production of silver during the period 1917–24 by no means include all the world supplies for those years, for very large amounts of silver plate were melted and realised, and enormous quantities of silver coins were demonetised owing to the rise in the price of silver, which caused the intrinsic worth of the coins to exceed their nominal value. During 1922 alone over 50,000,000 oz. is estimated to have been placed upon the market. Silver continues to flow, as it has for centuries, from West to East, where it is absorbed by the popu-

lous countries of Asia, mostly in payment for foodstuffs and raw material needed by Western nations. Before the World War nearly 50% of the world's production was thus absorbed. The following are the net imports in the official returns of the Chinese and Indian authorities:—

*Net Imports of Silver into China (in oz.)*

|      |            |      |             |
|------|------------|------|-------------|
| 1910 | 23,756,000 | 1918 | 25,609,000  |
| 1911 | 41,753,000 | 1919 | 57,907,000  |
| 1912 | 20,981,000 | 1920 | 100,976,000 |
| 1913 | 39,205,000 | 1921 | 35,349,000  |
| 1914 | 14,849,000 | 1922 | 43,134,000  |
| 1915 | 20,036,000 | 1923 | 73,243,000  |
| 1916 | 31,259,000 | 1924 | 28,342,000  |
| 1917 | 22,871,000 |      |             |

<sup>1</sup> Net export.

*Appreciation During the World War.*—The annual totals varied greatly, largely owing to the influence of the War upon the Far Eastern demand. China, taking advantage of the high price of silver as compared with gold, exported silver to India and imported gold, later replacing the silver. Indian demand was increased by restrictions placed upon gold imports from the United Kingdom. Failing the unlimited supply of gold to which they had been accustomed, the natives took silver instead. The high cost of commodities in the United Kingdom and allied countries during the earlier years of the War, together with the need of providing small change to the military camps scattered throughout these countries, called for the provision of subsidiary coins on a large scale. Russia, France and Italy were in a similar plight, and even neutrals like Holland came into the market, impelled by rising prices. As the War continued, the greatest strain fell upon India, which had to provide currency for troops and munitions in three great theatres of the War—Mesopotamia, East Africa and Egypt. The stock of silver rupees in the Indian treasuries on Aug. 15 1914 was 3,776 lakhs; on April 7 1918 it had fallen to 1,044 lakhs. The United States Govt., unable to secure rupees to pay for purchases from India, sold to the Indian Govt. 207,000,000 oz. of silver derived from United States dollars lying idle in the Treasury. At the same time the high value of silver was unearthing supplies of silver coin from out-of-the-way places. Manila dollars, the Maria Theresa dollars current in the Arabian Gulf, and Afghan and other coins were put into the melting pot to be reminted into rupees, whilst most of the silver coins of Russia filtered into the interior of Asia in exchange for goods, in lieu of Russian notes, which, before the Russian debacle, were freely current.

During 1914-7 nearly 90,000,000 oz. were shipped from China to India—a temporary measure only—caused by high prices. These heavy movements account for China's large imports of silver in succeeding years. The replacements of these exports, notwithstanding sales of demonetised silver by Germany and other countries during 1919-20, drove the price of silver on Feb. 11 1920 to 89½d. an oz., the highest quotation on record. Drastic measures were then taken by the British Govt. to check the advance in price, which was adversely affecting the value of the rupee. The quality of the silver currency of the United Kingdom and its dependencies was reduced from .925 to .500 fine; the surplus from this source was about 59,000,000 ounces. When this important step was taken by the United Kingdom, the edge of the China demand, then accentuated by speculation for the rise, was blunted. In 1920, 70,000,000 oz. were imported into China from San Francisco and 20,000,000 oz. from London. As the price of silver fell, the United States Treasury commenced purchases in 1920, which were completed in 1922, to replace the silver sold under the Pittman Act to India, and, though the new demand provoked some competition from China, the possibility of shipments of silver from India and supplies of demonetised Continental silver soon restored the market to normal conditions.

In 1924 a new inquiry set in from Europe; silver was acquired for coinage by the governments of Russia, Germany, Austria, Poland and other countries. Currency conditions, however, were still unstable, and some of the newly minted coins, melted into bars, came back to London for realisation after a few months. The employment of silver for the arts and sciences, which languished during the War and in the years immediately succeeding, became more normal by 1924. The amount thus applied is usually about 40,000,000 oz. a year, the great bulk of which is used in the United States. Barring unexpected discoveries, the principal source of supply in the future is likely to be Mexico, should local conditions remain favourable, whilst the great material progress of India, owing to War profits, new industries and a series of good monsoons, will probably keep that great Empire in the forefront of consumers.

**SIMMEL, GEORG** (1858-1918), German philosopher and sociologist, was born in Berlin March 1 1858. Professor of philosophy first in Berlin (1901), then in Strasbourg (1914), Simmel was one of the first academic philosophers to apply philosophy to history and sociology. His philosophy centres round the conception of a spiritual life, various in its forms, and obedient to its own laws, whose external manifestations are to be seen in sociology and the arts. The ultimate theme of his works, which are written in a brilliant and very personal style, is nearly always the connection between life and the metaphysical general principles, revealed to the philosopher in concrete existence. He died in Strasbourg Sept. 28 1918.

Simmel's chief works are: *Über Sociale Differenzierung* (1890); *Einleitung in die Morawissenschaft* (1892-3); *Philosophie des Geldes* (1900); *Kant* (1904); *Die Probleme der Geschichtsphilosophie*, 2nd ed. (1905); *Schopenhauer und Nietzsche* (1907); *Die Religion* (1907); *Philosophische Kultur* (1911); *Rembrandt* (1917); *Grundfragen der Soziologie* (1917); *Lebensanschauung* (1918). See W. Knevels, *Simmels Religionstheorie* (1920); N. J. Spykman, *The Social Theory of G. Simmel* (1925).

**SIMON, SIR JOHN ALLSEBROOK** (1873- ), British politician and lawyer, the son of a Congregational minister, was born Feb. 28 1873 at Bath, and educated at Fettes College, Edinburgh, and Wadham College, Oxford, where he was a scholar. He became president of the Union in 1896, and was subsequently elected fellow of All Souls. He went to the Bar, became Barstow Law scholar in 1898, and was called in 1899. His manifest abilities and the persuasiveness of his advocacy soon brought him to notice; he was chosen one of the counsel for the British Govt. in the arbitration on the Alaska Boundary in 1903; and he rapidly attained so considerable a practice that he was able to take silk in 1908. He had gone into politics, and was elected Liberal member for Walthamstow at the general election of 1906. At first, probably owing to his absorption in his legal work, he did not command nearly so much attention in Parliament as his Wadham contemporary and fellow-lawyer, Mr. F. E. Smith (afterwards Lord Birkenhead). But he gradually made his way, and was appointed by Mr. Asquith Solicitor-General in 1910, was knighted the same year, and became Attorney-General with a seat in the Cabinet in 1913.

On the outbreak of the War in 1914, his resignation, along with those of Lord Morley and Mr. Burns, was confidently expected; but he finally decided to remain with his chief and the bulk of his colleagues. When the first War Coalition Govt. was formed, in May 1915, he was offered the lord chancellorship, but he declined the greatest prize of his profession as he preferred a political career in the Commons. Accordingly he accepted the home secretaryship, and gave up his legal practice. Early, however, in the following year, owing to his inability to accept the Government bill for compulsory military service, he resigned his office and led a fruitless opposition to the measure in the House; and then went out to the front in France as a major in the R.A.F. He subsequently resumed practice as a barrister, and immediately regained his position in the front rank of his profession. On the break between Mr. Asquith and Mr. Lloyd George in 1916, Sir John Simon adhered to the former. He lost his seat in Parliament at the general election in Dec. 1918, but was returned for Spen Valley in 1922. On the occasion of the general strike in May 1926 Sir John Simon argued in Parliament that the strike was not covered by the Trade Disputes Act and his speech, coming from such an eminent legal authority, created a deep impression.

**SIMONDS, FRANK HERBERT** (1878- ), American writer, was born at Concord, Mass., April 5 1878. He graduated from Harvard University (A.B., 1900), after having seen active service in the war with Spain. He became a reporter on the *New York Tribune* 1891, and was its Washington correspondent in 1903 and

its Albany correspondent in 1904. He was Albany correspondent of the New York *Sun* 1905-8. He became a member of the editorial staff of *The Sun* in 1908, editor of the New York *Evening Sun* in 1913, and in 1915 joined the New York *Tribune* as associate editor in charge of its editorial columns. His brilliant articles in *The American Review of Reviews* (1915-8), analysing the military and political situation from month to month, brought him a wide reputation. After the Armistice he continued to contribute articles on international politics to this review and other periodicals. He published, besides other works, *They Shall Not Pass—Verdun* (1916); *History of the World War*, 5 vol. (1917-24).

**SIMS, GEORGE ROBERT** (1847-1922), British journalist and dramatic author (see 25.136), died in London Sept. 4 1922. He published a book of reminiscences, *My Life*, in 1917.

**SIMS, WILLIAM SOWDEN** (1858- ), American naval officer, was born at Port Hope, Ont., Canada, Oct. 15 1858. In childhood he removed to Pennsylvania, and he graduated from the U.S. Naval Academy in 1880. Then for eight years he served on board various ships in the North Atlantic. During 1889-93 he was with the nautical school ship "Saratoga," and then was transferred to the Pacific Station, and later to the China Station. From 1897 to 1900 he was naval attaché to the American Embassy, first at Paris and afterwards at St. Petersburg (Leningrad). In 1900 he returned to the Pacific Station. Convinced of the inadequacy of American methods of target practice, he pressed his views upon the Government, and in the end was enabled to arrange for a gunnery test and prove his claims. In 1902 he was assigned to the bureau of navigation, serving for the next seven years as inspector of target practice, which remarkably improved under his guidance. Meanwhile in 1907 he was made commander and appointed naval aide to President Roosevelt. He became commander of the battleship "Minnesota" in 1909. The following year, during a visit of the Atlantic Fleet to England, Commander Sims caused a stir by certain indiscreet remarks made at a dinner at the Guildhall, London, where he said: "Speaking for myself, I believe that if the time ever comes when the British Empire is menaced by an external enemy, you may count upon every man, every drop of blood, every ship and every dollar of your kindred across the sea." A semi-official protest against this utterance was made at Washington by the German Govt., which took offence at it, but the incident ended in a severe reprimand from the Secretary of the Navy.

In 1911 Sims was promoted captain, and for two years was a member of the staff of the Naval War College, Newport, Rhode Island. During 1913-5 he was in command of the Atlantic torpedo flotilla, and then returned to Newport as president of the Naval War College. When America entered the World War in April 1917 he was chosen to command the American naval forces in European waters. In Jan. he had been promoted rear-admiral, and in May he was made vice-admiral. In his book *The Victory at Sea* (1920), in conjunction with Burton J. Hendrick, he shows how the convoy system, used in transporting 2,000,000 American troops, frustrated the submarines. On conclusion of the War he relinquished command of the fleet, and in Feb. 1919 resumed his position as president of the Naval War College. In 1919 he criticised the manner in which naval honours had been awarded. He received the G.C.M.G. from King George V. in 1918. In 1920 he made a formal report to the U.S. Senate, charging the U.S. Naval Board with serious errors in the conduct of naval operations during the War.

**SINGAPORE** (see 25.147).—A hundred years ago, Singapore was no more than an insignificant fishing village built on piles on the outskirts of a tropical forest. To-day it is one of the world's greatest ports, with a population of 457,000, and is the capital of the Crown Colony, the Straits Settlements. Its amazing growth is due to three causes, so closely interdependent that no one of them would have been effective without the other two. First must be put its geographical position on the island of the same name which lies at the southern extremity of the Malay Peninsula (1° 20' N.—103° 50' E.); secondly, British enterprise; thirdly, Chinese business capacity and efficient labour. Strategically and commercially it occupies a unique position. It is a

natural gateway through which must pass all the vast traffic on its way from Europe to China and Japan, and upon which converge the great ocean routes connecting India with the Dutch East Indies, Australia and the Far East.

With its great advantages Singapore is able to cover expenses without either income tax or death duties; but nearly one half of the revenue is derived from opium. By treaty the Straits Settlements may be called upon to pay 20% of their revenue towards the upkeep of the military establishment maintained for defence, but for many years past the cost has never been more than about two-thirds of that sum. The main defences and the artillery barracks are at present on the island of Blakan Mati; the royal engineers are on a smaller island, Pulau Brani, on which also stand the largest tin-smelting works in existence; the infantry are stationed at Tanjong on the main island.

*The War Situation.*—At the outbreak of War in 1914 the British battalion which forms the backbone of the garrison was withdrawn for active service elsewhere, and the protection of the island was entrusted to Indian troops, who were not altogether well affected. A large number of German civilians were placed in an internment camp, and there is reason to believe that some communication passed between the prisoners and the troops. A dangerous mutiny broke out in 1915. The Indian troops shot several of their officers, and many other Europeans were killed. For several days the situation was extremely critical, and all women and children were removed from their houses to ships in the harbour. In the absence of regular troops the mutiny was suppressed by local volunteers (by no means all of whom were familiar with the use of arms), who received great assistance from H.M.S. "Cadmus" and from H.H. the Sultan of Johore. French, Japanese and Russian ships hurried to the spot, but by the time they arrived serious trouble was at an end. With this exception the years 1914 to 1918 may be said to have been uneventful in comparison with the terrible experiences in Europe and elsewhere; but so soon as hostilities ceased and the German fleet had surrendered, the military importance of Singapore underwent a remarkable change.

*Singapore as a Naval Base.*—Properly to understand this change, it is necessary to go back to the Russo-Japanese War, and to remember that the destruction of the Russian Fleet in the battle of the Sea of Japan completely altered the balance of sea-power in the Far East. Up to that moment it had been necessary for Great Britain to maintain a considerable naval force in the China seas, but so soon as the supremacy of the Japanese was unchallenged every available ship was brought back to the North Sea, where the German menace was already making itself felt, and our eastern interests were confided to our Ally. These conditions underwent another complete alteration when the German Fleet had been safely escorted to Scapa Flow. On the one hand all danger had been removed from European waters, while on the other hand our commitments in the East had grown.

It was no longer right, or indeed possible, to ask others to shoulder responsibilities which were our own, and it was argued that we must ourselves be in a position to safeguard our vast trade with China and Japan, as well as with Australia and New Zealand. This could not be done without a base in the Far East, and the choice evidently lay between Hongkong and Singapore. Hongkong had many advantages, but it was somewhat isolated and distant from possible support in India; moreover, a naval fortress there might be taken as provocative and a direct threat to Japan and China. Singapore, on the other hand, provided adequate facilities, and as it was not less than 3,500 m. from Tokyo the establishment of a naval base there could be represented as a reasonable precaution and not as a hostile decision. This decision was followed soon afterwards by the naval conference at Washington (g.v.), when the Anglo-Japanese alliance was replaced by the Four-Power Pact. England, as part of her contribution towards peace, bound herself to undertake no new fortification east of 110° of latitude. Hongkong was thus definitely ruled out, and the decision to establish the base at Singapore was almost immediately made public.

Opponents of this decision have declared that it is an infringement of the spirit of the Washington conference, but for this allegation there are no grounds whatever. Great Britain's intention was well known both to America and Japan. Other objections which have been raised are that we are threatening our former Ally, and that Great Britain cannot afford the expense entailed. The former objection has already been answered; with regard to the second it can only be said that security cannot be measured in terms of pounds, shillings and pence. A more serious objection is that Malaya and the Straits, with all their wealth, provide none of the real necessities of life. Everything is imported: meat from Australia, vegetables from Java, rice from Siam, Burma and China, milk in tins from Switzerland. With a large Asiatic population this is a serious consideration; but if we can safeguard our trade routes we can equally safeguard our own supplies. The Singapore base is now an established fact in British Imperial strategy. The Government of the Straits Settlements have made a free gift of the necessary land, and many of the Dominions and Colonies have contributed, or promised to contribute, towards the expense of construction. Its Imperial significance could not receive more sincere or more practical acknowledgment.

**SINGING.**—In singing and speaking, the voice is produced by the action of breath on the vocal cords, the vibrations of which are transmitted to the air passing upward between them. These vibrations are developed in volume and quantity in the resonating cavities above.

It is generally conceded the world standard of vocal technique in the 20th century is lower than formerly, and considerably lower than that which prevailed in Italy 150 years ago. Various reasons are advanced for this, the absence of standardised theories and methods of teaching, excessive emphasis laid upon physical phenomena and physiological details in the education of singers, the demand for artistic rather than vocal excellence in public performances, the amount of vocal music now written that is not skilfully adapted for the voice, and the unwillingness or inability of singers to give sufficient time to their period of study before launching upon a professional career. Those interested will find the subject discussed in one of the lectures published in Hahn's book, which, however, has, up to the time of writing, not been published in English.

## I. THE MECHANISM OF SINGING

**Vocal Cords and Larynx.**—That the vocal cords do not invariably vibrate throughout their breadth in the same manner has been shown by the experiments of Oertel, Koschlakoff and Simanowski. Further evidence of this has been obtained by Curtis, who has experimented with an improved model of Oertel's stroboscope, and has proved that in the lower or chest register of the voice, the vocal cords vibrate throughout their entire length, and throughout their entire breadth in a manner which increases the extent of the excursion of individual points as their distance increases from the fixed border of the cords. The vibrations of the two cords are synchronous, and the extent of oscillation considerable. When a note of higher pitch is sung, an increase in length and a decrease in breadth in the cords is noticeable.

In the upper register the cords are again seen vibrating throughout their entire length and entire breadth, but the characteristics of the movements are different. The cords are flatter and have thinner edges, and are divided into segments which have their own rate of vibration. The division in each cord is characterised by a faint nodal line, marking off a narrow zone comparatively close to the free border, and this nodal line divides the cord in its breadth into two unequal segments, that

nearest the free edge taking up three-quarters of the width, and vibrating freely; and the inner, smaller segment vibrating to a much smaller extent. It has been noticed that the vibrating cords have also on their free edges nodal points in their length, the membrane dividing into separate vibrating segments.

Considerable experiments have been made to determine the functions of the ventricles of the larynx. Working on the similarity (observed by Savart) of the human larynx to the metal decoy-bird of the sportsman (see fig. 1), Baratoux maintains that the ventricles fulfil exactly the conditions found in that instrument.

The experiments of Lootens, who discovered the cyclones (which bear his name) existing in tubes made to sound by means of an air current, confirmed by Van Tricht, of Namur, are quoted. These cyclones in the decoy-bird followed a circular course on either side of the cavity, and by variation in breath pressure alone a variation in pitch of two octaves was produced by Savart. In like manner it is claimed by Baratoux that the ventricles of the larynx are inflated and that similar cyclones occur within them, causing regular variations of air pressure, which by their pulsation produce vocal tone.

**Registers.**—The practice of dividing the voice into three registers is still followed by the majority of musical writers on singing. William Shakespeare, *Plain Words on Singing* (1924), illustrates this with a plate showing the appearance of the vocal cords in chest, medium and head registers. On the other hand laryngologists tend to reduce the number of registers to two, at least so far as mechanical changes in the larynx itself are concerned (Curtis, Moure and Bouyer, Baratoux). The medium register is by some of the latter regarded as a species of *voce mista*, including characteristics of registers above and below it.

**Attack.**—The subject of attack in both song and speech has received much attention. The evil of the "click" type or *coup de glotte* has been demonstrated by anatomist, physician and singing master (Hulbert, Aiken, Dodds and Lickley), and agreement seems to have been reached that physically, functionally and vocally the most desirable method is that of the simultaneous action of vocal cords and expiratory muscles, whether for singing or speaking.

**Vowel Tones.**—The division of the resonance of the voice into tone resonance and vowel resonance has been further demonstrated by the researches of Aiken, and also by Sir Richard Paget. The latter has shown, by experiment in public, that it is possible to construct an apparatus which, fitted with a bellows and reed to obtain tone, can be attached to resonating cavities of various kinds which will add vowels to the sounds already produced by the reed, and by using the hands to produce simple

FIG. 2.—Series of tongue vowels and their resonating pitch in each resonator.

consonants like "l" to obtain as a composite result words or even short phrases (see VOICE SOUNDS). Aiken has experimented extensively with whispered vowels, and states that the two principal vocal resonators are the neck cavity, for tone resonance, and the mouth, for vowel resonance. He therefore regards singing and speech as a combination of two instruments. His series of tongue vowels and their resonating pitch in each resonator is given, in its simplest form, in fig. 2.

The upper note gives the mouth resonance pitch, and the lower the neck resonance pitch, of the vowel printed below. He also gives a list of 12 English vowels with similar resonance pitches for women and men (see fig. 3).

The average pitch of men is a minor third lower than that of women, beginning on the note F, first space treble clef.

Aiken has worked out on this basis a very extensive list of whispered resonances, showing the pitch of the possible har-

FIG. 1.—Section of a decoy-bird.

FIG. 3.—List of 12 English vowels with similar resonance pitches for women and men.

monics to be obtained on the simple vowels *oo*, *aw*, *oh*, *eh* and *ee* when sung on each note within a compass of two octaves of the chromatic scale. He claims, therefore, that the singer is playing upon two instruments, one producing notes in obedience to mental perception, the other producing an entirely independent series of vibrations, resulting in articulate speech. The second can perform all its functions, though feebly, in a whispered voice alone, but when assisted by the vibrating note of the first, its influence is much greater. He states that in singing practice "this separation of the two regions in which the conscious activity of each instrument must be definitely realised is one of the fundamental principles of the use and development of the voice, and is absolutely in accord with the physical and physiological distinctions between the two instruments."

On this subject some practical work has also been done by W. S. Drew, who, acting upon the arguments given by D. C. Miller in *The Science of Musical Sounds*, applies the theory of vowel resonance to tone production, and states that the vowel resonator can be tuned to amplify the note which is being sung.

If the resonance region which gives the characteristic sound to a vowel is high up in the scale, there should be no difficulty, for men's voices at least, in singing that vowel throughout the compass; if the characteristic resonance is low there will be found notes, or regions of notes, where it will be difficult to make the vowel sound quite "natural."

He also states that so long as the harmonic which gives the characteristic sound to the vowel is present, the other harmonics may be modified in many ways to give varieties of tone quality, but if the characteristic vowel harmonic is lost then the modification of the pronunciation is apparent, and the vowel itself is heard to have changed.

## II. SINGING IN GREAT BRITAIN

*Improved Standards.*—The development of the musical aspect of song in Great Britain during the first quarter of the 20th century has been greater than in any similar period since the 17th century. In schools, homes, and at so-called "popular" concerts the older type of popular ballad is gradually being superseded by a better type of song in which a lyric of poetic beauty is set to music bearing real art value. Many causes have contributed to this. The work of Parry, Stanford, Mackenzie, and to some extent of Sullivan, has kept the stream of British music flowing, and latterly, the influence of Elgar, though stronger orchestrally and chorally than in song, has been a great factor in national progress. Another factor is the rise, largely through the teaching of Corder at the Royal Academy of Music, and of Stanford at the Royal College of Music, of a school of British composers, who in song are today producing works which at least equal anything that is being produced abroad. Among the best of these are Granville Bantock, Arnold Bax, Arthur Bliss, Rutland Boughton, Frank Bridge, George Butterworth, Thomas Dunhill, Ernest Farrar, Armstrong Gibbs, Hamilton Harty, Gustav Holst, Joseph Holbrooke, John Ireland, Roger Quilter, Cyril Scott, Martin Shaw, Arthur Somervell, S. Coleridge-Taylor, "Peter Warlock" and Ralph Vaughan Williams. It is to be noted also that the World War had a marked effect by turning the attention of the nation to British musical art, and giving more opportunities for the performance of native works. Owing to the increased demand for copies, music publishers had a greater inducement to speculate in the production of the works of British composers.

Lastly, British composers have undoubtedly added to their popularity by adopting to a much greater extent a musical idiom in composition which is founded upon national models,

particularly of the Tudor and Elizabethan composers, instead of following the trend of foreign musical taste or development.

*Unaccompanied Song.*—The most primitive type of song was of course unaccompanied, and some composers have written songs of this type, but with all the freedom of the modern idiom in musical line, rhythm and chromaticism. It is claimed that in modern songs with orchestral accompaniment the human voice is associated with a volume of instrumental tone which overwhelms it; and that, though simplicity for its own sake is not desirable, in songs for voice alone a vehicle for expression is found that is, vocally, more complete; and that, as an artist can express himself in a line drawing and omit nothing that is essential, so a composer may, by the vehicle of the voice, express in song all that is contained in the poet's lyric, and the composer's reflection of his own mental and temperamental counterpart of it in music. Unaccompanied songs have been composed by Herbert Bedford, Cyril Scott, Gerrard Williams, Frederick Austin, Felix White, Jane Joseph, George Oldroyd, Harry Farjeon, Francesca Hall, Eugene Bonner, Liza Lehmann and John Tobin, and a list of 39 is given in Herbert Bedford's book. It is claimed that not only is the poet better served but that the composer and singer alike are freer in their possibilities of expression, and that the audience can be stimulated to an alertness of imagination similar to that required when witnessing a stage play produced without scenery.

*Lutenist Songs.*—For many years the wealth of song to lute accompaniment contained in the forgotten resources of the British Museum and elsewhere was known to few musicians, and but for some enthusiasts would probably have remained unknown. Thanks to the efforts of Frederick Keel, Philip Wilson, "Peter Warlock" and, most of all, Canon Edmund H. Fellowes, we are becoming familiar with a national heritage of song which is having a strong influence on our musical taste and upon our composers. The English school of lutenist song-writers began in 1597 with the publication of John Dowland's first volume of airs and ended with his *Pilgrim's Solace* (1612), save for one volume of songs by John Attey, published in 1622.

Besides Dowland, who published four books of songs, the principal composers were Thomas Campion (five books), Robert Jones (five books), Thomas Morley, Phillip Rosseter, Thomas Ford, William Corkine and Francis Pilkington, and their combined work produced about 30 books of songs. Each book contained 20 or 21 numbers, and comprised a voice part with accompaniment in lute tablature or notation. A large number of songs were also alternatively arranged for unaccompanied part-singing by four performers. Fellowes states in his preface to the first volume of the reprint of Dowland's airs, "We have in this collection of volumes a rich store of national song, the music of which is wedded to superb verse belonging to the finest period in national literature." The songs are in free rhythm, without time signatures, and, although barred, are quite irregular in time, the accents varying in accordance with the rhythm of the words. The manner is one which is once more being adopted by modern composers, and may be found in some of the songs of Holst, Vaughan Williams, "Warlock" and others, save that in most cases these adhere to time signatures, and change them as often as they desire. In their harmonised forms the lutenist songs resembled more the modern part-song than the contrapuntally written madrigal with which it was contemporary. It is probable that the increasing popularity of the spinet and virginal was responsible for the brevity of the life of the English lutenist school. The lute was much more difficult to play than any keyboard instrument, and though

songs were published with accompaniments for the lute until the end of the 17th century its use was almost confined to the work of professional experts. The rise of the popularity of the violin also detracted from that of the lute.

**Folk-songs.**—The active interest in English folk-song dates only from the last quarter of the 19th century. Previous to this, collections of Irish, Welsh and Scottish songs had been gathered and published, also W. Chappell's *National English Airs* which appeared in 1840, but until the work of Child, Baring Gould, Frank Kidson and one or two other pioneers drew attention to the beauty of their discoveries, little was known of the folk-music of the English people. There are at present folk-song societies in England, Scotland, Wales and Ireland, though in Scotland a central body has not yet been established, and the work of collection and publication is in the hands of various local societies. Work of great value has been done in England by Cecil Sharp, who devoted his life to folk-song and folk-dancing, R. Vaughan Williams, Frederick Keel, George Butterworth, Lucy Broadwood, H. Fleetwood Sheppard, J. A. Fuller-Maitland, Charles L. Marston and W. G. Whittaker. The recent publication of *Songs of the Hebrides* by M. Kennedy-Fraser and Kenneth Macleod has added yet another and distinctive type, and the arrangements of Irish airs by Herbert Hughes have popularised afresh the national airs of Ireland, though the popularity of these was already assured by the editions of Stanford and research work of W. H. Grattan Flood. A collection of Welsh songs, edited by J. Lloyd Williams and Arthur Somervell, is also a valuable contribution to these publications, as is the work of Sir Richard Terry, whose collection of *Sea Chanties* is already well known.

British composers have of recent years gone increasingly to the folk-song for their pattern and inspiration, either basing their melodies on the style of the folk-song, or using the folk-melodies in their works, as in Rutland Boughton's lyrical drama *Bethlehem* and Gustav Holst's opera *The Boar's Head*. In the collection of the words of *English and Scottish Ballads* the work of Francis J. Child must be noted. From 1882-98 he published five volumes, containing 305 distinct ballads, some with as many as from 10 to 28 variants, with the history and bibliography of each, an index of ballad airs and a collection of tunes.

### III. SINGING IN THE UNITED STATES

In many directions vocal music in the United States has made great progress since 1910. The scientific side of singing has been assiduously studied by both laryngologists and singing masters, and many volumes on the subject have been published, notably by Curtis, Herman, Miller, Shaw, etc. The result has been a steady improvement in the general standard of voice production and cultivation. The attention paid to vocal tuition in schools and colleges throughout the country testifies to an increased recognition of the importance of music as a factor in education. As in Great Britain, there has been an active interest in folk-song. Indian, negro, American-English, American-Hungarian and other varieties of folk-melodies have been collected, and have been used by American composers, as, for example, in the orchestral compositions of Henry F. Gilbert, wherein are employed both Indian and negro melodies, Daniel G. Mason's string quartet and John Powell's "Rhapsodie Nègre," which are both based on negro themes, and Griffes' "Two Sketches" for string quartet, based on Indian themes.

Interest in opera is undoubtedly growing. The American Opera Society of Chicago publishes a list of 60 American composers of opera, though less than a dozen of their 90 works survived a first performance. A recent statement has been made (March 1926) that there are 24 grand opera companies touring the United States, besides those more or less permanently established in New York and Chicago. Public support of opera is lavish, and new works have opportunities for presentation probably equal to any in Europe, and, though a national school of opera is still in the future, the way is being paved for further talent and enterprise in this direction. German, Italian and Russian opera still hold popular taste to a great extent.

**Vocal Composers.**—Edward MacDowell, Arthur Foote, George W. Chadwick and Horatio Parker have been termed the "Big Four" of American composers. Their work enjoys international appreciation, and though it cannot be said, even yet, that their musical successors have succeeded in establishing a definite American school of composition, it is undoubtedly true that to-day (1926) there exists a coterie of song composers who are producing works which are of definite value in musical progress, not only in the United States, but internationally. It is unfortunately also true that more bad music, vocal and instrumental, is produced and sold in the United States than in any other country, the taste for jazz and other "best-sellers" being even greater than in Great Britain; but the amount of good music being produced, circulated and taught is growing rapidly, and the songs and vocal works of such composers as the following can be cited as evidence of what is best in American song at the present time: Charles W. Cadman (operas, cantatas, songs), John A. Carpenter (songs), Frederick S. Converse (operas, songs), John Densmore (songs), Henry F. Gilbert (songs), Rubin Goldmark (songs), Charles T. Griffes (songs), Henry Hadley (operas, cantatas, 150 songs), Richard Hageman (songs), Henry H. Huss (cantatas, songs), Edgar S. Kelley (operas, miracle play, songs), Charles M. Loeffler (cantatas, songs), Daniel G. Mason (songs), John Powell (songs), Ernest Schelling (songs), David S. Smith (cantata, anthems, part-songs), Emerson Whithorne (songs). (See also CHORAL SINGING; VOICE SOUNDS.)

**BIBLIOGRAPHY.**—Mechanical Action, Registers, Attack, Vowel tones: E. J. Moure and A. Bouyer, *Fils, The Abuse of the Voice*, translated by Macleod Yearsley (1910); W. A. Aiken, *The Voice* (1910); H. Holbrook Curtis, *Voice Building and Tone Placing* (1909); Reynaldo Hahn, *Du Chant* (1920); H. H. Hulbert, *Eurhythm* (1921); W. S. Drew, *Voice Training* (1923); William Shakespeare, *Plain Words on Singing* (1924); J. Baratoux, *The Voice* (1925); George Dods and J. Dunlop Lickley, *The Control of the Breath* (1925); *How Human Speech is Produced*, Lecture by Sir Richard A. S. Paget (Tyneside Sunday Lecture Society, Nov. 22 1925). Songs: A. Eaglefield Hull, *Dictionary of Modern Musicians* (1924); Ralph Dunstan, *Cyclopaedic Dictionary of Music* (1925). Herbert Bedford, *Modern Unaccompanied Song* (1923). Lutenist Songs: Edmund H. Fellowes, *English Madrigal Composers* (1921); Edmund H. Fellowes, *First Book of Airs* (John Dowland) (1920); Jeffrey Pulver, *Dictionary of Old English Music and Musical Instruments* (1923). Folk-songs: W. Chappell, *National English Airs* (1840); F. J. Child, *English and Scottish Ballads* (1904); Cecil J. Sharp, *English Folk-Song, Some Conclusions* (1907). Books on the Artistic Aspect of Singing: David Ffrangcon-Davies, *The Singing of the Future* (1905); H. Plunkett Greene, *Interpretation in Song* (1912); Herman Klein, *The Bel Canto*, with particular reference to the singing of Mozart (1923); Dawson Freer, *The Teaching of Interpretation in Song* (1924); H. Gregory Hast, *The Singer's Art* (1925). United States: A. Eaglefield Hull, *Dictionary of Modern Music and Musicians* (1924); Laurence Gilman, *Nature in Music* (1915); R. L. Herman, *An open door of singers* (1912); Frank E. Miller, *The Voice* (1910); W. Warren Shaw, *The Lost Vocal Art* (1914); Mathews, *A hundred years of music in America*; Ritter, *Music in America*; O. G. Sonneck, *Survey of music in America*; B. M. Steigman, *The great American Opera* (Music and Letters Oct. 1925). From the *Musical Quarterly*: Henry F. Gilbert, *The American Composer* (April 1915); Herbert F. Small, *On Opera* (Jan. 1918); Daniel G. Mason, *Folk-song and American Music* (April 1918); John T. Howard, Jr., *Our Folk-music and its probable impress on American music of the future* (April 1921); O. G. Sonneck, *The American Composer and the American Publisher* (Jan. 1923). **SINHA, SATYENDRA PRASSANO**, 1ST BARON OF RAIPUR (1864- ), Indian statesman, was born of an ancient Kayastha family in the village of Raipur, Birbhum district, Bengal, in June 1864. From the Presidency College, Calcutta, he went to London in 1881 to join Lincoln's Inn, where he won many prizes and scholarships, and was called to the Bar in 1886. He was the first Indian to be appointed advocate-general of Bengal (1908), and the first to become a member of the Government of India. He held the law portfolio from April 1909 to Nov. 1920. He then resumed his lucrative practice at the Bar, and presided at the Indian National Congress session at Bombay in 1915. He and the Maharaja of Bikaner were the first Indians to participate in Empire deliberations in London, for in 1917 they jointly assisted the secretary of state at the meetings of the

Imperial War Cabinet, and were members of the Imperial War Conference. Sinha joined the Bengal executive council in the same year, but returned to England in 1918 as a member of the Imperial War Cabinet and Imperial War Conference, subsequently becoming a representative of India at the Peace Conference.

Knighted in 1914, in 1918 he was made K.C., a distinction not previously conferred upon a barrister of Indian birth or practice. At the beginning of 1919 he established further records for an Indian by being appointed to the Ministry as under-secretary for India, and being raised to the peerage as Baron Sinha of Raipur. He was the second Indian to be sworn of the privy council. He skilfully conducted the Government of India Act, 1919, through the House of Lords, and at the close of 1920 was appointed governor of Bihar and Orissa, being the first Indian to preside over a British province. Ill-health prevented him from serving his full term in that office, and in 1921 he resigned.

**SKEAT, WALTER WILLIAM** (1835-1912), British author (see 25.168), died at Cambridge Oct. 7 1912.

**SKIN DISEASES** (see 25.190).—Since 1910 our knowledge of skin diseases has been advanced by the discovery of the cause of certain affections, by the addition of new methods of treatment and by the recognition of new entities.

**Classification.**—The classification of skin diseases, at first based on naked-eye appearances, and, later, on the underlying pathological changes, is becoming simplified by the adoption of an etiological basis, and, as our knowledge of their causation becomes more complete, such an ideal becomes possible, and is being attempted in the more recent text-books. At the present time, however, the cause of certain skin diseases remains obscure, but, as the gaps in our knowledge become gradually filled in, the group of the unclassified affections becomes correspondingly diminished. With the improvement in classification, the nomenclature also has become more rational and etiological. In the early descriptive period it was complicated by an attempt to divide cutaneous diseases into hard and fast varieties, usually designated by "dog-Latin" adjectives, such as *Eczema erythematosum*, *E. papulosum*, *E. vesiculosum*, etc.; by an effort to indicate the disease by some compound name, suggesting its essential characteristics, such as *Erythema multiforme exudativum*; or, still worse, by the disease being named after him who claimed to have first described it. It has now been simplified by the realisation that certain skin affections, believed in the past to be diseases *per se*, are only variants of a common pathological process, modified by individual peculiarities or situation, and, by making it etiological, as in such names as *blastomycetic dermatitis*—a disease due to a yeast—or *Tuberculosis cutis*—skin lesions caused by the presence of the tubercle bacillus in situ.

Of the new forms of skin disease which have been recognised in recent years, the most numerous have been those occurring in tropical countries, and of them a considerable number are due to fungi, and constitute the group of the tropical dermatomycoses. In Great Britain the cutaneous lesions associated with diseases of the blood have been the subject of careful study, especially those which occur in connection with the leukaemias and lymphadenoma.

**Ringworm.**—It is now established that the disease, popularly known as ringworm, is due to a number of mould-fungi, which vary in different climates and countries, like other members of the vegetable kingdom, and which have a wide distribution in the animal kingdom, occasionally even in birds, from which they are capable of being transmitted readily to man. Certain resistant forms of dermatitis, affecting various parts of the body, but more especially the groins and the extremities, which may closely resemble eczema, are not variants of that protean disease, but the result of the presence in the skin of certain ringworm fungi. This type of ringworm has increased since the World War, as it was common among the troops, especially those who went through the Gallipoli campaign, or served in the East, and was brought home and spread by them.

**Eczema.**—Eczema, the commonest of skin affections, is no longer regarded as a disease due to a single cause, but as a form of cutaneous reaction, due to a variety of irritants, acting either locally, from without, or circulating in the blood, possibly in an

individual predisposed by some lowered resistance. In the group of the eczemas it is customary now to include the various forms of occupational dermatitis. These are attracting attention, as they are responsible for considerable disablement. The list of irritants, chemical and physical, which may cause them, is continually being extended, and the problem of their prevention is receiving the close attention of the Public Health Authorities (see INDUSTRIAL WELFARE).

**Actinic Action.**—The actinic rays of light have been shown to be an important factor in causing inflammation of the skin. For years it has been known that they are responsible for the peculiar eruption of the face and hands which recurs in summer in individuals sensitive to light (*Hydroa aestivale*), and for the more serious freckled affection which goes on to cutaneous cancer (*Xeroderma pigmentosum*). It is only recently, however, that the peculiar, dry, atrophic, freckled condition of the skin, dotted over with dilated capillaries, and horny thickenings which may become malignant, has been shown to be due to the sun's rays. This is met with on the unprotected parts, namely the arms, hands and face, of people long exposed to the sun, in countries where its rays are intense, such as India, South Africa, Australia, etc.; it is now designated as chronic solar dermatitis, and corresponds closely to a chronic burn from the X-rays.

**Microbial Action.**—The rôle of micro-organisms and parasites in causing skin disease is being more appreciated. Bacteria (see BACTERIOLOGY) have been shown to be the cause, not only of the common forms of septic impetigo, but of a variety of scaly affections, previously regarded as forms of eczema, which are now included under the heading of Dermo-épidermites microbiennes. Ultra-microscopic organisms, capable of passing through a Berkefeld filter, which have become prominent lately in connection with cancer (see CANCER; FILTER-PASSING MICROBES), would seem to be responsible for the small epidermal growths, known as *Molluscum contagiosum*, and it is more than probable that similar organisms will be found to be the cause of other types of benign and malignant epithelial growths. In the Tropics, the so-called Calabar swellings have been found to be of filarial origin, and the Oriental sore to be due to a parasite of the trypanosome family.

**Focal Infection.**—Focal infection, in the sense of protein poisoning from bacteria in some crypt or tissue, or in the alimentary tract, has of late years been advanced as a possible cause of *Lupus erythematosus*, circumscribed patches of eczema, and other erythematous conditions, and the improvement in them which sometimes follows the injection of an autogenous vaccine has been taken as evidence of an etiological connection.

**Nervous System.**—Although certain affections of the skin, such as *Herpes zoster*, or shingles, have been proved to be of nervous origin, the trend of recent research has gone to show that the influence of the nervous system as a cause of cutaneous disease has been overrated, and that a number of affections, which were vaguely attributed to reflex nervous disturbances, are either of toxic origin, or due to imperfect action of a ductless gland, or to some disordered state of the blood.

**Anaphylaxis.**—The doctrine of anaphylaxis (which means the state of hyper-sensitiveness occurring when the organism has reacted to some toxin or irritant and reacts more acutely to a second dose of the same toxin), has contributed to our knowledge of certain cutaneous phenomena, and has explained the liability to recur of a dermatitis due to local irritation, or to the presence in the blood of some foreign protein.

**Therapeutics.**—The advances in treatment have been remarkable. Internal treatment has become based more on general medical principles and on the discovery and correction of some underlying disturbance in an organ or system than on so-called specific medication. That sheet-anchor of the earlier physicians—arsenic—has lost its position as a panacea for chronic skin affections, and any value it may have in the treatment of psoriasis, pemphigus, etc. is being regarded more as the result of its value as a nerve tonic than as a specific drug. It has attained, however, a new importance in its organic preparations, in the treatment of syphilis (see VENEREAL DISEASE).

**Organo-therapy.**—The increase in our knowledge of the ductless glands (see ENDOCRINOLOGY) has added organo-therapy to our methods of treatment, and thyroid medication has proved to be of benefit in various skin affections in childhood, associated with retarded development, and especially in mild ichthyosis, in which eczematous changes are so liable to be superimposed.

**Vaccine Therapy.**—The value of vaccines (see VACCINE THERAPY) in the treatment of skin diseases has been overrated, and their use in the past was too promiscuous. They are of most value in acute suppurating lesions of staphylococcic origin, such as recent boils. The development in local treatment has been even more striking than that from internal medication.

**Refrigeration; Diathermy.**—Refrigeration, with carbon dioxide as the freezing agent, has become established as a useful means of destroying vascular naevi, moles, warts, superficial rodent ulcers, and of ameliorating Lupus erythematosus of the fixed type. Diathermy has proved of great value in inoperative cases of rodent ulcer, and for cauterisation of malignant growths in the mouth of naso-pharynx (see ELECTRO-THERAPY).

**Radiotherapy.**—The greatest advances, however, have taken place in connection with radiotherapeutics (see RÖNTGENOLOGY). The newer methods of X-ray dosage, made possible by the use of the Coolidge tube, has increased the usefulness of the X-rays as a means of healing chronic ulcers, relieving local irritations, reducing epidermal thickening and causing the defluvium of the hair for the cure of ringworm of the scalp. Radium has proved to be of special service in the treatment of rodent ulcers and hypertrophic scars (see RADIUM). The value of the actinic rays of light, when applied locally, in the treatment of tuberculosis of the skin, and in healing chronic ulcers, has been greatly enhanced by its use over the whole cutaneous surface, in the form of actinic ray baths, which have been found to improve the general health by stimulating metabolism and increasing the bactericidal power of the blood. See HELIO-THERAPY.

**SKRZYNSKI, ALEXANDER, COUNT** (1882– ), Polish statesman, was born at Zagorzany, Galicia. Educated at Cracow and Munich, he entered the diplomatic service in 1906 and was appointed secretary to the ambassador to the Holy See in 1910. When the World War broke out he was secretary to the Austro-Hungarian Ambassador in Paris. After a short military service at the beginning of the War, he completed his studies for the Bar, receiving the degree of Doctor of the Law at the University of Vienna. When the new Polish State was established, he was appointed Polish Minister Plenipotentiary at Bucharest, and later succeeded in concluding a Polish-Rumanian political treaty in 1921. In Dec. 1922, after the murder of Narutowicz, the first international President of the Republic, Skrzynski became Minister of Foreign Affairs. He threw himself energetically into the task of settling all open questions, inaugurated a pacific policy based on the final stabilisation of frontiers and gained the necessary confidence of the Powers. When a Cabinet of the Right was formed in May 1923, Skrzynski thereby lost office, and he was appointed in the following month Polish delegate to the League of Nations. In Aug. 1924 he again accepted the portfolio of Minister of Foreign Affairs in the Grabski Cabinet.

By a number of conventions, the regulation of the British and American debts, the concordat with the Vatican, the rapprochement with Czechoslovakia, Skrzynski strengthened Poland's international position, taking an active part in the League of Nations in elaborating the scheme for the Geneva Protocol and in securing settlement of the Danzig disputes in a manner favourable to Poland. He tried to disarm the suspicions of Moscow as to the new configuration of Europe by receiving Chicherin at Warsaw (Sept. 1924). In the negotiations in connection with the German proposals with regard to the Locarno Pact (1925), Skrzynski sought to reconcile Polish interests with the general scheme of the conference, and signed an arbitration agreement with Germany and also a convention with France in

accordance therewith. After the fall of Grabski's Government Nov. 13 1925 Skrzynski was entrusted with the formation of a government by Wojciechowski, the President of the Republic, and with the participation of the Socialists formed a coalition cabinet in which he himself was Prime Minister and Minister of Foreign Affairs. In May 1926, however, the Socialists seceded from the Cabinet. Skrzynski considered that the Coalition rested on too narrow a basis, and therefore resigned the Premiership. See also POLAND.

**SLAVERY AND FORCED LABOUR** (see 25.216).—Before the first decade of the 20th century was past, a more or less settled administration had been established throughout Africa under European control, except in Abyssinia and Liberia. forcible seizures and even small raids on frontiers not yet under effective control, especially on the borders of the Sahara, still occurred from time to time, and slave-dealing still surreptitiously existed, but these were dealt with as ordinary crime. Effective administration of the territories controlled by the Great Powers was maintained throughout the World War, and in the world settlement which followed a fresh convention was concluded at St. Germain in 1919, in which the signatories pledged themselves to suppress "slavery in all its forms"—a new and very significant formula.

**The New Convention.**—This convention superseded the Berlin and Brussels Acts so far as its signatories (the Allies in the War) were concerned, and it seemed doubtful to what extent those Acts remained operative. The new convention, like its predecessors, dealt with many subjects: navigation of rivers, freedom of trade, etc. The liquor traffic and the arms traffic were, however, dealt with in separate conventions, while slavery and the slave trade occupied but a single clause in the convention.

**Enquiry by the League of Nations.**—The admission of Abyssinia to membership of the League in Sept. 1923—a country in which slavery still remained a legal institution, and in which slave-raiding and the slave trade had until recently been carried on, and were alleged to be still existing—was the proximate cause of the revival of the question as a subject of international concern. The League of Nations appointed a committee to investigate the subject. It met in session in July 1924, and again in the following year. It recommended *inter alia* a new convention, to which the adherence of all States, whether members of the League or not, should be invited. This proposal was accepted, and the British Government submitted a draft convention. All States members of the League, and also Afghanistan, Ecuador, Egypt, Germany, Mexico, the Sudan, Turkey and the United States were invited

to send to the secretary-general not later than June 1926 any observations they might desire to make regarding its provisions . . . and to assist one another forthwith in the abolition of the slave trade, slavery and conditions analogous thereto by all practicable means.

These "analogous conditions," says the official report, "are intended to include all forms of debt slavery—the enslaving of persons disguised as the adoption of children and the acquisition of girls by purchase disguised as payment of dowry, etc." The convention purports to represent the highest minimum standard to which it was anticipated that general acceptance could be secured, but "it is hoped that no States will be satisfied with compliance with the minimum standard which is now proposed."

**Domestic Slavery.**—In regard to domestic slavery and serfdom a larger experience has led to recognition that among primitive tribes, and also among communities which have adopted the Moslem faith, or a Christianity (as in Abyssinia) based on the law of the Pentateuch, the institution has become so intimately interwoven with the social fabric that sudden and enforced emancipation would bring ruin and misery to the slaves no less than to their owners. In such cases, therefore, absolute prohibition of the acquisition of new slaves, and of all dealing in slaves, combined with the abolition of the legal status—so that no court of law can recognise any rights based on the claim of property in the person of another—is the preferable method. This gives to every slave the right to assert his freedom without any

ransom or formality, but does not make it a crime for a master to retain a slave if both desire to remain in that relationship. It is *permissive* as contrasted with *compulsory* freedom.

**Forced Labour.**—The convention "deals for the first time in international agreements with the question of forced labour," which may be viewed from two standpoints. There is probably a consensus of opinion that in certain cases a State may find itself under the necessity of compelling labour for essential public works or services. There is also probably a predominant opinion that such labour should be fairly remunerated, though some hold the view that if compulsory labour is imposed under the guise of a tax—as a fiscal measure—it need not be restricted to urgent public services, and of course would not be remunerated,—as the Central African mandates require. The second principle to be determined is whether it is permissible in any circumstances to use compulsion for the supply of labour, even though paid, in enterprises conducted for private profit. Abuses of the system known in South America as "peonage" fall under this category, by which labourers become involved in debt which they can never repay, and so become slaves for life. The Slavery Commission pointed out that this system merits particular condemnation when an alien employer deliberately adopts measures to secure by such means the life-long servitude of an ignorant and unsuspecting peasantry.

From this brief outline it is evident that the standards and aspirations of to-day show a fuller appreciation of the true interests of the backward races than was possible a couple of decades ago, and a conscientious desire to deal with them by liberal and practical methods.

**SLEEPING SICKNESS** (see 25.240c).—At the International Conference held in London in June 1907 nine problems were stated for future solution. Some of these have been completely, others partly, solved (1) and (2).<sup>1</sup>

**Transmission of Infection.**—It was at first believed that the transmission of *Trypanosoma gambiense* by the tsetse fly, *Glossina palpalis*, was direct or mechanical, and that a fly lost its power of infecting 24-48 hours after feeding on an infected man. Kleine (1909) showed that this is not the case. In a certain percentage of flies the germs ingested with the blood do not die but multiply exceedingly in the fly's gut, change in form, come forward and at last invade the salivary glands, where they resume their blood form.

During the process, which occupies 14-28 days or more, the fly is not infective, but when the germs are established in the salivary glands it regains its infectivity and may retain it for a long period, for at each feed germs are poured into the puncture. Unless the salivary glands contain the germs a fly is not capable of infecting, but only in a small proportion is this development completed; in nature the proportion of infected flies rarely exceeds one in 1,000. Conveyance is therefore indirect. Direct infection may occur in nature, but the failure of the disease to spread in the absence of tsetse, even though biting insects of many kinds are present, seems to show it must be rare, e.g., hundreds of cases of sleeping sickness were recorded in the West Indies among slaves brought from Africa, but there is no recorded instance of spread in the New World. The disease was formerly rife in the island of Principe in the Gulf of Guinea, where *palpalis* abounded, but no cases occurred in the neigh-

bouring island of San Thomé, with the same insect fauna, but, like America, with no tsetse. Duke believes that when the disease is epidemic direct infection is the rule.

There is no evidence that the fly can transmit the germs to its offspring.

The fly has been shown to be capable of infecting for at least 96 days.

Other species of *glossina*, e.g., *morsitans*, *tachinoides*, become similarly infected, and it is probable that all the species are capable of conveying sleeping sickness; whether they do so or not depends in part on their habits; e.g., some species rarely attack man.

**T. Rhodesiense.**—In 1909 a second species of trypanosome was discovered in a case of human infection from Rhodesia and called *T. rhodesiense*. It is found in areas infested not by *G. palpalis* but by *G. morsitans*, and was shown by Kinghorn and Yorke (1911) to be conveyed by this species and to undergo in it a similar development. *T. rhodesiense* infections are found in Nyasaland, Portuguese East Africa and Tanganyika Territory, besides northern Rhodesia, and, rarely, south of the Zambezi river. *T. rhodesiense* cannot be distinguished from *gambiense* by its appearance in human blood; after inoculation into animals microscopical differences can be detected; since such inoculations are rarely made it may be more often the cause of sleeping sickness than is believed; its carrier is widely distributed. Indeed, a few cases have been found as far north as the Anglo-Egyptian Sudan; and near Mwanza, south of Lake Victoria, a small epidemic occurred in 1922, conveyed by a tsetse akin to *morsitans*. This type of human trypanosomiasis is rarely epidemic; cases occur in sporadic fashion. It is more acute and more rapidly fatal than the *gambiense* variety, and is more resistant to drugs. Whether or not *T. rhodesiense* is identical with *T. brucei*, the parasite of *nagana*, first described by Bruce in Zululand (1893), is undecided. Bruce and Yorke consider them to be the same; Kleine makes a distinction. They cannot be separated by their appearance under the microscope, the symptoms and course of the illness produced in animals, or the manner and site of development in the tsetse. Both complete their development in the salivary glands. If they are the same, man must, as a rule, be refractory to infection, for *T. brucei* is common in animals over a large fly-infested area of Africa.

*T. brucei* and *T. rhodesiense* are found in big game, especially Waterbuck, bushbuck, reedbuck, haartebeest, on which *G. morsitans* feeds. These animals are, therefore, reservoirs of germs capable of infecting man, and much discussion has taken place as to the rôle played by big game in the spread of *T. rhodesiense*, some claiming that the passage of the parasite is game to fly to man; others that it is man to fly to man. A decisive opinion cannot even now be given.

An experiment was made in East Africa during the World War in which blood was taken from transport animals infected with *T. brucei* and inoculated by Taute into himself, his colleague Huber and 127 natives. Though animals inoculated at the same time always became infected, there was no single instance of infection in man. They concluded that man is immune to infection by *T. brucei*. This striking experiment, however, does not convince those who believe man to be susceptible but very resistant.

As regards *T. gambiense*, it is generally agreed that infected man is the chief reservoir of infection, though Bruce (1911) found that antelopes can be infected with this trypanosome by allowing infected *palpalis* to feed upon them, and they continue to harbour the trypanosomes in their blood for many months, and though the sitatunga antelope (*Tragelaphus spekei*) is commonly infected under natural conditions on Lake Victoria (Duke). Domestic animals also harbour both trypanosomes, in the case of *T. gambiense* without sign of illness; whether they play any appreciable part in the spread of the human disease is unknown. Field observations have shown that in northern Nigeria and French Africa, south of Lake Chad, another tsetse, *G. tachinoides*, conveys a human trypanosome, probably *T. gambiense*. In these areas *tachinoides* is the only tsetse.

<sup>1</sup> These numbers refer to the problems discussed in 25.240.

*Treatment.*—Sleeping sickness is now treated by compounds of arsenic, especially *atoxyl* and *tryparsamide*, the latter a product of the Rockefeller Institute; by compounds of antimony, as tartar emetic; and by a drug of undisclosed composition called Bayer 205, or Germanin. The French and Belgians use *atoxyl* largely in the African villages, where doses are injected at the proper intervals by trained natives. A high degree of success is claimed, both curative and preventive, in that the blood is kept free from germs which might be taken up by the tsetse. *Antimonials* are used as a rule in conjunction or alternation with arsenicals. Bayer 205, first employed in the treatment of man in 1921, has remarkable successes to its credit in Europeans, especially in cases of the Rhodesian type which were refractory to other drugs; unless used with caution it has a harmful effect on the kidneys. It has been less successful in natives, perhaps because infection is usually detected in them at a later stage when the spinal cord and brain are affected, and at this stage treatment nearly always fails. French chemists have prepared the same or a similar drug. *Tryparsamide*, introduced about the same time, appears to be still more potent, and especially in cases in which the nervous system is involved, but it also has a serious effect in that it sometimes affects vision. Though sleeping sickness in the European is nearly always a fatal disease if left untreated, in the natives of parts of Africa it is very chronic, does not interfere with the patient's activities, and almost certainly may end in natural recovery. The means of prevention of sleeping sickness have been known in principle for 20 years, and depend upon the fact that infection is conveyed by tsetse flies and in no other way.

*An International Conference.*—At the instance of the League of Nations an International Conference on Sleeping Sickness met in London in 1925. In its recommendations it laid down administrative measures which should be taken on both sides of the frontiers between infected countries for the control of the disease, and advised the dispatch to Uganda of an international commission to study certain problems, such as immunity to the disease, the function of wild and domestic animals as breeding grounds for the virus, and the relations between *T. gambiense* and *T. rhodesiense* infections; work with curative and prophylactic drugs was also envisaged. The commission started work in 1926.

**SLESVIG:** see SCHLESWIG.

**SMALL HOLDINGS:** see ALLOTMENTS.

**SMALLPOX** (see 25:247).—Since about 1910 much knowledge of the nature of this disease has accrued in the course of attempts to discover the causal organism. This has been sought, though fruitlessly, in many direct investigations of the rash and of the blood by microscopical examination and by attempts to inoculate animals. The failure is explained, in part, by the discovery that the virus of vaccinia and, by analogy, also that of smallpox belong to the group of filter-passing viruses (see FILTER-PASSING MICROBES).

Jenner believed that cowpox (vaccinia) and smallpox (variola) have the same origin and nature. But attempts to inoculate the cow with smallpox matter failed and Jenner's opinion was not substantiated until Monckton Copeman and others proved that the virus of smallpox can be inoculated in the cow by a process of transmission or passage and that in the cow, under these conditions, typical lesions of vaccinia are produced. But although vaccinia is the same disease as smallpox, during its passage through the cow it has lost the power of producing a generalised septicaemic infection in man though it induces the typical lesion at the site of inoculation and by means of this local lesion, protects the vaccinated individual against the major infection from which the vaccine matter was derived.

*Use of Lymph.*—Establishment of the homologous relationship between variola and vaccinia widened the field of investigators into the nature of the contagium of smallpox by providing a material, viz., vaccine lymph, which is at once abundant and easily produced. By experiments in the rabbit, which is susceptible to vaccinia, the immunity conferred by vaccinia has been studied and it has been shown that certain specific substances or antibodies are produced in the blood and tissues of the vaccinated animal similar to those produced in typhoid fever and cholera, and that the antibodies in vaccinia and variola are apparently identical. It has been claimed, though on insufficient grounds, that this identity affords a means of certain diagnosis of the disease in doubtful cases of smallpox.

*Serum Therapy.*—In so far as the therapeutic application of the knowledge thus acquired is concerned, it has been shown that the serum of animals which are immune to vaccinia not only has protective power against vaccinia but also is possessed of curative properties because it destroys the virus of vaccinia *in vitro*. Whether this curative property is susceptible of increase by means of a graduated increase of dose of virus has not been investigated. In France, the serum of convalescent smallpox patients has been used in treatment and it is claimed that an undoubted curative result was obtained in cases which from clinical experience would almost certainly have proved fatal. But so far the virus of smallpox has not been obtained in quantity sufficient to permit of the attempt to manufacture a therapeutic serum, nor has it been shown that the immunity of an animal to vaccinia can be raised to a degree which might make its serum of value in the treatment of smallpox.

Polyvalent vaccines and serum prepared from pyogenic organisms have been used with some success in the treatment of severe confluent smallpox. This treatment is based on the assumption that the severity of the later stage of the illness in confluent smallpox, i.e. the stage of maturation or pustulation of the rash with the secondary fever of the disease, is closely associated with a secondary pyogenic infection.

#### HISTORY OF THE DISEASE

The mode of spread of smallpox may be illustrated by a short account of the incidence of the disease in Europe since 1910. It is convenient to divide the period into three quinquennia:—1. 1910-4, the period preceding the War; 2. 1915-9, the period of the War; 3. 1920-4, the period of gradual recovery from the War.

*Pre-War Incidence.*—During the first quinquennium no satisfactory arrangement existed among the European powers for the interchange of information concerning the incidence of epidemic diseases, and particularly from large areas where the disease is endemic and vaccination negligible, such as Spain, the Balkan States, Turkey and Russia, information concerning the rise and fall in incidence or even of serious epidemic extensions of the disease was scanty and unreliable. During this quinquennium the disease was very prevalent in Italy where a severe epidemic occurred in 1911-2. On the other hand, in France, Belgium, Austria, Germany, Denmark, Holland and the Scandinavian countries, smallpox was a rare disease as it had been since the beginning of the century. In England and Wales no extensive epidemic had occurred since the outbreak of 1902-3-4 and in the five years period before the War only 88 deaths from smallpox were recorded in Great Britain.

*The War Period.*—With the outbreak of War in 1914 the decline was arrested and the movement of armies and migration of civil population to and from the endemic centres in the east of Europe rapidly made itself felt by an uncontrolled and increasing spread of smallpox which reached its greatest intensity in 1919. In the end of 1914 and throughout 1915 severe epidemic smallpox carried by prisoners of war from Russia and refugees occurred in the states of the old Austrian Empire which bordered on Russia and also in the Balkans. Similar agencies scattered the infection throughout Germany and in 1916-7 there were outbreaks in Hamburg and other western towns. The incidence of the disease in Germany rose continuously throughout the

years of the War. Over 2,000 cases were recorded during 1917 and upwards of 5,000 during 1919. The infection reached Sweden on more than one occasion and a few cases occurred in Norway. In the Netherlands at least one serious outbreak occurred.

The experience of France during the war period was remarkable. The serious epidemic which swept over the country during the war of 1870-1 had not been forgotten and the French army of the World War was efficiently protected by vaccination. The invading German troops were also protected and no doubt acted as a screen to France on the east. Throughout the country, with the exception of districts on the Mediterranean coast and bordering on the Spanish frontier, the incidence amongst the civil population was low during the War. The freedom of France was reflected in the freedom of England during this period. The British army, like the French, was vaccinated and therefore in contrast to the experience of England in 1870-71, and in spite of the enormous volume of cross-channel traffic, only a small amount of smallpox infection reached England through France. In the later years of the War the revolution in Russia sent many refugees into this country who brought the infection via Scandinavia and the Murmansk coast. But the close guard maintained on the North Sea ports of Britain and the vigilance of her public health authorities prevented any serious attack on the civil population in spite of the increasing neglect of vaccination among the people.

*Post-War Incidence.*—In the third quinquennium, 1920-4, the bureau for the service of epidemiological intelligence and public health statistics was initiated under the authority of the League of Nations for the purpose of collection and interchange of information concerning epidemic diseases. The annual report from this source for 1924 deals with 29 European, 17 African, 20 American, 16 Asiatic countries and Australasia, and shows that in Europe smallpox incidence has diminished year by year since 1919. The effects of the War on the incidence of the disease in Russia and neighbouring countries, viz.: Czechoslovakia, Rumania, Austria, Poland, Finland and Germany reached their culminating point in 1919 and since that year the decline in prevalence in all these countries has been continuous and rapid. Similarly in Italy, where 34,365 cases were recorded in 1919, only 190 cases occurred in 1924. Although Spain continues to be the chief endemic centre in the west of Europe, the recorded deaths from smallpox in that country fell from 3,620 in 1919 to 1,214 in 1924. During the quinquennium England and Switzerland were the only European countries in which the incidence rose. In Switzerland the figure for 1924 shows a fall but in England the increase was progressive to the end of the period as seen by the following table:—

| Number of Cases of Smallpox Recorded in . . . | 1919 | 1920 | 1921 | 1922  | 1923  | 1924  |
|-----------------------------------------------|------|------|------|-------|-------|-------|
| In England and Wales . . .                    | 294  | 263  | 315  | 973   | 2,485 | 3,765 |
| In Switzerland . . .                          | 3    | 2    | 596  | 1,153 | 2,126 | 1,234 |

In both countries the mild type of the disease associated with the almost complete absence of fatality, led to the concealment of cases and an increasing neglect of vaccination.

#### VARIATION OF EPIDEMIC TYPE

Outbreaks of smallpox, like those of other infectious diseases, vary in their lethal power. In 1789 Jenner described an outbreak which occurred about seven years before in Gloucestershire, "of so mild a nature that a fatal instance was scarcely ever heard of . . . I watched its progress upward of a year without perceiving any variation in its general appearance. I consider it then as a variety of smallpox."

Observers in different parts of the world have directed attention to the occurrence of outbreaks which apparently resemble the one described by Jenner. An outbreak in South Africa was described by de Korté in 1904, under the name of Amaas or

Kaffir-pox, another by Ribas in Brazil in 1910, under the name of Alastrim, and others of a similarly mild character have been recorded in the United States, the West Indian Islands, Australia, and, as mentioned above, in England and Switzerland.

The opinions of many modern observers differ from that of Jenner who was satisfied in calling his outbreak a "variety of smallpox." That the form of disease observed in so many parts of the world belongs to the smallpox group is common ground. But some observers hold that it is more closely allied to chickenpox than to smallpox; others differentiate it from both diseases and regard it as a newly identified member of the group, while others maintain that it is a hybrid of smallpox and chickenpox, a true varioloid-varicella. On the other hand the weight of medical opinion in England inclines to the view that the disease is simply a mild type of smallpox.

*Clinical.*—Differentiation of the smallpox eruptions similar in type has become more certain and rapid through the work of Ricketts. Ricketts' thesis is that the focal rash of smallpox has a characteristic distribution governed by two complementary factors, viz.: exposure to irritation and protection against irritation, which determine a relative increase and decrease of the incidence of the rash on any part of the skin surface. These factors are independent of the course of the disease and of the evolutionary changes which constitute the features of the rash. They are also independent of modification of these changes resulting from variation in immunity possessed by the patient or of variation in the toxic power of the infecting virus. They have the further advantage of being objective and therefore less liable to confusion in interpretation than any others. They begin to be established with the beginning of the outcrop of the rash, are fully established when eruption is completed and remain unchanged as long as the rash lasts.

*Experimental.*—Blaxall, Cleland and Ferguson, Green and Gordon in England, and Leake and Force in America, have experimented on lower animals with material from the mild disease and also with material from severe cases of acknowledged smallpox, in order to determine what differences, if any, exist between the two conditions and in their immunological relations to each other and to vaccinia. The results of these investigations have been summarised by Ledingham, and confirm the opinion that the mild disease as it exists in England is smallpox of which the virus has lost a degree of its toxicity for man but retains its important properties for other animals. The distinction between the two viruses is one of lethal power only and the factors which govern this property are unknown. Over five years' experience in England of a widespread infection by the mild type of smallpox has afforded very little, if any, evidence of a tendency to increase in virulence. But in the absence of knowledge of the cause of variation in lethal power or of the natural conditions which may favour its occurrence, it is unsafe to assume that a low degree of virulence is a permanent feature of this type of smallpox and on that assumption to relax the stringency of administrative precautions against the disease.

(A. F. C.)\*

**SMEDLEY, WILLIAM THOMAS** (1858-1920), American artist (see 25.251), died at Bronxville, N.Y., March 26 1920.

**SMETONA, ANTANAS** (1874- ), Lithuanian politician and journalist, was born Aug. 10 1874 in the Ukmerge district, Lithuania. In 1897 he went to the University of St. Petersburg (Leningrad) as a law student, and received his diploma in 1902. Smetona edited the first Lithuanian daily, *Vilniaus Zinios* (Vilna News), and the democratic party organ *Lietuvos Ukininkas*. In 1905 he was elected a member of the Presidium of the Vilna (Wilno) Diet, which proclaimed Lithuanian autonomy, but

he continued his journalistic activities as editor successively of *Viltis* and *Vairas*. During the World War Smetona acted as chairman of the Lithuanian war relief committee. On the convocation of the Tautos Taryba, or national council, during the German military occupation of the country, he was unanimously elected its president, and in the spring of 1919 first president of the newly-proclaimed independent state of Lithuania, a post which he held till the spring of 1920, when the Constituent Assembly was convened at Kaunas (Kovno). After his retirement from the Government Smetona returned to journalism as editor of *Balsas*, *Vairas* and *Lietuvis*, which represented the National Progressives. In 1921 he served as chairman of the Lithuanian delegation at Riga during the negotiations on the settlement of the Latvian-Lithuanian boundary dispute. Early in 1923, when the insurrection broke out in the Memel territory against the German Directorate, Smetona was requested by the Lithuanian Govt. to compose the trouble in co-operation with the Allied representatives. In the same year he joined the teaching staff of the newly established university as lecturer on philosophy.

**SMILLIE, ROBERT** (1859- ), British politician, was born on March 17 1859 in Belfast, of Scottish parents. He left school when only 14 and worked first in a Clyde shipyard and later as a miner in the Lanarkshire pits. In 1894 he became president of the Scottish Miners' Federation, and later formed the Miners' Federation of Great Britain. Under his leadership the great strike of coal miners of 1912 was conducted and a national minimum wage secured. He was a member of the royal commission on mines set up in 1919 and presided over by Mr. Justice Sankey. He resigned the presidency of the Miners' Federation in 1921. Though best known as a miners' leader, Smillie possessed strong internationalist sympathies, and was an ardent pacifist during the World War. After seven unsuccessful contests he was elected M.P. for Morpeth in 1923. In 1924 he published *My Life for Labour*.

**SMITH, ALFRED EMANUEL** (1873- ), American politician, was born in New York City Dec. 30 1873. The son of humble parents, his father being a truck driver, he was educated in the St. James parochial school, and for several years was employed in the Fulton fish market. He was very popular with his associates, and at the age of 29 was offered the Democratic nomination for the New York State Assembly by the Tammany leader of the district in which he lived. He was elected for 1903, and by re-election served for 12 years. In 1911 he became Democratic leader in the Assembly, and was appointed vice-chairman of the factory investigating committee, which made a searching inquiry into industrial conditions in the State, resulting in remedial legislation. In 1913 he was Speaker of the Assembly. In 1915 he was chosen a delegate to the State Constitutional Convention, taking an active part in its proceedings. He opposed the constitution as finally revised, one reason being that it contained a provision designed to prevent New York City from having a majority of legislators. He "stumped" the State against its adoption, and it was overwhelmingly rejected. The same year he was elected sheriff of New York county, then a lucrative post because of the system of fees (later abolished), and in 1917 president of the board of aldermen of New York City. In 1918 he was elected Governor of the State of New York. He had been a strong supporter of woman suffrage, and in June 1919, as governor, called a special session which ratified the woman suffrage amendment to the Federal Constitution. The constructive legislation passed during his first term, including emergency rent legislation and the codification of the child welfare laws, established him as a progressive leader. In 1920 he was again the Democratic nominee for governor, but was beaten in the overwhelming Republican landslide of that year; he lost, however, by only 73,000 votes, whereas the Democratic candidate for president was at the same time defeated by 1,000,000 votes in New York State.

In 1922 Smith was renominated by the Democratic party for governor, and was elected by the largest majority ever given to a candidate for the office, receiving 1,397,633 votes as against

1,011,723 for N. L. Miller. At the Democratic National Convention of 1924 he received strong support for the presidential nomination, dividing the votes with W. G. McAdoo so as to produce a deadlock, until, on the 103rd ballot, J. W. Davis was nominated as a compromise. At the state election in Nov. 1924 he was re-elected governor, receiving 1,627,111 votes as against 1,518,550 for Theodore Roosevelt, the Republican nominee. This was the first occasion in one hundred years that a governor had been twice re-elected. This was another striking demonstration of Governor Smith's popularity, especially as the Republicans carried every other state office by large majorities. His record of constructive legislation has continued throughout his three terms, and includes housing legislation; a state park system, improvements in child welfare and labour laws, the recommendation and adoption of bond issues for the construction of State hospitals and other public buildings, and the final adoption of the Hughes plan to reorganise the State government, including the adoption of an executive budget.

**SMITH, ALFRED HOLLAND** (1863-1924), American railway official, was born in Cleveland, O., April 26 1863. He began work on the New York Central railway system as a messenger-boy in 1879. After serving in various capacities he was in 1890 appointed superintendent of the Kalamazoo division of the Lake Shore and Michigan Southern Railway. He was successively division superintendent, assistant general superintendent and general superintendent of the Lake Shore road. In 1902 he became general superintendent of the New York Central Railroad, in 1906 vice-president of the New York Central system, and in 1914 president. When the American railways were taken over by the U.S. Govt., Dec. 27 1917, he was appointed assistant director-general and worked out the form of central and regional administration under which the railways were managed during the 26 months of Government operation. He was re-elected president of the New York Central lines in June 1919. He died in New York City March 8 1924.

**SMITH, FRANCIS HOPKINSON** (1838-1915), American author, artist and engineer (see 25.260), died at New York City April 8 1915.

**SMITH, JEREMIAH, JR.** (1870- ), American lawyer, was born at Dover, N.H., Jan. 14 1870. He graduated at Harvard University (A.B., 1892) and the Harvard Law School (LL.B., 1895). In 1895 he became secretary to Mr. Justice Gray of the U.S. Supreme Court, but in 1896 commenced the practice of law in Boston. He was a captain in the Quartermaster Corps A.E.F. in France 1918. At the conclusion of hostilities he was appointed counsel to the Treasury Dept. in Europe and was associated in that capacity with the U.S. Peace Commission, acting also as an adviser in financial matters. On the conclusion of peace he resumed practice in Boston. In April 1924 he accepted the position of commissioner-general of the League of Nations in Hungary, and took up his duties in Budapest May 1. He was successful in stabilising the currency and placing Hungarian finance on a sound basis, his report of July 1925 for the fiscal year showing a surplus, instead of the deficit anticipated in the League's reconstruction plan. On the completion of his work, July 1926, he again resumed practice in Boston.

**SMITH, THEOBALD** (1859- ), American pathologist, was born at Albany, N.Y., July 31 1859. He was educated at Cornell (Ph.B., 1881) and at the Albany Medical College (M.D., 1883). In 1884 he was appointed director of the pathological laboratory of the bureau of animal industry, in Washington, where for 11 years he investigated infectious animal diseases. At the same time he was professor of bacteriology at Columbian, later known as George Washington University. From 1895 to 1915 he was director of the pathological laboratory of the Massachusetts State Board of Health, and after 1896 was professor of comparative pathology at Harvard. In 1915 he was appointed director of the department of animal pathology of the Rockefeller institute of medical research, at Princeton, New Jersey.

His numerous scientific papers include *Investigations into the Nature, Causation, and Prevention of Texas or Southern Cattle Fever* (1893); *The Relation between Bovine and Human Tuberculosis*

(1896-8); *The Immunizing Effect of Neutral Toxin-antitoxin Mixtures in Diphtheria* (1909); *Milk-borne Epidemics of Human Streptococci* (1915); *The Protective Value of Colostrum* (1922); *The Relation of Bovine Infectious Abortion to Malta Fever* (1925).

**SMITH COLLEGE** (see 25.273).—Between 1910 and 1926 Smith College added to its equipment Burton Hall for biology, a new music building (Sage Hall) with auditorium, and an additional gymnasium with swimming pool. The number of dwelling houses for students increased from 16 to 45. The library in 1925 contained 121,000 volumes and the Hillyer Art Gallery had increased its endowment to \$450,000. The Tryon Gallery had been built.

All students now enter by examination. In 1925-6 there were 204 teachers and 2,158 students, of whom 59 were graduate students, and the endowment was \$4,500,000, the total assets being over \$10,500,000. The college publishes, besides its permanent bulletin, the *Smith College Studies* in history, modern languages and classics, and contributions of the Dept. of Biology. President Seelye was succeeded in 1910 by Marion LeRoy Burton (b. 1874), who was succeeded in 1917 by William Allan Neilson (b. 1869). In the World War the Smith College relief unit, the pioneer among American college women's units overseas, worked in the Somme, France, from July 1917 until April 1920, with the exception of the period after the retreat of March 1918, until the following January. Another small group worked as a Smith unit with the Near East relief in Armenia. In 1920 a system of special honours was established, by which selected students follow out their individual interests under the direction of tutors; and in 1925 a scheme was initiated of sending students specialising in French to France to spend their junior year in study at French institutions under the guidance of a member of the Smith College staff. In the same year the college established a personnel bureau for greater individualisation in dealing with students, both socially and academically, and an institute for the co-ordination of women's interests to study and experiment with methods of enabling women to maintain their intellectual interests, both cultural and professional, after graduation. The Department of Education conducts a school for retarded children, a progressive day school and a nursery school.

(W. A. N.)

**SMITH-DORRIEN, SIR HORACE LOCKWOOD** (1858- ), British general, was born May 26 1858. He joined the army in 1876, took part in the Zulu War and in the Egyptian campaign of 1882 and, attached to the Egyptian Army, served at Suakim in 1884 and on the Nile in 1885-6. He took part in the Tirah campaign of 1897-8 and showed conspicuous skill in handling troops. His marked ability as a commander in the field won him rapid and repeated promotion first in the final advance to Khartoum and later in South Africa. After being adjutant-general in India, he had the opportunity to show his powers as a trainer of troops, first in command of a division, then at home in command at Aldershot until 1912, when he was transferred to the Southern Command.

On the death of Sir James Grierson in Aug. 1914, Sir H. Smith-Dorrien was appointed commander of the II. Army Corps. His troops received the brunt of the enemy's onset at Mons, and, although his action in giving battle at Le Cateau was criticised, it was subsequently recognised that it saved the British Army from disaster. Afterwards he commanded his corps at the battle of the Marne, on the Aisne, and during the severe fighting in Flanders in Oct. and November. On the splitting-up of the Expeditionary Forces into two armies he was appointed to the command of the II. Difficulties with the commander-in-chief led, in April 1915, to his return to England where he was placed in charge of one of the Home Defence armies. In the following Nov. he was chosen to take charge of the operations against German East Africa, but he fell ill on the voyage out, and had to return home. From 1918-23 he was governor and commander-in-chief of Gibraltar. In 1925 he published *Memories of 40 Years Service*.

**SMOKE AND SMOKE PREVENTION.**—Industrial and domestic smoke still pollutes the air of towns. Measurements of the ex-

tent of air pollution have been carried out on scientific lines, and estimates of the resulting economic loss have been carefully computed. There is no doubt that public opinion is now definitely aroused on the question, and the averagely intelligent citizen is alive to the fact that a polluted atmosphere is both dangerous to health and very expensive. The miners' strike in Great Britain in 1921, which caused town air to be almost smokeless for some months, undoubtedly played a part in educating public opinion.

*Measurements of Air Pollution.*—In 1912 a British committee for the investigation of atmospheric pollution was appointed as the result of an International smoke abatement exhibition held in London. This committee, although originally unofficial, was subsequently attached to the Air Ministry through the Meteorological Office, and issues an annual report which gives an elaborate analysis of the deposits collected from the atmosphere by means of soot gauges placed at various stations in different parts of the kingdom. Although measurements by this method are subject to error and can only be regarded as approximate at best, they yet give an indication of the magnitude of the yearly sootfall, and they also show the difference in the amount of solid matter deposited in residential, as compared with industrial, towns, and in different parts of the same town.

The following table contains sample readings selected from the *10th Report* published in 1925:—

| Town                               | Annual Total Solid Deposit Tons per square mile | Period        |
|------------------------------------|-------------------------------------------------|---------------|
| London:                            |                                                 |               |
| Golden Lane                        | 425                                             | 1923-4        |
| Wandsworth Common                  | 229                                             | 1923-4        |
| Glasgow:                           |                                                 |               |
| Richmond Park                      | 400                                             | 1923-4        |
| Queen's Park                       | 240                                             | 1923-4        |
| Birmingham:                        |                                                 |               |
| Central                            | 552                                             | 4-yr. average |
| Southwestern                       | 159                                             | 4-yr. average |
| Blackburn:                         |                                                 |               |
| Technical college (centre of town) | 636                                             | 1923-4        |
| Fever hospital (on outskirts)      | 227                                             | 1923-4        |
| Newcastle-upon-Tyne                | 882                                             | 1923-4        |
| Rochdale                           | 762                                             | 5-yr. average |
| Kingston-upon-Hull                 | 403                                             | 1923-4        |
| Kingston-upon-Thames               | 162                                             | 1923-4        |
| Southport                          | 128                                             | 1923-4        |
| Rothamsted (Harpenden)             | 123                                             | 4-yr. average |

It should be pointed out that only a small proportion of British towns keep records; those given above with relatively high readings are not necessarily the smokiest. Several towns with a bad reputation for air pollution have either declined or ceased to record their sootfall.

Comparable figures for cities in the United States, representing for each city the average of from 8 to 16 stations, as reported by H. G. Meller, of the Mellon Institute, University of Pittsburgh, are given below. These figures are for insoluble deposit only, and for average monthly (not annual) deposit.

| City       | Monthly Insoluble Deposit Tons per square mile | April to September of Years |
|------------|------------------------------------------------|-----------------------------|
| Pittsburgh | 96.1                                           | 1923-4                      |
| Pittsburgh | 170.7                                          | 1916                        |
| Pittsburgh | 82.3                                           | 1912                        |
| St. Louis  | 55.6                                           | 1916                        |
| Cincinnati | 43.8                                           | 1916                        |

<sup>1</sup> Average of five months only.

In addition to the soot gauge, which measures *deposited* impurities, there is a method of measuring *suspended* impurities by means of an automatic filter invented by Dr. J. S. Owens. The records are taken by means of a circular disk of thick filter paper, the revolution of which is controlled by a clock, and at short intervals a volume of two litres of air is filtered through a

$\frac{1}{4}$ -in. diameter spot on this disk, leaving behind it the suspended impurities. The little discoloured spots left round the edge of the disk are the actual records; the quantity of impurity in the air is estimated by comparison with a calibrated scale. By means of this filter the variation of impurity from hour to hour and from day to day can be ascertained. The 7th report of the advisory committee, issued in 1922, gives an interesting comparison between Sunday and week-day records in London, from which the very important conclusion was drawn that in London the domestic fire was responsible for over two-thirds of the total smoke.

*Loss of Sunlight.*—Medical discoveries as to the benefit of sunlight in the treatment of disease justify the conclusion that, in ordinary living conditions, light is necessary for the maintenance of health. From this point of view the cutting-off of the ultra-violet rays by smoke must seriously affect the physical well-being of town dwellers. The diagram given below, which was prepared in the department of the medical officer of health for

could be saved upon their maintenance if the air were as pure in towns as it is in rural districts. These three attempts to estimate the cost of smoke in terms of cash prove beyond doubt that the total loss for the United Kingdom, when all forms of damage have been allowed for, must amount to many millions a year, exclusive of the damage to health, which cannot be measured in money.

*British Legislation.*—A departmental committee on smoke abatement, which had been appointed in 1914 but suspended during the World War, was reconstituted in 1920 with Lord Newton as chairman. The committee issued their report in 1921, and their general conclusions were that the prevalence of smoke pollution in Great Britain was mainly due to the indiscriminate and wasteful use of raw coal for all purposes, whether industrial or domestic, and to the lax administration of the law by the responsible authorities, coupled with the inaction of the central authority. The committee's chief recommendations as to changes in the law were as follows:—

FIG. 1.—Graph showing Manchester daylight, as percentage of light received in Timperley. Each individual record representing average daily light for the week.

Manchester, shows the relatively small amount of light received in the centre of Manchester in the course of a year compared with Timperley in Cheshire, on the borders of the city.

*Loss through Smoke.*—An elaborate investigation into the damage done by smoke was carried out in Pittsburgh in 1912 by a committee of experts, acting under the auspices of the University of Pittsburgh. They computed the damage for that city annually at £2,000,000. As the result of this investigation Pittsburgh embarked upon a thorough and scientific smoke abatement campaign, and succeeded in reducing the air pollution in a marked degree. Another investigation dealing with one item only of the extra cost due to smoke, namely household washing, was carried out by the Manchester air pollution advisory board, a sub-committee of the City Council. The inquiries were made by a trained investigator, and the conclusion, confirmed by a certificate from a leading firm of accountants, who stated that the figures were on a very conservative basis, showed that the cost of household washing in Manchester would be reduced by about £250,000 a year if Manchester were as clean as Harrogate. Sir Frank Baines, director of H.M. Office of Works, who has under his charge 6,000 buildings, including government offices and places of historic interest, is of the opinion that at the very least £120,000 a year

*Industrial Smoke.*—(a) that the word "black" should be omitted and that smoke of any colour might be dealt with as a nuisance;

(b) that there should be a general legal obligation on all manufacturers to use the best practicable means having regard to all circumstances of the case for avoiding pollution of the air by smoke, and that the same law should apply to all Government establishments and all rail and road locomotives, and to steamers on rivers, estuaries and lakes;

(c) that the Minister of Health should be empowered to fix standards from time to time, and in any case in which the amount exceeds the standard so fixed the onus of proof that the manufacturer is using the best practicable means should be on the manufacturer.

*Domestic Smoke.*—(a) that the Minister of Health should decline to sanction any housing scheme submitted by a local authority or public utility society unless specific provision is made for smokeless methods of heating;

(It is to be regretted that in view of the immense amount of house building undertaken since 1920, this recommendation, although not requiring fresh legislation, has remained a dead letter.)

(b) that the Govt. should encourage the co-ordination and extension of research into domestic heating generally.

(c) that local authorities should be empowered to make by-laws requiring the provision of smokeless heating methods in new buildings other than private dwelling houses.

Other proposals dealt with changes in administrative responsibility.

Since the Departmental committee issued its report, three smoke abatement bills, embodying some of the recommenda-

tions, were introduced into the British House of Commons, but up to Dec. 1925 none had been passed. In many quarters it is held that purely punitive legislation will not be sufficient to deal with the smoke nuisance. The Coal Smoke Abatement Society is seeking to insert an amending clause in any future bill for permitting joint action between local authorities, manufacturers and fuel experts (1) to make research into smoke prevention in manufacturing operations and as to the heating arrangements in large buildings, and (2) to arrange for the training of stokers in the best methods of stoking.

The steady expansion of the electrical and the gas industries has, without doubt, effected an improvement in the atmosphere of towns. According to the latest report of the Electricity Commissioners the number of units sold to consumers in the year 1922-3 was 3,762 millions (of which 2,548 millions were used for power). This was three times the number of units sold in the year 1912-3. Gas cooking in urban houses is becoming more and more common, and builders have at last ceased to install kitchen ranges in new houses as a matter of course. The number of gas cookers and grills in use in England and Wales in the present year (1925) exceeds 4,500,000. Unfortunately it is still doubtful whether low temperature carbonisation coke, which would solve the domestic smoke problem entirely, will be available for general use in the near future. The technical difficulties have been largely overcome, but it is uncertain if the coke can be manufactured at prices that will compete with house coal. Experiments are, however, being made by the Fuel Research Board and by private firms.

**SMOKE: IN WARFARE.**—The first historical reference to the use of smoke in war, was the miracle whereby the Israelites were protected during their march from Egypt to the Promised Land (Exodus XIV. 19). In this old Biblical story of the Israelites lying the whole essence of the use of smoke in war—the blinding of one's enemy. In the civil wars of the Roman Empire both Caesar and Pompey used smoke as a weapon of attack, chiefly in landing operations.

*Examples from History.*—There appears to be little or no mention of the use of smoke for many centuries after this, but we find an instance in the 17th when on July 2 1667 the Dutch Fleet appeared off Landguard and its ships took up their positions to bombard it from all sides at once. Some of them were placed exactly to windward so that the smoke of their guns swept along the beach and so covered the landing of their troops from the sight of the mariners in the fort. Captain Silas Taylor—the keeper of the King's store at Harwich—saw the whole attack from the Dovercourt Cliffs and the next day dispatched the following account of it to Whitehall:—

It was judged that the eight Dutch ships who sent such clouds of smoke upon the fort out of the Rolling Grounds (part of the sea just south of Landguard Point) were merely for that purpose; that they landed about 2,000 men I have reason to believe from my own guess. . . . In the mean a party of 300 or 400 or more ran along the beach in the smoke that the ships from the Rolling Ground had made, up to the Landguard Fort with scaling ladders, of about 20' long or more, hand grenades etc.

In the battle of Seneff in 1674 smoke was used by the French when, as a stratagem to cover their retirement, they hung up their lighted "matches" in the hedges. In 1770 Charles XII. of Sweden used smoke in the crossing of the Dwina in his campaign against the Saxons. On this occasion specially constructed barges carrying tar barrels were used.

The Waterloo campaign had a great effect on the use of smoke in war, as it was realised at this time at what an enormous disadvantage the defence were in by the use of the black powder, which wrapt them in clouds of smoke, but it was not till 1885 that the introduction of smokeless powder was brought about by the French. Domokos, in the Turko-Greek War of 1897 was the last battle fought in Europe with smoke powder, and a remarkable fact that it was not till 1915—nearly 20 years later—that a means on the battlefield was devised of projecting smoke on an enemy.

An experiment in the use of attacking by throwing forward smoke candles, such as were used for testing drains, was tried at Aldershot before the South African War and was rightly condemned, as the whole essence of the success in the use of smoke is the element of surprise and the blinding of the defenders by the attackers which can be done by smoke projection. No mention of the use of smoke is made in the histories of the South African and Russo-Japanese Wars, though the Boers on occasions lit veldt fires to cover their withdrawal.

*The World War.*—The first instance of the use of smoke in the World War was probably the lighting of a haystack north of the La Bassée Canal in Oct. 1914, which enabled a company of the Devonshire Regiment to be withdrawn. Shortly after this a battery of artillery in somewhat like manner made good its withdrawal. At Loos in Sept. 1915 smoke was wrongly used as a blind by lighting candles in our trenches, and consequently brought down heavy shell fire. From this battle may be dated the realisation of the necessity of the projection of smoke and its use in attack, and danger to any defence.

By Nov. 1916 smoke shells were in use in some divisions in France, but it was not, however, until the battles of Arras 1917, when they were used by the 9th (British) Div. that the art of accurately projecting smoke-shells, and their great value, came to be really appreciated. Many instances in 1917 and 1918 are on record when numbers of lives were saved by the invention of smoke-shell and when victories were gained with a minimum of casualties by the use of smoke. The Germans quickly copied the British and used it in their offensive of March 1918, while the Australians used it to cover their withdrawal over the Piave in May 1918. The navy used smoke with conspicuous success at Zeebrugge on St. George's Day 1917, when fast coastal motor-boats greatly assisted the blocking operations, by blinding the enemy's observation and shore guns.

Smoke, which may be used in war by artillery, infantry, aircraft and tanks, has certain inherent disadvantages, in particular the blinding of observation, and the variability of wind—the latter is a serious difficulty—but by practice all difficulties can be overcome, and certainly the history of the War has proved that the advantages caused by the use of smoke far outweigh the disadvantages. It may be said of smoke that if properly used it will on almost every occasion in the attack, and also in the withdrawal, save many casualties. By its use the utmost is made of "fire power," and man power is concealed until the decisive stages. Infiltration—an art in war—is facilitated and losses are greatly reduced by the use of cover by ground and cover by smoke. The chief object in the use of smoke-tactics, is, as far as possible, to impose on the defenders the conditions of night, while the attackers have the conditions of day, and thereby effect surprise and reduce casualties. To summarise the use of smoke in war it may be said that it is used to obtain concealment of movement which begets surprise.

(P. R. W.)

**SMOOT, REED** (1862– ), American politician, was born at Salt Lake City, Utah, Jan. 10 1862. He was educated at Deseret University and at the Brigham Young Academy, Provo, Utah. He amassed considerable wealth as a banker and woollen manufacturer. In 1895 he was appointed one of the presidents of the Utah State of the Church of Jesus Christ of Latter Day Saints (Mormon), and in 1900 was made an apostle. He was elected to the U.S. Senate from Utah in 1902. Attempts were made to prevent his entering the Senate because of his connection with the Mormon Church and on the charge that he

personally favoured polygamy and was a polygamist. He was allowed to take his seat; but the matter was referred to the Senate committee on privileges and elections for investigation. In June 1906 the committee by a vote of seven to five recommended that he be unseated; but as the personal charges against him had not been proved the Senate in Feb. 1907, by a vote of 42 to 23 refused to remove him. He was re-elected in 1908, 1914 and 1920. He took an active part against the United States becoming a member of the League of Nations. He is chairman of the Finance Committee of the Senate and a member of the World War Foreign Debt Commission.

**SMUGGLING:** see BOOTLEGGING AND SMUGGLING.

**SMUTS, JAN CHRISTIAAN** (1870– ), South African statesman and general, was born May 24 1870 near Riebeeck West, Malmesbury district, Cape Colony, the son of J. A. Smuts and Catharina de Vries. In 1886 he commenced his studies at Stellenbosch, and in 1891 went to Cambridge, where his success was unprecedented. In 1895 he was admitted to the Cape Town Bar. During the early part of his legal career he did a considerable amount of journalistic work, in both English and Dutch. In Oct. 1895 his first political speech was delivered at Kimberley, where, as a result of the understanding between Jan Hofmeyer and Rhodes, he defended the latter's policy. The Jameson Raid, which followed in Jan. 1896, changed the whole complexion of South African politics. Smuts ranged himself on the side of the Transvaal, and shortly afterwards joined the Bar at Johannesburg. In 1898, though two years under the legal age, he was made state attorney by President Kruger, and took part in the negotiations with the British agent at Pretoria concerning the franchise. He also accompanied Kruger to Bloemfontein, where the abortive conference with Milner took place in July 1899.

In the early stages of the Boer War, Smuts' remarkable versatility and capacity for hard work found full vent in legal and organising activity. In the occupation of Pretoria, in 1900, he joined the Boer field forces. From the Eastern Transvaal, where his Government was hard pushed, he made his way to the West, where he had wider scope. He saw much fighting under De la Rey, and subsequently acted as commander-in-chief of the Boer and Cape rebel commandoes in the Cape. He was besieging a mining camp in Namaqualand, when Botha sent for him to take part in the peace negotiations at Vereeniging (1902). He threw in his weight on the side of those who urged a compromise, as against the intransigent commandants.

After peace, Smuts became a strong and active protagonist of Botha's policy—loyalty to the new order, and racial conciliation. Practising as a barrister at Pretoria, he spent a good deal of time in the reconstruction of the remnants of the Boer nation and together with Botha and other leaders he met Mr. J. Chamberlain at Pretoria. The Boers, supported by part of the British population, strongly opposed several points in Milner's policy, e.g., the importation of Chinese coolies for the gold mines, and Smuts was among those who refused Lord Milner's offer of seats in the nominated Legislative Council.

In 1904 Botha and Smuts founded the political organisation open to both races known as "Het Volk" and it was largely owing to its opposition that the Lyttelton constitution for the republics was never put into force. Early in 1906 Smuts visited London, where he worked for fully responsible government in the Transvaal and Orange Free State, which was granted in 1906. Early in 1907 elections for the Assembly were held. Smuts took a prominent part and was returned unopposed for Wonderboom (Pretoria). As Colonial Secretary, under Botha, he became the driving force of the Cabinet, interesting himself particularly in education and defence. His Education Act marked a new departure in South Africa. In May 1908 Smuts openly launched out in favour of the union of the South African colonies. In Oct. of that year, the National Convention, which eventually produced the South African Act, began its labours, Smuts being one of its most valued members, both in debates and in drafting committees. On May 1910 Union was consummated. Smuts was elected member of the legislative

assembly for Pretoria West, and became Minister of the Interior, Mines and Defence.

In the Union Assembly Smuts continued to occupy a most prominent place, thanks to his forceful measures as well as striking speeches. In 1911 the South African party was founded at Bloemfontein, where Smuts foreshadowed the political difficulties ahead. Early in 1912 he introduced his Defence Bill, which powerfully affected the future of South Africa. A little later, H. C. Hull (Minister of Finance) left the Botha Cabinet owing to differences with Sauer, a Cape Minister. Smuts thereupon surrendered the Ministry of Interior and Mines, retaining Defence and took over the Treasury. During the Hertzog crisis, at the end of 1912, he did his utmost to prevent a split, but once the fateful step had been taken, he resolutely supported Botha.

In July 1913 a revolutionary strike shook the Rand to its foundations. Botha and Smuts, at great personal risk (and unescorted) saved the situation at Johannesburg, after Lord Gladstone had sanctioned the use of Imperial troops to quell disturbances. In Jan. 1914 an attempted general strike was nipped in the bud by Smuts, who in record time rushed up the commandoes but recently organised under his Defence Act. The deportation of nine strike leaders on the S.S. "Umgeni," though authorised by the Cabinet, has been chiefly debited to Smuts by his opponents, and at the time created a furore. A double Indemnity Bill, covering the two revolts, led to a violent and protracted parliamentary debate.

The outbreak of the World War shifted the South African centre of gravity to Smuts' office. In Sept. 1914, when Beyers resigned as Commandant-General in the midst of the preparations for a campaign against the Germans in Southwest Africa, Smuts assumed his functions. The rebellion of De Wet, Maritz, Beyers and others followed. This was suppressed by Botha, acting in the closest collaboration with Smuts at headquarters. The execution of the rebel commandant Joseph Fourie, contrasting as it did with the extraordinarily mild treatment meted out to his superiors, caused a great political upheaval and helped to swell Hertzog's following. In 1915, after a visit to Botha's forces in Southwest Africa, Smuts took the leading part in the general election, which was marked by extreme bitterness. On at least one occasion, his life was in great danger at a meeting, the rancour of the Government's opponents being directed chiefly against him. He was re-elected for Pretoria West by a narrow majority. Early in 1916 he refused the command offered him in East Africa by the Imperial Govt., but shortly afterwards yielded to representations. Immediately after his arrival the tide, which had been rather in favour of the Germans, turned. Although their resourceful and gallant commander, Von Lettow-Vorbeck, with a handful of die-hards, succeeded in escaping, the campaign—which had called for the utmost vigour—was virtually over when Smuts left for London via South Africa early in 1917.

*Work in London.*—In March Smuts arrived in London to represent South Africa at the Imperial War Conference, and was sworn as a privy councillor. After the Conference, a dinner was given in recognition of his war services, by members of both Houses of Parliament. There he made his declaration on the British Commonwealth of Nations, which had become a landmark in constitutional development. Offered the command in Palestine, he declined. He accepted a seat in the War Cabinet, taking a deep interest in the flying services, and his proposals for their unification were accepted by the Cabinet. He was also chairman of the committee that framed the bill for an Air Ministry, and worked out the organisation for the new Force. Incidentally, he supervised London's air defences. He suggested, and became chairman of, the War Priorities Committee, which settled priority of claims among departments concerned in the War, and allocated man-power and other resources. Occasionally he visited the Western front, where he conferred with commanders. In Dec. 1917 Smuts met Count Mensdorff at Geneva, and explored the possibility of a separate peace with Austria; but was finally convinced that it was not possible. The follow-

ing Feb. he spent with Allenby in Palestine, working out plans for a great advance.

After the Armistice, Smuts wrote his Memorandum on the League of Nations, *The League of Nations: A Practical Suggestion* (1918), which received the support of both President Wilson and Mr. Lloyd George, and in substance became the Covenant of the League. With Botha, he represented South Africa at the Peace Conference, where he was mainly concerned with the Covenant and Dominion status. At this time he undertook a mission to Vienna and Pesth, where the Communist Govt. had violated the Armistice.

After the conference, he returned to South Africa. In Aug. 1919, he became Prime Minister of the Union (in succession to Botha). During this period he twice attended the Imperial Conference. In 1921 his visit was notable for the part he played in securing peace in Ireland. During the Conference of 1923 (held while the Ruhr crisis was at its worst), he advocated a fresh attempt to settle the European situation. The suggestion was generally approved, and the Dawes Commission followed.

In 1920, repeated attempts to reunite the South African party and the Nationalists failed. The Unionists, under Smarts, decided to dissolve their organisation and to join the South African party. The consequences of this fusion lost Smuts a certain amount of support among both English and Dutch. A general election, held on that issue, left him, however, with a working majority, and the combined party did fairly well in Parliament. In 1922, however, another workers' revolt on the Rand (which had to be suppressed by the military and burghers, after the exercise of considerable patience) led to a junction of forces between advanced Nationalists and the Labour element. Bye-elections went against the Government, and a formal pact was made by the two Opposition parties. In 1924, after a crucial bye-election, Gen. Smuts took the country by surprise; he dissolved Parliament, realising that the people were probably dissatisfied with him. The result, nationally considered, thoroughly bore out the wisdom of his decision, for the South African party was heavily defeated. Hertzog did not obtain a clear majority, but was able with the assistance of Labour to form a coalition Cabinet. Although Smuts himself lost Pretoria West, he was elected unopposed for Standerton, Botha's old constituency.

As Opposition leader, he continued to pay close attention to affairs of state, while indulging to some extent his fondness for philosophy and botany. In 1925 he delivered, as president of the S.A. Association for the Advancement of Science, the opening address at the congress of that body. In 1926 he published *Holism and Evolution*, a philosophical treatise. (N.L.E.)

**SMYRNA** (see 25.281), a town and vilayet of Turkey. At the Peace Conference in 1919 Greece put forward a claim to the Smyrna area. That area had, it was understood, been assigned by the Agreement of St. Jean de Maurienne (April 17 1917) to Italy, but owing to Russian objections that agreement had never been ratified. M. Veniselos argued on the Greek claim before the Council of Ten on Feb. 3-4 1919. The final decision of the Council of Three, authorising the Greeks to occupy Smyrna, was taken apparently without the knowledge of the Italians, who had withdrawn temporarily from the conference, or of the American expert advisers to President Wilson. The occupation was in theory an Allied occupation, but was generally taken to mean acceptance of the Greek claims. Greek troops occupied Smyrna on May 15 1919.

The first entry of the Greeks was marked with many atrocities against the Turkish population. Under the Treaty of Sèvres, Aug. 10 1920, it was stipulated that the town of Smyrna and the Ionian hinterland were to be under Greek administration for five years. Greece was empowered to maintain military forces in the zone and to incorporate it in the Greek Customs system; but a local parliament, elected on a franchise giving representa-

tion to all sections of the population, was to be established and the provisions of the minorities treaty signed between Greece and the principal Allied Powers were to apply to the Smyrna zone. After five years the local parliament might ask for definite incorporation with Greece; the Council of the League of Nations might as a preliminary require a plebiscite. In the event of incorporation, Turkish sovereignty was to cease. The Greek claim was based on ethnographical grounds. Reliable racial statistics for the area were not available, but an American computation of 1914 gave the total population as 1,057,000, including 509,000 Turks, 470,000 Greeks and 78,000 others.

This decision caused general dissatisfaction. Turkish forces under Mustafa Kemal and the Greeks were soon engaged in hostilities, in which at first the Greeks were successful. Mustafa Kemal, however, continued to consolidate his position in Turkey, while the fall of Veniselos (Nov. 1920) and the return of King Constantine to Greece (see GREECE) weakened the sympathies which Greece had enjoyed in Great Britain, her chief supporter among the Allied Powers. At the London Conference, Feb.-March 1921, it was proposed to place a gendarmerie controlled by the Allies in the Ionian area, and to have a Christian governor of the whole area under the League of Nations, the arrangement to be subject to review by the League of Nations at the end of five years. Both the Greek and the Kemalist delegates to the Conference rejected these terms. The Greeks renewed their offensive but their initial successes were not sustained. The Paris Conference, Feb.-March 1922, proposed to restore the Smyrna zone to Turkey; but the negotiations broke down on other points, and the Kemalists drove back the Greek Army, which with many thousands of Greek refugees from all parts of Asia Minor embarked hurriedly and left Smyrna, which the Turks entered on Sept. 9 1922. Under the Treaty of Lausanne (July 24 1923) Smyrna and the surrounding zone reverted under full Turkish sovereignty.

Meanwhile, the town and district had suffered frightfully under the atrocities of both belligerents, and these sufferings culminated when, a few days after the Turkish entry into the town, fire broke out in the Armenian quarter, and Smyrna was soon in flames. When the conflagration had burnt itself out, only the wretched Turkish quarter on Mount Pagus was untouched, and more than three-fifths of the city was destroyed, including all the banks, business houses and consulates in the European quarter on the quay. The loss of life was impossible to compute. A town planning scheme for the rebuilding of the city met with opposition on the grounds of expense, since before the fire only 14% of the total area of Smyrna was not built over, and the new plan gave 55%. A plan was said to have been approved in Sept. 1925. The city was then still in ruins, with the exception of the Turkish quarter.

Before the World War Smyrna extended for some three miles along the gulf of the same name, for about a mile along the Gulf of Burnabat, and almost to the summit of Mount Pagus. In 1925 the flour-milling industry was growing and improving, there were two cotton spinning establishments, and the carpet-making industry was reviving. Smyrna is the second port of Turkey in importance, it has good railway connections with the interior, and trade is again improving, but is hampered by lack of facilities, and by the regulation which forbids vessels to enter or leave the gulf of Smyrna between sunset and sunrise. Efforts have been made to develop an air service, with headquarters at Smyrna, but owing to the shortage of pilots and mechanics it has not become efficient. Turkish sources in 1924 estimated the population of the town at 98,846, a reduction of nearly two-thirds on the population in 1914. (O. J. R. H.)

**SMYTH, ETHEL MARY** (1858- ), British composer, was born in London April 23 1858, the daughter of Gen. J. H. Smyth, C.B. She studied music at Leipzig under Heinrich von Herzogenberg, whose wife was a friend of Brahms. Though encountering much opposition in her musical career, she successfully produced her first opera *Fantasio* at Weimar in 1898, others being given at Leipzig, Prague and Vienna. Her first opera to be produced in London was *Der Wald*, given at Covent Garden in 1902

which was followed by *The Wreckers* (1909), a vividly romantic work. Her *Mass in D*, first performed in 1893, was revived 30 years later. *The Boatswain's Mate*, a comic opera, was produced in 1916 with considerable success. Dr. Ethel Smyth took a prominent part in the militant suffragist movement, and composed *The March of the Women* (1911) the battle song of the W.S.P.U. In 1922 she was made a Dame of the British Empire. Her compositions include *Fête Galante* (1923) and *Entente Cordiale*, 1924, operas; also chamber music, choruses and songs, all characterised by energy of invention, exuberant vitality and adroitness of workmanship. In 1919 Dame Ethel published her brilliant memoirs *Impressions that Remained*, followed by *Streaks of Life* (1921).

**SMYTH, HERBERT WEIR** (1857– ), American classical scholar, was born at Wilmington, Del., Aug. 8 1857. He was educated at Swarthmore (A.B., 1876), Harvard (A.B., 1878), Leipzig and Göttingen (Ph.D., 1884). During 1883–5 he was instructor in Greek and Sanskrit at Williams College, and then for two years was reader in Greek at Johns Hopkins University. From 1887–1901 he was professor of Greek at Bryn Mawr. In the latter year he was appointed professor of Greek literature at Harvard. During 1899–1900 he was professor at the American Classical School at Athens. From 1889–1904 he was secretary of the American Philological Assn. and editor of its *Transactions*, and in 1904 was elected president.

His works include *The Ionic Dialect* (1894); *Greek Melic Poets* (1900); *Greek Grammar for Colleges* (1920); *Aeschylus*, text and translation (1923). He was also author of various contributions to philological journals. He was editor of the *Greek Series for Colleges and Schools* (20 vol.).

**SNOUCK HURGRONJE, C.**: see HURGRONJE, CHRISTIAN S.

**SNOWDEN, PHILIP** (1864– ), British Labour politician, was born on July 18 1864 at Cowling, Yorkshire. Educated at an elementary school, he read widely, and became a clerk in the customs and excise department of the Civil Service. Joining the Independent Labour party in the year after it was founded (1893) he became one of its most effective speakers and, in 1903, and again in 1917 its chairman. His first parliamentary attempts, for Keighley and Blackburn, failed, but, in 1906, he was returned for Blackburn as Labour M.P. In the House he at once made his mark, notably on financial matters. When war broke out in 1914 he was in Australia. On his return he at once ranged himself with J. R. MacDonald and shared much of the latter's unpopularity. Defeated in the 1918 election, he won Colne Valley for Labour in 1922, and held the seat with increased majorities in 1923 and 1924. His appointment as Chancellor of the Exchequer in Mr. MacDonald's Cabinet was approved on all sides.

In his Budget, introduced in April 1924, while limited by the commitments of his predecessor, Mr. Snowden went a long way to redress the burden of taxation on the poor by his reduction in the food duties, and by making provision, in his contingent Old Age Pensions Act, for the removal of the oppressive features of the thrift disqualification. At the same time, he stood fast to the Free Trade principles of which he had been so doughty a champion in earlier years, by repealing the McKenna duties on imported motor-cars, clocks, musical instruments, etc., and terminating the duties imposed under the 1922 Safeguarding of Industries Act. Later in the session he introduced plans of constructive work designed to relieve the prevalent unemployment. At the London Conference in July–Aug. 1924, he took charge of the discussions with the bankers which ended in the successful flotation of the German loan in Oct. of that year.

Snowden's power, both in the Labour movement and outside, was due as much to gifts of character as of brain. As a speaker, he was equally powerful both as a private member in opposition and as a minister. Most of his life was spent in the service of Socialism; he was also a powerful advocate of the emancipation of women and of temperance. In the promotion of these causes, as in his work for peace and in his opposition to Communism, he was notably assisted by his wife, herself a speaker and writer of wide appeal. He was member of the Liquor Con-

trol Board during the War, and served on royal commissions on the civil service, canals and venereal disease.

He is the author of various books, among them *A Socialist Budget* (1907); *A Living Wage* (1912); *Socialism and Syndicalism* (1913); *Wages and Prices* (1920); *Labour and National Finance* (1920); *Labour and the New World* (1921). (M. A. H.)

**SOAP**: see OILS and FATS.

**SOCIAL ANTHROPOLOGY** (see 2.108c).—Investigation of many peoples by a rigorous linguistic and statistical technique has produced a mass of accurate information that may be quantitatively gauged by comparison of the first and second editions (1910 and 1922–3) of G. Buschan's *Illustrierte Völkerkunde*. There naturally followed co-ordination from both historical and psychological points of view, and, though in reality intertwined, these are best treated under separate heads.

#### CULTURE HISTORY

As substitutes for the "evolutionary" syntheses of men like E. B. Tylor and Lewis H. Morgan, several "diffusionist" schemes have been elaborated. However, this label, though convenient, fails to define the essential difference, since the earlier writers also used the principle of transmission even to the extent of deriving all clan systems from one centre (Morgan). What really characterises them is the belief in historical laws. Human institutions, Tylor held, follow one another "in series substantially uniform over the globe."<sup>(1)</sup> Knowing the formula of progress, the anthropologist can predict the future and reconstruct prehistory—as when Morgan infers a matrilineal stage of Hellenic society.

The notion of laws of sequence is amenable to the direct test of pre-history, and stands refuted by it. While in Europe stone tools are succeeded, first by copper (bronze), and then by iron tools, the African negroes passed directly from the Stone to the Iron Age. Similarly, in Italy the Solutrean period of the Palaeolithic is lacking, and so forth. Thus, Tylor's "substantial uniformity" is not demonstrated: if laws exist, they are masked by incalculable disturbances that render them metaphysical rather than scientifically useful concepts.

*Modern Diffusionists*.—The "diffusionist" reconstructions, then, spurn formulae of sequence and view cultural phenomena as historical, i.e., individual events. One school, fathered by the late W. H. R. Rivers, is headed by G. Elliot Smith and W. J. Perry; a rival system outlined by F. Graebner has latterly been amplified by Father W. Schmidt. Both schemes ignore the possibility of independent duplication. Similarities are *ipso facto* evidence of transmission, and the proof is perfect when not merely single traits but complexes recur—megalithic monuments and a sun cult, conical roofs and a solar mythology, rectangular huts and a division into matrilineal moieties.<sup>(2)</sup>

Apart from their antipathy to independent invention, the two schools differ profoundly. The British diffusionists are pan-Egyptians,<sup>(3)</sup> an "archaic civilisation" evolved in Egypt prior to 2600 B.C. and then spread to the four quarters of the globe, reappearing elsewhere in varying degrees of decay; the ruder cultures are not "primitive," but degenerate. Before contact with "the archaic civilisation," the Australians lacked magico-religious beliefs and practices, and a dual organisation, "when discovered in some outlying part of the world, would be sufficient witness of the existence of Egyptian influence."<sup>(4)</sup>

In contrast to this monism, Graebner and Schmidt are pluralists. To follow Schmidt<sup>(4a)</sup>, a primeval culture corresponded to the hunting type of life of recent Pygmies and Pygmoids. From this there branched off at different times and localities three "primary" cultures. One was based on woman's invention of tillage, with consequent development of a matriarchal polity, female deities and a lunar mythology. Another culture evolved from the perfection of primeval hunting methods, the rise of masculine crafts, patrilineal descent—associated with totemism, male deities and a solar mythology. A third group of hunters domesticated livestock and became pastoral nomads. The subsequent course of history consists in the spread and interaction of these three *Kulturkreisen*. By fusion of the first two there arose

village life, with its combination of husbandry and craftsmanship; while the impact of nomadism upon this joint product laid the foundation of the Near Oriental proto-civilisations.

Solid achievement must be credited to both diffusionist schools. While the complexity of culture had been discovered before Graebner and Rivers, their insistence has made historical analysis a commonplace of anthropological research. Again, Elliot Smith's denial of laws due to the "psychic unity" of mankind has exposed the impotence of that principle so long as it is impossible to explain why a *constant* factor does not yield uniform results. Above all, diffusionists have envisaged all culture as a connected whole.

Nevertheless, fatal defects of method make acceptance of either scheme impossible. The pan-Egyptian view implies a complete passivity of all non-Egyptian peoples, yet many ingenious devices current in ruder cultures and rooted in local conditions disprove this corollary. Indeed, the irreversible flow of cultural elements from the more complex to the ruder cultures is refuted in history. The Caucasians borrowed maize and other cultivated plants from the American aborigines, and B. Laufer's studies show that the Chinese repeatedly profited by contact with peoples of inferior level<sup>(5)</sup>.

Again, the procedure of both schools in segregating a selected number of features as an historical unit is arbitrary. Thus, Graebner and Schmidt have it that totemism was originally joined with paternal descent. What, then, of the matrilineal totemic tribes in northwestern America and the Pueblos of Arizona and New Mexico? Schmidt assumes that in either case matrilineal descent was introduced by Athabascan neighbours. But since most Athabascans lack definite rules of descent, his logic is radically unsound; for by inventing auxiliary hypotheses *ad hoc*, it is manifestly easy to prove anything and everything. An equally vital defect lies in the vagueness of the concepts used. To say that two peoples share a sun-cult or a solar mythology is to hide possible diversity under a label of merely descriptive utility. Proof of transmission depends on the comparison of phenomena, the sharpness of whose definition guarantees identity.

*Independent Origins.*—Still more unfortunate is the denial of independent origin, though this is demonstrable for the dual organisation that plays so prominent a part in both schemes. Thus, the probably once exogamous *Pezoma* and *Pepfuma* moieties of the Angami of Assam are no longer so, hence in one village all the people were marrying among themselves if of different clans; and since these numbered only two, they correspond exactly to the classical form of dual organisation<sup>(6)</sup>. But in the Hopi village of Shipaulovi the same result was achieved by the extinction of one of three clans. The dual division accordingly cannot figure as the invention of one people, but is a recurring institution that may have arisen five hundred times in the course of human history—now by a reduction of clans, now by the fusion of two intermarrying groups into one tribe and again by other processes.

*Convergence.*—We have here a perfect example of convergence, a process which F. Boas<sup>(7)</sup> and A. A. Goldenweiser<sup>(8)</sup> have powerfully argued to establish as a reality. They have shown that in many situations confronting man the possible number of solutions is so small that any particular one has a high degree of probability and is likely to be duplicated.

Independent origin is also demonstrated by linguistic phenomena, which are merely a specialised department of culture. If the dual number could develop independently in Greek and in Shoshoni (Idaho), if the use of reduplication in Takelma (Oregon) is not derived from contact with ancient Greece<sup>(9)</sup>—then, too, stories about the moon or the conquest of monsters cannot be offered as evidence of cultural connection.

A sense for historical reality must, then, reject as equally dogmatic the assertion of uniform sequences and the derivation of all similarities from a single invention. Historical realism will rigidly exclude as useless for comparison any but sharply individualised features; it will trace distributions over continuous areas, will appeal to the ascertained facts of linguistics and other

sciences; and, above all, will use the findings of archaeological stratigraphy as the surest point of departure and ultimate arbiter in questions of chronology.

Auxiliary tests of relative antiquity are not lacking<sup>(10)</sup>. The most important of these is the assumption that the range of distribution is proportionate to age. Though challenged and liable to correction in specific cases, the general utility of this criterion is guaranteed by supplementary checks. Thus, Kroeber argues for the antiquity of girls' adolescence rites in California<sup>(11)</sup>, not merely because of their universal distribution but from the concomitant fact of local differentiation. In general the appeal to pre-history supports the correlation of age with range: a universal trait, such as the use of fire, dates back to Mousterian times. The dog is at once the most general and most ancient of domesticated animals. The bow, at least of Azilian antiquity, has (barring Australia) a comparable range. In ancient Egypt the plough is seen as a newcomer crowding out the hoe; and the hoe remains, until recent times, the most common implement of husbandry. Since Europe remains the only major area systematically explored by stratigraphic methods, historical reconstruction must remain tentative.

*Facts of Distribution.*—The facts of distribution themselves may suffice for chronological inferences. The sinew-backed bow, which in Egypt goes back to the second millennium B.C., is characteristic of many Asiatic peoples, and occurs in the New World only north of Mexico and west of the Missouri. It may, therefore, be interpreted as a comparatively recent acquisition from Asia that failed to establish itself beyond the far west of the United States. From the same angle, systematic comparison of North and South American ethnography is bound to yield interesting results. The absence of the tambourine from South America indicates that it can hardly belong to the oldest "proto-American" layer of culture. On the other hand, E. Norden-skiöld's discovery of Gran Chaco games that almost exactly duplicate North American forms<sup>(12)</sup> places these traits as definitely older, even though we are unable to give a precise definition in chronological terms. Still more remarkable are the implications of Gusinde's and Koppers'<sup>(13)</sup> researches in Tierra del Fuego: the Yahgan at the extreme tip of the continent are found to share with the Indians of British Columbia initiation rites during which the novice is obliged to drink through a tube and to scratch his head with a special "head-scratcher." The specific character of these features and the arbitrariness of the association leave little doubt as to the identity of the phenomena; and it is reasonable to ascribe to them a very great antiquity.

Established facts as to the history of domesticated animals and cultivated plants are rightly reckoned among the most valuable aids in the tracing of cultural connections. Thus, the cultivated banana is invariably propagated from side-shoots and has long ago become seedless; hence its range over a wide area in southern Asia and Polynesia is incontrovertible evidence of diffusion. Moreover, the cultivated banana of Africa cannot possibly have been derived from the botanically distinct wild banana of Africa, which produces no side-shoots; its importation from Asia is accordingly demonstrated<sup>(14)</sup>. Apart from the historical evidence that the banana was indigenous in America, fossil banana seeds have been found in Tertiary—perhaps Oligocene—beds in Colombia. This does not necessarily prove that South America was the region of origin<sup>(14a)</sup>. Similarly, the humped variety of cattle found in parts of Africa has been identified with the zebu of India, while the long-horned breed can be traced with practical certainty to Egypt, if not beyond. Whenever a route of migration has thus been ascertained by objective methods, it is proper to inquire for additional traits that may have travelled along the same path. If we are sure that the zebu came from India we shall be on the lookout for other elements of culture from that source, such as cotton and the loom; while the affinity of South African with Egyptian cattle enables us to trace the history of Bantu head-rests as well.

*Use of Linguistics.*—An unquestionable linguistic relationship likewise serves as a secure starting-point for ethnographic comparison. As Tylor showed long ago, the Malagasy share

with their fellow-Malayans a type of bellows utterly distinct from any on the neighbouring mainland, hence the invention must have spread to Madagascar from a Malaysian centre. In the case of so specialised a device as this "piston-bellows," mere recurrence in the same general part of the world is adequate proof of transmission; accordingly, the Nagas of Assam appear as cultural kindred of the Indonesians, and this conclusion is corroborated by other points of community, such as the equally distinctive terraced irrigation system of the Angami Nagas and the Malay-speaking Ifugao of the Philippines.<sup>(15)</sup> By concentrating upon points of unmistakable identity Miss Laura Watson Benedict<sup>(16)</sup> has succeeded in demonstrating the generically Indonesian substratum in the religion of Mindanao natives, has separated later Hindu accessions and rendered probable an infiltration of Indo-Iranian ideas. Modern methods of divination in Indonesia have been identified with Babylonian hepatoscopy of about 2000 B.C.,<sup>(17)</sup> and R. Andree<sup>(18)</sup> follows the distribution of shoulder-blade divination from Bering Strait to northwestern Europe.

The cultural bond of western and eastern Asia, of Asia and Africa, of easternmost Siberia and Europe, is thus definitely established, and the sinew-backed bow has been cited as evidence of connection between the two hemispheres. Indeed, the joint study of the Old and the New World has already produced positive results of considerable importance. The Lapp's tambourine is not only widely spread in both Siberia and North America but appears with curious frequency in association with the shamanistic office, a combination not easily explained except by contact of the cultures in question. Over a large part of the same territory hunters exhibit a characteristically apologetic attitude toward a slain bear, and practice similar rites of propitiation. Above all, the systematic investigation of hundreds of myths has led to some astonishing conclusions. The Koryak of Siberia, whose material life is very much like that of the Eskimo, are mythologically much more closely allied to the Indians of southern British Columbia. An ancient contact of these now widely separated populations is thus demonstrated, the connection being broken by a possibly retrograde movement of the Eskimo.<sup>(19)</sup> In the case of one story shared by European, Siberian and American folk-lore—that of the Magic Flight—even so stout-hearted a champion of independent origin as Andrew Lang admitted dispersal from a single centre.

*The Deluge Myth.*—Among the stories discussed by Jochelson<sup>(20)</sup> the deluge myth is one of the most interesting. It is not merely a narrative of a general flood, which would be devoid of historical cogency, but contains the specific detail of animals diving for mud to be used in the rehabilitation of the earth. This characteristic episode occurs in North America from the Atlantic to the Pacific, and also among the Chukchi, Yukaghir, Buryat, Turkic and Finnic tribes. It is now possible to add two Bodo tribes of the Tibetto-Burman family—the Garos and the Kacharis.<sup>(21)</sup> Moreover, Mr. Hutton has mentioned Naga parallels to tales recorded among the Lapps, whose original home lies in or near Siberia.<sup>(22)</sup>

As corroboratory testimony from another field may be cited the religious sanction of homosexual inversion in North America, Siberia and Indonesia, and the striking resemblance between the priestly activities of the inverts in Borneo and among the Chukchi.<sup>(23)</sup> Considering the historic migration of Buddhism from India to Mongolia, a cultural bond between Siberia and southern Asia cannot be waved aside as inherently improbable. But if we admit the possibility, an alternative is supplied for the speculative attempts to interpret mythological and other coincidences between Asia or Oceania and America by contact through a direct water route. It is then possible to proceed on the orthodox principle of tracing continuously distributed traits over demonstrated paths of dissemination.

Orthodox principles of comparison, then, suffice to span continental distances and to co-ordinate the ethnographic and archaeological data of the globe; and if the chronological results lack a spurious completeness, they have a compensatory solidity.

In one respect historical realism enjoys a definite superiority

over the extremist schools. Diffusionism, in asserting the absolute singularity of cultural events, bars causal explanation. If, say, agriculture and pottery arose jointly only once in the history of mankind, their association may be a chance occurrence; and their joint diffusion is due to chance contacts. On the other hand, if like features arise independently and linked with the same concomitants, a functional relationship may be demonstrable.

Thus, there are tribes in Assam, California, Nebraska and South Africa<sup>(24)</sup> who, in their kinship terminology, fail to distinguish the maternal uncle from his son; while in Arizona, Montana, California and Melanesia others class the paternal aunt with her daughter. The former peoples are patrilineal, the others matrilineal: the kindred included under one head are in both cases in the same clan. This is not a *law* for we cannot predict that a given patrilineal or matrilineal tribe will so fuse distinct generations; but we can predicate a correlation between types of fusion and rule of descent. Similarly, Tylor's correlation between moieties and unilateral merging of lineal and collateral kin holds if, with Rivers,<sup>(25)</sup> we substitute clans for moieties. In the statistical determination of such correlations lies one of the most fruitful lines of future research.

#### PSYCHOLOGICAL PROBLEMS

A decade ago anthropology seemed to have few points of contact. It had become clear that racial differences, even if ascertainable by unequivocal tests, could not explain the history of a people's culture, which varies too rapidly to be correlated with hereditary changes. The uncertainty of the psychological interpretations offered bred an aversion from psychology, which was enhanced by the desire of a new science to assert its individuality. Hence, such declarations of independence as A. M. Hocart's "Psychology and Sociology"<sup>(26)</sup> and A. L. Kroeber's "The Superorganic."<sup>(27)</sup> Rivers went a step further, maintaining that only through the study of cultures could the psychologist understand the workings of the human mind.<sup>(28)</sup> Today psychologists admit that culture co-determines the individual's mental life;<sup>(29)</sup> while anthropologists have fallen back from their intransigent position. Even Kroeber<sup>(30)</sup> finds a non-psychological treatment of society sterile.

This is not surprising; for the very phenomena formerly envisaged from a purely historical angle harbour a host of psychological questions.<sup>(31)</sup> Why do peoples adopt alien features? Why are some traits accepted while their concomitants are spurned? Can the mere idea of, say, pottery be transmitted without instruction in the technique? Such are among the problems that beset the historian, who, consciously or unconsciously, must turn psychologist.

The late Dr. Rivers furnished partial solutions: primitive peoples, he contended, would readily adopt foreign elements, even when introduced by small bodies of immigrants, provided these possessed a material culture that powerfully impressed the aborigines. Since, however, transmission is by no means regularly the result of movements of population, this theory has at best limited applicability. More damaging still is the adherence to custom by the American natives, swamped, not merely visited, as they are by possessors of a superior technology.

*Culture Contacts.*—Boas has indicated the selective character of borrowing, and suggests that people are receptive toward elements more or less prefigured in their culture. This, however, is avowedly rather a formula defining a programme of observation than a causal explanation. What is required is the careful analysis of concrete instances. Pioneer service has been rendered by P. Radin, whose "Sketch of the Peyote Cult of the Winnebago"<sup>(32)</sup> illustrates how a borrowed culture may be levelled to a cultural pattern of long standing.

But contact may prove a creative factor. "The introduction of new ideas," says Boas, "must by no means be considered as resulting purely mechanically in additions to the cultural pattern but also as an important stimulus to new inner developments."<sup>(33)</sup> Thus, the fusion of diverse types of social organisation on the west coast of Canada has led to novel arrangements. Similarly Rivers<sup>(34)</sup> shows how certain art styles originate from

the mingling of two Melanesian trends. In East Africa the subjection of one people by another has repeatedly created a caste system unparalleled in the previous polity of either conqueror or vanquished. Re-valuations ensuing upon the borrowing of ceremonial traits have been illustrated by L. Spier.<sup>(35)</sup> In the domain of technology the Chinese derived glazing from western Asia; but centuries of experimentation culminated in a creative synthesis—the invention of porcelain.<sup>(36)</sup> In the North American Plains area the introduction of the horse proved at least a potent factor in the spread of cultural features.<sup>(37)</sup>

#### HUMAN INVENTION

To turn to another aspect of the subject, anthropologists must take cognisance of the differences in outlook between participants of the lowlier and the higher cultures. If these are not to be correlated with inborn differences, how shall we appraise them? L. Lévy-Bruhl<sup>(38)</sup> assumes that ruder peoples are possessed of a pre-logical mentality. R. R. Marett<sup>(39)</sup> and Goldenweiser,<sup>(40)</sup> however, have shown that primitive man displays in everyday life precisely the same sort of thinking as ourselves, while his irrational speculations are paralleled by equivalent phenomena in the highest civilisations. In short, there is at best a difference in degree, not in kind. Even our advanced technology establishes no basic group difference, for its psychological correlates are confined to narrow bodies of specialists.

Apart from the effects of intensive specialisation, human invention does not seem to differ in principle throughout the course of history. There is certainly no inexhaustible reservoir of ideas for effective adaptation to environment: the Fuegian shivers without manufacturing adequate dress; the Navaho fails to utilise stone material for masonry; European peasants do not automatically conceive advanced sanitary regulations. Between maximum exploitation of the environment and that minimum prerequisite to continued existence there lies a vast scale of cultural values. Mankind is certainly prone to muddle along with traditional devices, and in so far Graebner and Elliot Smith are right in challenging the assumption of an indefinite inventiveness.

Nevertheless, the fact remains that most peoples are not merely passive recipients of foreign culture; everywhere we encounter adaptations that could only have originated on the spot. Snow-goggles were not invented in Egypt for export to the Arctic. In South America the poisonous manioc becomes, through an elaborate treatment, the staple diet. In Brazil and the Chaco, lack of stone leads to the perfection of wooden tools. Even where foreign influence is certain, the re-working of the received elements, as in the case of porcelain, may involve a creative synthesis. This conclusion must re-act upon our interpretation of similarities: if primitive tribes have sometimes ingeniously solved their problems, why insist that certain solutions were beyond them simply because they had already been achieved elsewhere?

**Psycho-analysis.**—Naturally the progress of psychological science itself has reacted upon anthropological interpretation. Religion is hardly intelligible without the concepts of suggestion and hypnotism, and with the rise of psycho-analysis came new explanatory principles. Unfortunately the ethnographic naïveté of psycho-analysts has discredited their interpretations of culture, while Rivers achieved little more than to paraphrase cultural phenomena in the new phraseology.<sup>(41)</sup> Genuine illumination is, however, afforded by B. Malinowski,<sup>(42)</sup> who shows that the results of repression and conflict must vary with sociological differences, and suggests comparative analysis of patrilineal and matrilineal communities.

To the impetus of psycho-analytic thinking must also be credited C. G. Seligman's attempt to record primitive dreams—an undertaking of first-rate significance in view of the part dreams play in aboriginal life.<sup>(43)</sup> Finally, one cardinal doctrine of psycho-analysis is amply corroborated by anthropological data. Decorative designs, rituals, tales that have been diffused from one centre become secondarily linked with new symbolism, cosmic or biological explanation.<sup>(44)</sup> Thus, "rationalisation" merges in Boas' still wider principle of secondary association.

The orthodox psychology of a past generation is still capable of stimulating anthropological inquiry. Quite recently Gustav Theodor Fechner's work in experimental aesthetics has suggested measurements and detailed comparison of the decorative patterns found in Plains Indian rawhide cases. Thus, there has been secured a more exact definition of local styles and a clearer conception of the subjectively significant elements of decoration.<sup>(45)</sup> Similarly, Galton's descriptions of colour and number associations in his *Inquiries into Human Faculty* have an obvious bearing on relevant ethnographic data.

**The Value of the Individual.**—Of deeper import is the Galtonian theory of individual differences that so largely dominates psychology to-day. Thanks to Father Schmidt, Marett, Boas and others, the dogma that on primitive cultural levels the individual is completely submerged in the group is definitely shattered. Boas has stressed the skilled craftsman's influence on the development of art.<sup>(46)</sup> Radin has studied individual literary endowment through distinct versions of the same tale,<sup>(47)</sup> and has propounded the theory that monotheistic beliefs are correlated with a definite temperament, and accordingly may be expected to occur with a certain frequency, irrespective of cultural plane.<sup>(48)</sup> R. Thurnwald<sup>(49)</sup> accepts the varying capacities of, say, Papuans as an established proposition; and R. H. Lowie<sup>(50)</sup> systematically surveys individual variability as to sensory type, suggestibility, intellect, idiosyncrasies and leadership. In short, modern anthropology accepts personality as one of its irreducible phenomena and recognises in the interaction of individuals and the social tradition they confront, combat, succumb to or dominate, one of its perennial problems.

These attempts to saturate ethnography with psychological points of view are as yet merely inchoate gropings toward a fuller comprehension of the subject. They are far from affording an insight into the spirit of other cultures. No wonder that those of little faith have grown restive and are blaming anthropological technique: a liberation from methodological bondage is their recipe for "a proportionate rise in creative ideas."<sup>(51)</sup> This hope is a delusion and a snare. There is no royal road to an alien people's true inwardness. Only by piecemeal labour on the elements of culture and their concrete psychic correlates can we rise above the impressionist's pseudo-synthesis, and by reliving aboriginal experience with its affective tinge attain that union of intellectual and imaginative enlightenment which must be our goal.

**SOCIALISM** (see 25.301).—Throughout the world the War of 1914-18 and its aftermath have profoundly altered the position of Socialism in national and international affairs; and its doctrines and policies, already in rapid change before the War, have been correspondingly modified in the light of post-War conditions. Above all, the Bolshevik revolution of 1917 has deeply affected every Socialist movement and party, and has caused in many countries a re-grouping of Socialist forces of which the full effects are still impossible to predict.

In the years immediately before the War, the outstanding changes in Socialist policy were due mainly to two causes—the growth of Socialism as a parliamentary force, and the rise of new ideas of industrial organisation and action. Not only in Great Britain, but also in Germany, France, Italy and other countries, the Socialist movement, either directly or through a Labour party, had become a powerful force in national politics, and had accordingly begun to shape its policy to suit parliamentary requirements. This had led on the one hand to the rise of "revisionist" doctrines, modifying the militant Marxism of earlier days, and on the other to revolts and criticisms from the Left Wing, directed against the compromising tactics of the official Socialist parties. Thus in Great Britain the Labour party which had first become an important party after the election of 1906, was accused of allying itself with Liberalism and so betraying the Socialist cause. There were similar divisions of opinion in every developed European country.

**Industrial Unionism and Syndicalism.**—Of more importance, however, in the years before the War, was the growth of new industrial movements and theories. During the first decade of the 20th century, prices had risen, without an equivalent rise in wages. This led to a wave of reaction against parliamentary methods, which, it was urged, could not really protect the workers' standard of life. Industrial unrest became widespread. The theories of Industrial Unionism and Syndicalism exerted a wide influence on working-class opinion. The former, arising in America, largely among the immigrant workers, proposed a mass organisation of the whole working class, without distinction of craft, sex or grade, for the revolutionary overthrow of capitalism by direct industrial action, with or without parliamentary action as an auxiliary. The latter, arising in France, largely under Anarchist-Communist influence, was a definite attempt to replace parliamentary by industrial methods, and to bring about revolution by mass trade union action leading to working class control of industry and the reconstruction of society on the basis of purely working class institutions. In Great Britain, a small

Syndicalist movement grew up during the period of great strike activity between 1911 and 1914; but far more important was the widespread influence of the new ideas on the trade union movement. Guild Socialism, which developed rapidly from 1912 onwards, was an expression of this same tendency, stated in terms better adjusted to British conditions, and aiming at a reconciliation of Socialism and Syndicalism by combining the Socialist plan of public ownership of the means of production with the Syndicalist plan of workers' control in industry and society.

**Socialist Parties Split by the War.**—The outbreak of the War altered the entire situation. It checked the movement of industrial unrest, and acutely divided the Socialist forces. In every belligerent country some Socialists supported and some opposed the participation of their countries in the War; In Germany, France and Great Britain and in most of the smaller States the majority of the Socialist supported the War; but in each case a powerful and growing minority opposed it. In Great Britain the Labour party supported the War, and after a time entered into Coalition Governments for its prosecution; but the Independent Labour party, largest and most influential of the Socialist bodies, took the opposite view, though it remained throughout an affiliated section of the Labour party. In Germany the Social Democratic party broke eventually into two sections—the majority, which backed the Government, and the Independent Socialists, who refused their support. These cleavages became more pronounced as the War continued, and the growing losses and hardships steadily swelled the volume of anti-War opinion in all countries, and especially in Germany.

In 1917, under the strain of war, the old régime in Russia hopelessly broke down. A political revolution placed first a body of liberal reformers and then the moderate Labour groups under Kerensky in nominal power. But the attempt, in face of complete national exhaustion, to carry on the War brought on a further revolution, by which power passed to the Bolsheviks, the Left Wing Socialist party which later adopted the name of Communist party. The Bolsheviks established a "proletarian dictatorship," made peace with Germany at Brest-Litovsk, and set out to work among the war-weary peoples of the belligerent countries for a world-wide Socialist revolution.

**Bolshevism.**—The Bolshevik revolution, by which for the first time a Socialist Govt. assumed complete political and economic power in a great country, everywhere profoundly affected Socialist thought and policy. At first its influence was mainly in the direction of "pacifism," and it certainly helped to undermine the war morale of the German people. But when, in the autumn of 1918, the resistance of Germany at length gave way, the revolution which followed did not result in the triumph of Socialism. For a while the Socialists appeared to be the leading power in the new German Republic; but, subjected to the victorious Allies and fearing starvation by blockade, the German Socialists, still disunited, did not attempt to force their power home, and gradually, after a series of disturbances, Germany assumed the shape of a constitutional Republic in which industry and property remained on a capitalist basis.

#### THE POST-WAR RECONSTRUCTION OF SOCIALIST PARTIES

Meanwhile, the conclusion of the War had led in other countries to a great increase in the strength of the Socialist movement. Every Government had made lavish promises of reconstruction after the War, and great hopes had been aroused. A great mass of recruits from all classes flocked into the Labour and Socialist parties. Everywhere there were great industrial as well as political movements. In Great Britain, the Labour party reconstructed itself in 1919 as the party of the "workers by hand and brain," and the trade unions showed, in 1919, great activity in presenting and pressing their demands for improved conditions. Idealism was in the air; plans of drastic social and economic reconstruction got widespread attention; and Governments went some distance towards compromise with the new forces whose development they feared. Constitutional Labourism gained the most converts; but Communism, spreading from

Russia, made its appearance in every country as an organised revolutionary movement, preaching the class war and denouncing moderate Socialism as a middle-class doctrine designed to mislead the workers and divert them from the task of revolutionary action.

For two years after the War, trade prospered and wealth appeared to abound. But then came everywhere a pronounced industrial slump, causing widespread unemployment and a severe fall in both wages and profits. Plans of social reconstruction were hastily jettisoned; great strikes or lock-outs, such as the British miners' lock-out in 1921, broke the power of the trade unions; a wave of reaction swept across the world. The European governments attempted to break the power of Communism by the ostracism and blockade of Russia, which had offended against capitalist standards by wholesale confiscation of property and repudiation of debts, as well as by propaganda in other countries; and, while the Socialists everywhere opposed these measures, the deep cleavages between Communists and orthodox Socialists in the European countries helped to undermine their influence, and added to the fundamental weakness caused by the decline in the demand for labour.

From the end of 1920 to the end of 1925, to which this article extends, the slump remained in being, especially in Great Britain, and everywhere trade union membership declined and there was a fall in the working-class standard of life. This, however, did not necessarily involve a decline in the voting strength of the Socialists in parliamentary elections. Thus the British Labour party which in 1910 (Dec.) secured 370,802 votes and 42 seats in the House of Commons, and in 1918 (on the new franchise) 2,244,945 votes and 57 seats, got 4,348,375 votes and 191 seats in 1923, and, despite adverse electoral conditions, 5,551,549 votes and 151 seats in 1924. Moreover, after the 1923 election a Labour Govt. for the first time in British history assumed office, albeit as a minority administration dependent on Liberal support. Under these conditions, however, it was unable, like the Socialist governments which have held office in Sweden, Denmark and other countries, to take any important step towards a distinctively Socialist policy.

*British Parties.*—The cleavage between orthodox Socialism and Communism has, for certain definite reasons, been far less pronounced in Great Britain than in most of the continental countries. The British Labour party is based directly on the trade unions, which control the overwhelming majority of votes at its conferences. The affiliated Socialist Societies, among which the only body of real importance is the Independent Labour party, with about 50,000 members, are only a tiny fraction of it, and owe their position to energy and readiness to accommodate themselves to circumstances rather than to numbers. The trade unions are not greatly interested in the theoretical disputes of Communists and Social Democrats, and realise the importance of preserving unity for their own practical work. Whereas, therefore, continental Socialist movements have been riven in twain according to the conflicting theories of their individual supporters it has been very hard for Communism to strike root in Great Britain. The Communist party, which has sought but been refused affiliation to the Labour party, has only a few thousand members; and though these conduct, through a so-called "Minority Movement," active propaganda inside the trade unions, they produce relatively little effect. In France, on the other hand, the majority of the pre-War Socialist party went over to Communism, leaving the minority to re-form the Socialist party as a separate body, while in Germany, though the Social Democratic party remains the largest party in the country, the Communists have a really powerful and substantial following.

#### THE INTERNATIONAL MOVEMENT

The rival tendencies in post-War Socialism find expression in two rival Internationals—the Labour and Socialist International, dominated by the continental Right Wing parties and the British Labour party, and the Third, or Communist, International, the organisation of which centres upon the Russian Communist

party. Similarly, there are two trade union Internationals—the Amsterdam International Federation of Trade Unions, to which the British and the majority of the unions in most of the continental countries belong, and the Red International of Labour Unions, which includes the Russians and the "minority movements" of a number of other countries. The Italian movement, almost crushed out by Fascism, and the American, still pursuing a policy of national isolation, stand outside both camps. There have been repeated attempts to promote working-class unity in both the political and the economic sphere; but the conflicts of politics and personalities have so far outweighed the tendencies making for common action, of which the chief is the growing pressure in all capitalist countries, under stress of bad trade and international competition, to lengthen again the working day reduced after the War, and to press down the working-class standard of life.

*Socialism and Politics.*—Socialism everywhere came into effective activity as a movement of working-class revolt, at a time when the impracticability of securing results by parliamentary action and the frequent repression of Socialist propaganda left Socialists no alternative to the adoption of a revolutionary attitude. But gradually these early Socialist bodies won their way to toleration and, commanding a wider influence, took shape as political parties returning a substantial body of members to the various national parliaments. This change led to a marked development of evolutionary Socialist doctrines, in which the achievement of Socialism was envisaged, not catastrophically, but as a gradual transformation of the social order by legislative reforms and as the result of a progressive Socialist conquest of political power. Always there were Socialist groups which repudiated this view (the Syndicalists in France, the Socialist Labour party in America, the Bolsheviks in Russia, the Industrial Unionists in Great Britain); but up to 1914 it appeared to be definitely the growing conception of Socialist policy. It resulted in a placing of the main stress on parliamentary action and on the nationalisation of industry as the means to socialisation of the economic system.

As we have seen, the earlier revolts against this doctrine were mainly industrial movements, designed to turn trade unionism into a revolutionary instrument for the conquest of power and the achievement of workers' control in industry. But after the Russian revolution the Left Wing in the various working-class movements tended to re-cast its policy, and to think in terms, not of a general strike (Syndicalism) or a trade-union advance towards the control of Industry (Guild Socialism), but of a decisive proletarian revolution establishing the dictatorship of a disciplined Communist party. The State and Parliament, which the moderate "Collectivist" Socialists had looked upon as the instruments of social transformation, were denounced as purely capitalist institutions, to be forcibly overthrown and replaced by an exclusively proletarian State as in Russia. This doctrine, clearly enunciated in Marx's Communist Manifesto of 1848, has been most decisively developed by Lenin, the leader of the Russian Bolsheviks (see his *The State and Revolution* and other writings). This tendency to look to revolution, rather than to evolutionary development, as the means of establishing Socialism, has been greatly fostered by the world-wide unloosing of force during the World War, by the apparent success of the method in Russia as compared with the doubtful fortunes of moderate Socialism in Germany and elsewhere, by its employment on the capitalist side in Italy and Spain, and on both sides in Ireland, suggesting that parliamentary decisions will not be obeyed when they cut beyond a certain depth; and by the unsettled condition and uncertain economic prospects of the post-War world. For, whereas before the War it seemed as if the condition of the workers was gradually improving with the general increase in the world's wealth, nowadays the whole economic system is in serious difficulties and the standards of labour appear to be seriously threatened in nearly every country, with only the outstanding exception of the United States.

Yet it would be a profound mistake to regard post-War Socialism as a movement sharply divided into two opposing

factions—revolutionary Communists and parliamentary Collectivists upholding a pacific and constitutional policy. This is indeed the outward form which the struggle often seems to assume. But in every country there are very large groups, far less distinctly organised, which stand at points between the two extremes. Far more important than Communism itself, except in Russia, is the influence on general Socialist thought and policy which not only Communism but also such doctrines as Guild Socialism have undoubtedly exercised. The ordinary trade-union or Socialist party member nowadays, even if he is no Communist, is far less inclined than he was to make constitutionalism a matter of principle, and far more inclined to resort to direct action on a broad basis for the achievement of Socialist, as well as purely immediate economic, ends. This is the result in part of Communism and the Russian revolution, but still more of war experience and changed economic conditions, especially the lessened belief in the stability of the capitalist system and the sincerity of its parliamentary constitutionalism.

#### CHANGES IN THE SOCIALIST PROGRAMMES

Again it may be said that, largely owing to Guild Socialist and Syndicalist influence, the practical Socialist programme has undergone great changes. All schools of Socialists still stand for the transference of large scale industry from private to public ownership; but mere State Socialism, or nationalisation, is no longer a satisfying conception to Socialists of any school. In greater or less degree, all now stand for some form of "workers' control" in socialised industry, and repudiate the idea that industry can be bureaucratically run on any existing civil service model. For example, the British miners, who before the War merely demanded State ownership, now demand as well a substantial share in the control of their industry under public ownership. The French have their plan of "industrial nationalisation," and workers' control appeared prominently in German schemes of socialisation after the War.

*Political Co-operation with non-Socialist Parties.*—It remains to be seen how these changes in doctrine will, in the long run, work out in Socialist political practice. For, while the tendency of Socialist thought and working-class opinion has been on the whole distinctly leftward ever since 1911, there are powerful forces pulling Socialist practice the other way. Especially as, in one country after another, the Socialist parties by constitutional means reach the threshold of political power and increase their parliamentary following, there are strong inducements to disarm opposition and facilitate the assumption of office by the adoption of pacific courses and by compromise or coalition with other parties. In France for example, the Socialists have for some years been in alliance with the Radical parties in a *covet des gauches*, while in Germany they have taken part in Coalition governments with the middle-class parties, and in Great Britain a Labour Govt. held office for nearly a year with Liberal support. These groupings have arisen in all cases out of difficult political situations; and the tendency may well be for such situations to arise even more often in the future. But there is no doubt that the Socialist parties, if under these impulses they moved far to the "Right" into alliance with the "Liberal" groups, would forfeit a substantial part of their working-class support, which would either go over to Communism, or form new political groupings of the "Left" on a more definitely Socialist basis and programme.

*Solidifying Force of Trade Unionism.*—Socialism, then, in 1925, is far nearer than it was in 1911 to the tests of practical experience and responsibility. Naturally, under these conditions, difficulties are more clearly seen, and differences previously latent become more pronounced. But, especially in Great Britain, trade unionism, which is doomed to impotence unless it can transcend these differences and maintain working-class unity, acts as a great solidifying force, and prevents the pushing of quarrels to the point of a split in the political field. And it may be that, elsewhere as well, this need for unity in pursuit of common economic ends will, in the long run, re-unite the warring factions of European Socialism, and achieve a new basis of

political agreement. It would take a bold man to prophesy what the outcome will be. But the tendencies at least are clear enough; and are manifested in every country in which the movement exists at all. And the underlying basis is also clear; for, despite all its transformations and developments, Socialism remains essentially not so much a theoretical plan of social reorganisation as a class movement arising directly out of the economic divisions in society determined by the rise of capitalism and the Industrial Revolution. It is an attempt to formulate for the proletariat a policy designed to promote a more equal distribution and also a larger production of wealth, and to abolish class distinctions based on inequalities of wealth and social opportunity, or on property laws and relations which encourage the accumulation of the means of production in private hands. Its forms and its actual policies may change with the movement of events, thoughts and economic forces; but through all its changes it retains this underlying and essential character, proclaimed by Marx in the Communist Manifesto of 1848,<sup>1</sup> to which formulation the great majority of Socialists still trace the impetus of the movement as a creative social force. By no means all Socialists, especially in Great Britain, call themselves Marxists; but to this extent at any rate the movement as a whole is based firmly on Marx's diagnosis of the social problem (see also COMMUNISM; SECOND INTERNATIONAL; THIRD INTERNATIONAL).

**BIBLIOGRAPHY.**—General. There is no really good account of Socialism as a whole. The handiest text-books in English are W. Sombart, *Socialism and the Social Movement*, tr. by M. Epstein (1909); T. Kirkup, *History of Socialism*, 5th ed., revised by E. A. Pease (1913); The best post-War books, S. and B. Webb, *A Constitution for the Socialist Commonwealth of Great Britain* (1920); J. Ramsay MacDonald, *Socialism, Critical and Constructive* (1921); H. N. Brailsford, *Socialism for To-Day* (1925). R. C. K. Ensor's *Modern Socialism* (1910) is a useful pre-War collection of extracts from the writings of Socialists of all countries. Max Beer's *History of British Socialism*, 2 vol. (1919-20) is indispensable. For the growth of the movement in foreign countries, see the *Labour International Handbook* (1921) and *Supplement* (1923). Other useful books are H. G. Wells, *New Worlds for Old*, rev. ed. (1914); Bertrand Russell, *Roads to Freedom* (1918); G. D. H. Cole, *Guild Socialism Re-stated* (1920).

See also N. Lenin, *The State and Revolution*, Eng. tr. (1919); N. I. Bucharin and E. Preobrazhensky, *The A. B. C. of Communism*, Eng. tr. (1922). The *Communist Manifesto* of K. Marx and E. Engels (1848) should be compared with the new *Communist Manifesto* of the Third International (1919) and with the British Labour Party's *Labour and the New Social Order* (1918). Marxism. K. Marx, *Capital*, Eng. tr. (1907-9), etc. Max Beer, *The Life and Teaching of Karl Marx* (1921); A. D. Lindsay, *Karl Marx's Capital* (1925). There is, of course, a large literature on Socialism in nearly every European language.<sup>2</sup> (G. D. H. C.)

**SOCIALISM: PRINCIPLES AND OUTLOOK**, (see 25301).—Socialism, reduced to its simplest legal and practical expression, means the complete discarding of the institution of private property by transforming it into public property, and the division of the resultant public income equally and indiscriminately among the entire population. Thus it reverses the policy of Capitalism, which means establishing private or "real" property to the utmost physically possible extent, and then leaving distribution of income to take care of itself. The change involves a complete moral *volte-face*. In Socialism private property is anathema, and equal distribution of income the first consideration. In capitalism private property is cardinal, and distribution left to ensue from the play of free contract and selfish interest on that basis, no matter what anomalies it may present.

#### I.

Socialism never arises in the earlier phases of capitalism, as, for instance, among the pioneers of civilisation in a country where there is plenty of land available for private appropriation by the last comer. The distribution which results under such circumstances presents no wider departures from a rough equality than those made morally plausible by their association with exceptional energy and ability at the one extreme, and

<sup>1</sup> Drafted in 1847; published in 1848.

<sup>2</sup> For the contrary case CAPITALISM the article should be consulted

with obvious defects of mind and character or accidental hard luck, at the other. This phase, however, does not last long under modern conditions. All the more favourable sites are soon privately appropriated; and the later comers (provided by immigration or the natural growth of the population), finding no eligible land to appropriate, are obliged to live by hiring it at a rent from its owners, transforming the latter into a *rentier* class enjoying unearned incomes which increase continually with the growth of the population until the landed class becomes a money-lending or capitalist class also, capital being the name given to spare money. The resource of hiring land and spare money is open to those only who are sufficiently educated to keep accounts and manage businesses, most of whom spring from the proprietary class as younger sons. The rest have to live by being hired as labourers and artisans at weekly or daily wages; so that a rough division of society into an upper or proprietary class, a middle or employing and managing class, and a wage proletariat is produced. In this division the proprietary class is purely parasitic, consuming without producing. As the inexorable operation of the economic law of rent makes this class richer and richer as the population increases, its demand for domestic servants and for luxuries of all kinds creates parasitic enterprise and employment for the middle class and the proletariat, not only withdrawing masses of them from productive industry, but also fortifying itself politically by a great body of workers and employers who vote with the owners because they are as dependent on the owners' unearned incomes as the owners themselves.

Meanwhile the competition of employers for custom, which leads to the production of a dozen articles to satisfy the demand for one, leads to disastrous crises of feverish overproduction alternated with periods of bad trade ("booms" and "slumps"); making continuous employment of the proletariat impossible. When wages fall to a point at which saving also is impossible, the unemployed have no means of subsistence except public relief during the slumps.

It is in this phase of capitalistic development, attained in Great Britain in the 19th century, that socialism arises as a revolt against a distribution of wealth that has lost all its moral plausibility. Colossal wealth is associated with unproductiveness, and sometimes with conspicuous worthlessness of character; and lifetimes of excessive toil beginning in early childhood leave the toiler so miserably poor that the only refuge left for old age is a general workhouse, purposely made repulsive to deter proletarians from resorting to it as long as they have strength enough left for the most poorly paid job in the labour market. The inequalities become monstrous: hardworking men get four or five shillings a day (post-War rates) in full view of persons who get several thousands a day without any obligation to work at all, and even consider industrial work degrading. Such variations in income defy all attempts to relate them to variations in personal merit. Governments are forced to intervene and readjust distribution to some extent by confiscating larger and larger percentages of incomes derived from property (income tax, supertax, and estate duties) and applying the proceeds to unemployment insurance and extensions of communal services, besides protecting the proletariat against the worst extremities of oppression by an elaborate factory code which takes the control of workshops and factories largely out of the hands of their proprietors, and makes it impossible for them to exact grossly excessive hours of labour from their employees or to neglect their health, physical safety, and moral welfare with complete selfishness.

This confiscation of private property incomes for public purposes without any pretence of compensation, which is now proceeding on a scale inconceivable by Victorian ministers, has destroyed the integrity of private property and inheritance; and the success with which the confiscated capital has been applied to communal industries by the municipalities and the central Government, contrasted with the many failures and comparative costliness of capitalist industrial adventure, has shaken superstition that private commercial management is

always more effective and less corrupt than public management. In particular, the British attempt to depend on private industry for munitions during the War of 1914-8 nearly led to defeat; and the substitution of national factories was so sensationally successful, and the post-War resumption of private enterprise, after a brief burst of illusory prosperity, was followed by so distressing a slump, that the reversal of the relative efficiency prestige of socialism and capitalism was vigorously accelerated, leaving capitalism unpopular and on the defensive, whilst confiscation of private capital, communal enterprise, and nationalisation of the big industries, grew steadily in popularity in and out of Parliament.

This change in public opinion had already deeply penetrated the middle class, because of the change for the worse in the position of the ordinary employer. He, in the 19th century, was admittedly master of the industrial, and, after the Reform of 1832, of the political situation. He dealt directly and even domineeringly with the proprietary class, from which he hired his land and capital either directly or through agents who were his servants and not his masters. But the sums required to set on foot and develop modern industrial schemes grew until they were out of reach of ordinary employers. The collection of money to be used as capital became a special business, conducted by professional promoters and financiers. These experts, though they had no direct contact with industry, became so indispensable to it that they are now virtually the masters of the ordinary routine employers. Meanwhile the growth of joint-stock enterprise was substituting the employee-manager for the employer, and thus converting the old independent middle class into a proletariat, and pressing it politically to the left.

With every increase in the magnitude of the capital sums required for starting or extending large industrial concerns comes the need for an increase in the ability demanded by their management; and this the financiers cannot supply: indeed they bleed industry of middle class ability by attracting it into their own profession. Matters reach a point at which industrial management by the old-fashioned tradesman must be replaced by a professionally trained and educated bureaucracy; and as Capitalism does not provide such a bureaucracy, the industries tend to get into difficulties as they grow by combination (amalgamation), and thus outgrow the capacity of the managers who were able to handle them as separate units. This difficulty is increased by the hereditary element in business.

An employer may bequeath the control of an industry involving the subsistence of thousands of workers, and requiring from its chief either great natural ability and energy or considerable scientific and political culture, to his eldest son without being challenged to prove his son's qualifications, whilst if he proposes to make his second son a doctor or a naval officer he is peremptorily informed by the Government that only by undergoing an elaborate and prolonged training, and obtaining official certificates of qualification, can his son be permitted to assume such responsibilities. Under these circumstances, much of the management and control of industry gets divided between routine employers who do not really understand their own businesses, and financiers, who, having never entered a factory nor descended a mine shaft, do not understand any business except the business of collecting money to be used as capital, and forcing it into industrial adventures at all hazards, the result being too often reckless and senseless over-capitalisation, leading to bankruptcies (disguised as reconstructions) which reveal the most astonishing technical ignorance and economic blindness on the part of men in high repute as directors of huge industrial combinations, who draw large fees as the remuneration of a mystical ability which exists only in the imagination of the shareholders.

## II.

All this steadily saps the moral plausibility of capitalism: The loss of popular faith in it has gone much further than the gain of any widespread or intelligent faith in socialism. Consequently the end of the first quarter of the 20th century finds the political

situation in Europe confused and threatening: all the political parties diagnosing dangerous social disease, and most of them proposing disastrous remedies. National governments, no matter what ancient party slogans they raise, find themselves controlled by financiers who follow the slot of gigantic international usuries without any public aims, and without any technical qualifications except their familiarity with a rule-of-thumb city routine quite inapplicable to public affairs, because it deals exclusively with stock exchange and banking categories of capital and credit. These, though valid in the money market when conducting exchanges of future incomes for spare ready money by the small minority of persons who have these luxuries to deal in, would vanish under pressure of any general political measure like—to take a perilously popular and plausible example—a levy on capital. Such a levy would produce a money market in which there were all sellers and no buyers, sending the Bank Rate up to infinity, breaking the banks, and bringing industry to a standstill by the transfer of all the cash available for wages to the national treasury. Unfortunately the parliamentary proletarian parties understand this as little as their capitalist opponents. They clamour for taxation of capital; and the capitalists, instead of frankly admitting that capital as they reckon it is a phantom, and that the assumption that a person with an income of £5 a year represents to the state an immediately available asset of £100 ready money, though it may work well enough as between a handful of investors and spendthrifts in a stockbroker's office, is pure fiction when applied to a whole nation, ignorantly defend their imaginary resources as if they really existed, and thus confirm the proletariat in its delusion instead of educating it.

The financiers have their own *ignis fatuus*, which is that they can double the capital of the country, and thus give an immense stimulus to industrial development and production, by inflating the currency until prices rise to a point at which goods formerly marked £50 are marked £100, a measure which does nothing nationally but enable every debtor to cheat his creditor, and every insurance company and pension fund to reduce by half the provision for which it has been paid. The history of inflation in Europe since the War of 1914-8, and the resultant impoverishment of pensioners and officials with small fixed incomes, forces the middle classes to realise the appalling consequences of abandoning finance and industry direction to the unskilled, politically ignorant, unpatriotic "practical business men."

Meanwhile, the mobility of capital leads to struggles for the possession of exploitable foreign territories ("places in the sun") produces war on a scale which threatens not only civilisation but human existence; for the old field combats between bodies of soldiers, from which women were shielded, are now replaced by attacks from the air on the civil population, in which women and men are slaughtered indiscriminately, making replacement of the killed impossible. The emotional reaction after such wars takes the form of acute disillusion, which further accelerates the moral revolt against capitalism, without unfortunately, producing any workable conception of an alternative. The proletarians are cynically sulky, no longer believing in the disinterestedness of those who appeal to them to make additional efforts and sacrifices to repair the waste of war. The moral mainspring of the private property system is broken; and it is the confiscations of unearned income, the extensions of municipal and national communism, above all, the new subsidies in aid of wages extorted from governments by threats of nationally disastrous lock-outs and strikes, which induce the proletariat to continue operating the capitalist system now that the old compulsion to work by imposing starvation as the alternative, fundamental in capitalism, has had to be discarded in its primitive ruthlessness. The worker who refuses to work can now quarter himself on public relief (which means finally on confiscated property income) to an extent formerly impossible.

Democracy, or votes for everybody, does not produce constructive solutions of social problems; nor does compulsory schooling help much. Unbounded hopes were based on each successive extension of the electoral franchise, culminating in the enfranchisement of women. These hopes have been dis-

appointed, because the voters, male and female, being politically untrained and uneducated, have (a) no grasp of constructive measures, (b) loathe taxation as such, (c) dislike being governed at all, and (d) dread and resent any extension of official interference as an encroachment on their personal liberty. Compulsory schooling, far from enlightening them, inculcates the sacredness of private property, and stigmatises a distributive state as criminal and disastrous, thereby continually renewing the old public opinion against socialism, and making impossible a national education dogmatically inculcating as first principles the iniquity of private property the paramount social importance of equality of income and the criminality of idleness.

Consequently, in spite of disillusion with capitalism, and the growing menace of failing trade and falling currencies, our democratic parliamentary Oppositions, faced with the fact that the only real remedy involves increased taxation, compulsory reorganisation or frank nationalisation of the bankrupt industries, and compulsory national service in civil as in military life for all classes, dare not confront their constituents with such proposals, knowing that on increased taxation alone they would lose their seats. To escape responsibility, they look to the suppression of parliamentary institutions by *coups d'état* and dictatorships, as in Italy, Spain and Russia. This despair of parliamentary institutions is a striking novelty in the present century; but it has failed to awaken the democratic electorates to the fact that, having after a long struggle gained the power to govern, they have neither the knowledge nor the will to exercise it, and are in fact using their votes to keep Government parochial when civilisation is bursting the dikes of nationality in all directions.

A more effective resistance to property arises from the organisation of the proletariat in trade unions to resist the effect of increase of population in cheapening labour and increasing its duration and severity. But trade unionism is itself a phase of capitalism, inasmuch as it applies to labour as a commodity that principle of selling in the dearest market, and giving as little as possible for the price, which was formerly applied only to land, capital and merchandise. Its method is that of a civil war between labour and capital in which the decisive battles are lock-outs and strikes, with intervals of minor adjustment by industrial diplomacy. Trade unionism now maintains a Labour party in the British Parliament. The most popular members and leaders are socialists in theory; so that there is always a paper programme of nationalisation of industries and of banking, taxation of unearned incomes to extinction, and other incidentals of a transition to socialism; but the trade union driving force aims at nothing more than capitalism with labour taking the lion's share, and energetically repudiates compulsory national service, which would deprive it of its power to strike. In this it is heartily seconded by the proprietary parties, which, though willing enough to make strikes illegal and proletarian labour compulsory, will not pay the price of surrendering its own power to idle. Compulsory national service being essential in socialism, it is thus deadlocked equally by organised labour and by capitalism.

It is a historic fact, recurrent enough to be called an economic law, that capitalism, which builds up great civilisations, also wrecks them if persisted in beyond a certain point. It is easy to demonstrate on paper that civilisation can be saved and immensely developed by, at the right moment, discarding capitalism and changing the private property profiteering state into the common property distributive state. But though the moment for the change has come again and again it has never been effected, because capitalism has never produced the necessary enlightenment among the masses, nor admitted to a controlling share in public affairs the order of intellect and character outside which Socialism, or indeed politics, as distinguished from mere party electioneering, is incomprehensible. Not until the two main tenets of socialism: abolition of private property (which must not be confused with personal property), and equality of income, have taken hold of the people as religious dogmas, as to which no controversy is regarded as sane, will a stable socialist state

be possible. It should be observed, however, that of the two tenets, the need for equality of income is not the more difficult to demonstrate, because no other method of distribution is ever has been possible. Omitting the few conspicuous instances in which actual earners of money make extraordinary fortunes by exceptional personal gifts or strokes of luck, the existing differences of income among workers are not individual but corporate differences. Within the corporation no discrimination between individuals is possible; all common labourers, like all upper division civil servants, are equally paid. The argument for equalising the class incomes are that unequal distribution of purchasing power upsets the proper order of economic production, causing luxuries to be produced on an extravagant scale whilst the primitive vital needs of the people are left unsatisfied; that its effect on marriage, by limiting and corrupting sexual selection, is highly dysgenic; that it reduces religion, legislation, education and the administration of justice to absurdity as between rich and poor; and that it creates an idolatry of riches and idleness which inverts all sane social morality.

Unfortunately, these are essentially public considerations. The private individual, with the odds overwhelmingly against him as a social climber, dreams even in the deepest poverty of some bequest or freak of fortune by which he may become a capitalist, and dreads that the little he has may be snatched from him by that terrible and unintelligible thing, state policy. Thus the private person's vote is the vote of Ananias and Sapphira; and democracy becomes a more effective bar to socialism than the pliant and bewildered conservatism of the plutocracy. Under such conditions the future is unpredictable. Empires end in ruins: commonwealths have hitherto been beyond the civic capacity of mankind. But there is always the possibility that mankind will this time weather the cape on which all the old civilisations have been wrecked. It is this possibility that gives intense interest to the present historic moment, and keeps the Socialist movement alive and militant. (G. B. S.\*)

**SOCIAL SERVICE** (see CHARITIES, 5,860).—In the modern state many social services are maintained by statutory authorities, and in Great Britain the term public social services has become a current phrase in official reports; nevertheless social service is still commonly understood as referring to voluntary work, and in this sense is employed in the present article.

**Public Health.**—In the field of public health voluntary agencies have done and are doing much to stimulate and support the work of public health authorities by the creation of enlightened public opinion through propaganda and the organisation of health exhibitions, demonstrations, etc. In Great Britain bodies like the National Council for Combating Venereal Disease and the National League for Health, Maternity and Child Welfare are largely responsible for the growth of public opinion which has made possible the recent expansion of statutory services (see VENEREAL DISEASES).

In the United States voluntary bodies such as the American National Red Cross, American Public Health Assn., American Social Hygiene Assn. and National Child Health Council, National Committee for Mental Hygiene and the National Organisation for Public Health Nursing (see NURSING) are having a similar educative effect on public opinion. In connection with housing and town-planning and other public health services, pioneer work and the formation of public opinion are characteristic tasks for voluntary initiative. Much modern social legislation presupposes for its effectiveness the willing co-operation of the individual citizen, and an extension of the voluntary spirit of service can alone secure this.

**Education.**—The task of voluntary agencies in education is narrowed by the development of public systems of compulsory education, but an extension of adult education (*q.v.*) is particularly the field of voluntary effort. Not the least remarkable development of adult education in recent years is the rapid growth of a system of voluntary education in British prisons, which owes its achievement to a large band of men and women who undertake the work of teaching in their spare time. There are other fields in which a similar activity is shown.

**Industry.**—The growth of the industrial welfare movement is opening up new opportunities for co-operation between employers and employed in the development of better social facilities, and offers a new career for those who desire to take up social work as a profession. Systems of vocational selection for young people leaving school and schemes for their after-care, which are being evolved particularly in Great Britain and the United States, owe much to the pioneer experiments of voluntary societies, and even as they become stereotyped as state services they are likely to depend for their effectiveness on the voluntary workers associated with the public authority in their administration.

**Recreation.**—Provision for recreation and opportunities for a good use of leisure are being recognised as of increasing importance, in view of the movement to reduce working hours. A strong public opinion on such matters as the need for open spaces and playing fields has still to be created in many countries. The formation of the National Playing Fields Assn. in Great Britain is evidence of progress, but the United States is ahead of any other country in this matter, development there being due largely to the pioneer work of the Playground and Recreation Assn. and other voluntary associations with similar aims. The work of juvenile organisations such as the Boys Brigade, Church Lads Brigade, Boy Scouts (*q.v.*), Girl Guides (*q.v.*), Camp Fire Girls and of Boys' and Girls' Clubs is profoundly important in this connection, for they provide training in the use of leisure at a time when, the discipline of school being lately removed, it is most needful. Such bodies as the English Folk Dance Society in Great Britain and the Music School Settlements in the United States and others promoting choral singing, dramatics and the practice of arts and crafts perform social services which are of great value, for the line between education and recreation cannot be drawn clearly.

#### THE TREND OF RECENT DEVELOPMENTS

Unlike services provided under statute and administered under regulations, voluntary social service is essentially dynamic. It derives not from authority but from personal conviction, and while particular societies may stagnate and fail even to keep pace with the progress of knowledge, it is nevertheless generally true that progress in social provision is mainly due to voluntary effort which is the pioneer force, constantly experimenting with new methods and breaking fresh ground.

The modern interest in prevention rather than cure is very noticeable, and is coupled with a new sense of "community." The younger generation of those who are prepared to work for social betterment are inclined to think in terms of the community rather than of the individual; they are anxious to improve the conditions and quality of the social life in the community of which they are members; they want to work not *for*, but *with* their neighbours; they are less interested in "mopping up social messes" than in preventing them.

The quickened sense of community which resulted from concentration on "national" needs during the World War has given new impetus to the movement for voluntary social service with society rather than the individual as its objective. The attention given to "community organisation" in the United States is an outstanding illustration of the new spirit. The 100,000 voluntary workers for the National Savings Movement in Great Britain are one example of the new forces which it is enlisting.

This change of emphasis which is closely allied with current tendencies in the development of political ideals, is impressing itself on the institutions of voluntary social service. Already two distinct types of voluntary agency are clearly distinguishable, although a great many occupy a middle position. There is, first, the older type of social service typified by relief societies and orphanages, established to meet the special needs of particular individuals in distress. Secondly there is a newer type of association aiming at the corporate self-development of a membership which is united by common interests and is selective only in that sense. Eligibility for membership is not dependent on need, but on the desire to join in a common endeavour and a willingness to accept a common rule.

*Ex-service Societies.*—Every former war produced voluntary societies to care for the needs of ex-service men in distress and the recent war is no exception: but whereas in former wars such societies have been of the older type, this time it is the ex-service men and women who have banded themselves together to help themselves. The British Legion had in Jan. 1926 a membership of approximately 1,000,000. Its work is, broadly speaking, twofold. On the one hand it raises vast sums by public appeal and other means for the relief of distress among ex-service men and women, and it provides them with a powerful advocate where their claim to public provision is in question. On the other hand the legion also aims at securing for its members the facilities for a good social life, through the organisation of clubs and institutions, provision for education, etc. Here is a case in which (1) the old philanthropic work is carried on by a body which is organised on democratic lines and which combines with it (2) the positive task of providing social amenities for its members. Similar bodies of ex-service men are to be found in practically every other belligerent country, and all have a wider social purpose than the mere protection of self interest.

*Rotary Clubs and Women's Institutes.*—There are an increasing number of voluntary organisations, doing work of great value, which are not specifically, or at least primarily, formed for that end. The Rotary movement which is rapidly developing throughout the English-speaking world is a case in point, but an even more effective illustration is provided by the growth of post-War organisation among rural women. Starting in Canada, the Women's Institute movement under various names has grown with remarkable pace in Great Britain since the War. It is a landing together of women to secure the conditions for a better social life, not for themselves only, but for the whole rural community. The institutes are not only concerned with their own education, etc., but are increasingly interesting themselves in the social services of the villages. In this case the movement makes no appeal to philanthropy; in its early days its organisation was subsidised from state funds, but less has been needed each year as the movement grew and it is now (Dec. 1925) very nearly self-supporting, with a membership of some 206,000 representing every class of countrywomen.

*Finance.*—In the past voluntary work was financed entirely from the gifts of the charitable—donations, subscriptions or endowments, and much is still financed in this way; but two other possible sources of income are now available and both are attributable to the developments which have been noted. They are (a) membership fees and money raised by the corporate efforts of members—the more completely democratic is the organisation the larger will be the proportion of total income from this source—and (b) grants-in-aid from public funds. In Great Britain and in some other countries, co-operation between public authorities and voluntary agencies is not only personal but financial. It is difficult to estimate the ultimate effect of this development. Acceptance of grant-aid must involve the acceptance of some measure at least of regulation, and freedom is the very life of voluntary enterprise—dependence on public aid may prove as damaging to the morale of an association as it is to an individual. There is great social value in the enthusiasm, faith and self-sacrifice which are expressed in the accounts of voluntary associations, where every shilling represents a voluntary contribution of someone whose interest and sympathy have been enlisted.

Nevertheless provisions in social legislation for the grant-aid of voluntary work marks a growing recognition of its importance to the community and a growing sense of community responsibility. Two significant developments are (1) the adoption of what are known as "contributory schemes of finance" by the voluntary hospitals of Great Britain, and (2) the growth of systems of "central financing" in the United States.

*Hospital Schemes.*—The hospital scheme expresses a voluntary assumption of financial responsibility for hospital finance by a large proportion of the community of potential beneficiaries and others interested in their social welfare; it involves a widespread organisation of local representative committees and is resulting in a co-ordination of hospital and allied services in dis-

tricts where the scheme is well developed. For as soon as community responsibility is accepted the isolated and completely independent position of a voluntary association ceases to be allowable; co-ordination with other bodies and other services becomes an obvious necessity (see HOSPITALS).

*Central Financing.*—In the American schemes for "central financing" this need for co-ordination is fully recognised, and advocates of the system attach great importance to the co-operative programme and budget-making which are involved. All the voluntary agencies in a town draw up their programmes and budgets for the coming year. These are then carefully co-ordinated by a central, representative organisation. After this has been done, one organised appeal is made for the total sum required (popularly known as the "chest")—the appeal being based on the whole programme of social effort for the community which is expressed in the combined programmes of the several participating agencies. It is demonstrable that in the first few years that followed the adoption of the system substantial increases were secured in (1) the amount raised and (2) the number of individual contributors. The new plan is making headway in spite of much criticism and some hostility. Clearly it may save a waste of time and valueless competition between agencies, it may result in a better understanding of a community's needs and a wider acceptance of responsibility; but it may also tend to impair the freedom of purpose and of action of the constituent agencies. The constitution of the co-ordinating body is vitally important. Representatives of the participating agencies on one hand and of the contributors on the other, each claim a voice in the programme-shaping; at present there is considerable variety in the local organisation of the system and the "balance of power" varies in different cities. The trend of the movement is, however, unmistakably towards safeguarding the initiative and responsibility of the participating agencies. "The basic motive of central financing," say its advocates "is not the mere establishment of a better financial method, but the promotion of a definite community purpose."

Thus the effect of a new outlook on the older type of voluntary agency is reflected in their acceptance of public grants in aid and of the "regulation" which goes with these, in the organisation of a contributory membership (in the case of British hospitals) and their increased willingness to combine in co-operative organisation and to co-ordinate their work with that of other bodies.

### THE COMMUNITY SPIRIT

The movement to develop co-operation between social service agencies reflects the same growth of a community spirit. It is beginning to be recognised in the United States and in Great Britain that a council of social agencies, a council of social service, or of social welfare—the name is immaterial—is essential to effective work. Statutory authorities and voluntary agencies cover much ground but in the absence of any provision for systematic collaboration or "team work" they often ignore each other's activities and their efforts overlap or leave gaps unfilled. To secure the pooling and exchange of knowledge and concerted action a body representative of all agencies at work in a single locality is required, and it is to meet this need that these councils are being established. They are in the main consultative and advisory, but there are certain tasks which they are specially qualified to undertake on behalf of all their constituent bodies. The representative character of a council of social service ensures ready access to information in possession of all its constituent bodies, and its office is therefore a centre where reliable information is easily obtainable by every inquirer. The maintenance of a careful survey of social need and social provision is, further, a distinctive task which is best undertaken by a body qualified by its constitution to survey the whole field.

In Great Britain this movement is not confined to towns, but is expressed in the community councils which are being formed in country areas. Its extension is the task of a national council of social service (Incorporated) on which the principal government departments and voluntary organisations of a national scope are represented. In the United States the National Social Work

Council and other important bodies are working for similar ends, and the annual meetings of the National Conference of Social Work have done much, during the past 50 years, to spread co-operation and breadth of outlook among social service workers in the States and in Canada. In this connection reference must be made to the work of an increasing number of Trusts established by private benefactors for the promotion of social welfare. With a wide vision of their opportunities such bodies as the Russell Sage Foundation in the United States and the Carnegie United Kingdom Trust in Great Britain (to mention only two) are doing much to emphasise the inter-relation of different branches of work, both by direct action and by the assistance which they give to other voluntary bodies as agents in a carefully evolved programme.

*Training of Social Workers.*—The standard of technical equipment required of social workers has greatly increased as social services have grown and become more elaborate and as the sense of community responsibility supersedes satisfaction with haphazard and comparatively uninformed tinkering. A demand for scientific method in social work has led to the establishment of special training schools and of special departments in connection with universities, in Great Britain, United States, Belgium, Chile, Czechoslovakia, Finland, France, Germany, Italy, Netherlands, South Africa, Sweden and Switzerland.

In these a study of the social sciences is usually combined with that of particular problems and some practical work in connection with local agencies and institutions. Allied to this demand for training is the increased attention that is being given to research and the study of social problems—a work in which several of the Trusts referred to above are playing a valuable part.

*International Co-operation.*—Not only does the number of international conferences on social questions increase year by year, but several voluntary movements now function on an international scale. The ex-service men's organisations referred to above have their international federation—both the Y.M.C.A. and the Y.W.C.A. have an international organisation and work in many lands. The same is true of the Red Cross societies. In this international work national prejudices are forgotten in a common desire to learn all that may help from the experience of others. A quickening of the social conscience in hitherto backward countries owes much to such international contacts.

The limits of social service are not easy to define. The time is coming when the social purpose of industry and other pursuits will be more generally recognised, and clearly many of the problems with which social service is concerned cannot be solved independently of these. It is of vital importance to any nation that the search for solutions should be resolutely pursued and in that search the voluntary spirit is the most powerful agent. If this be so the tendencies which have been noted are encouraging. (See also BLIND; BOY SCOUTS; CHILD WELFARE; GIRL GUIDES; HOSPITALS; MATERNITY; WHITE SLAVE TRAFFIC; etc.)

**BIBLIOGRAPHY.**—M. E. Richmond, *Social Diagnosis* (Russell Sage Foundation, 1917); C. R. Attlee, *The Social Worker* (1920); J. J. Findlay, *An Introduction to Sociology* (1920); R. M. Maciver, *The Elements of Social Science* (1921); E. T. Devine, *Social Work* (1922); S. A. Queen, *Social Work in the Light of History* (1922); F. W. Blackmar and J. L. Gillin, *Outlines of Sociology* (rev. ed., 1923); J. H. Tufts, *Education and Training for Social Work* (Russell Sage Foundation, 1923); E. Macadam, *The Equipment of the Social Worker* (1925).

**SOCIOLOGY** (see 25.322).—No comprehensive presentment of social science having, as yet, obtained general recognition, a detached survey of the sociological field must needs follow the lines of the leading schools, and of individual writers most widely influential or significant.

#### THE SEVERAL SCHOOLS OF THOUGHT

Up to 1914 the two most representative schools were (a) of Durkheim, essentially following the tradition of Auguste Comte, who founded sociology by the publication of his *Philosophie Positive* during the years 1830-42; and (b) of De Tourville and Demolins, following the tradition of Frédéric Le Play, who, independently of Comte, and without reference to his work,

founded the more concrete and observational side of sociology, especially by monographic publication of his *Les Ouvriers Européens*, from 1855 onwards.

*Durkheim.*—Both these schools suffered an arrest during the World War; but the organ of the Durkheim school, *L'Année Sociologique* recommenced publication in 1925, and on the same plan as previously, but edited by Marcel Mauss in place of Durkheim, who died in 1917. The scheme of the *Année* is to publish each year a series of studies by members of the school, and also an analysis and epitome of the more important writings produced in general sociology and in each of the main specialisms within the sociological field. The *Année* selects and epitomises relevant advances in economics, political philosophy, ethics, jurisprudence, criminology, social geography, anthropology, social psychology, demography, comparative religion, aesthetics, etc. This comprehensive survey and abstract makes a file of the *Année* an invaluable requisite of the serious student, whether of general or specialised interest.

*Le Play.*—The organ of the Le Play school (*La Science sociale*) had a different purpose. While the approach of Comte was primarily logico-mathematical, biological, historical and interpretative, that of Le Play was from physical science and industry, with direct observation, especially through travel, first of representative working-class families, by means of family budgets, and next of their actual living communities: and especially of the fundamental nature occupations; all studied at first hand in their environment, and in their resulting social organisation, with its characteristic ideas and ideals. Hence have been published in *La Science sociale* a long series of social monographs, in contribution to the geographico-social study of communities as they develop from their simple origins and isolated situations towards complex cultures interacting to form our historic civilisations. This line of treatment has been more akin to the naturalistic and descriptive attitude of Balzac and later realist French literature than to the abstractly philosophic, or the strictly anthropological, historical, or psychologic treatments of other schools, and so has elicited, as yet, too little appreciation in the run of current sociology.

A third group of active sociologists in France is that associated with the Institut International de Sociologie, with its periodic congresses and its *Revue internationale de sociologie*, ably edited by René Worms until his death in 1926.

The two formative French schools, continuing and developing the initial impulses of their respective founders, are manifestly complementary. But owing to the sharp division in France between the traditions of the revolution and of the counter-revolution, to which the doctrines of Comte and of Le Play respectively first appealed, these have, unfortunately for the progress of science, run independent courses, with little or no inter-penetration. Except for a book by Paul Bureau (*Introduction à la Méthode sociologique*, Paris, 1923), no serious attempt seems as yet to have been made in France to integrate their respective methods and products.

*The Work of Geddes.*—But a third school, initiated in Edinburgh about 1890 by Patrick Geddes has laboured continuously towards uniting and developing both these main French traditions, view-points and methods; more especially by applying the characteristic methods of each towards studying the evolution of cities and their regions. For this school it is living cities and their regions which most fully offer to the scientific student, as well as to the plain man, the directly observable aspects of civilisation. And if, along with direct observation, there is afforded, as by this synthetic school, a historic and contemporary interpretation which utilises the available specialised knowledge, then does the student of cities attain towards that complex unity of presentment which sociology demands. To this end has been developed, and largely in harmony with the Le Play school, the characteristic method now widely known as regional and civic survey; such surveys emanating from this group, with their pragmatic motto of "vivendo discimus," have been experimentally applied in Great Britain, France, India, Palestine, etc., towards regional improvement and in city and university design. With these

practical endeavours should also be appreciated the advances made by social workers in almost all countries, for their labours contribute, if not always immediately, yet indirectly, to the progress of social science.

This survey method is being increasingly applied as the preliminary inquiry requisite for town-planning, in its later developments known as regional. It is also being adopted in schools as an introduction to social studies made by direct observation in the open air along with nature studies, or as sequels to these. But these educational and civic applications alike too often lack the systematic and synthetic character essential to a scientific handling of sociological issues.<sup>1</sup>

*Importance of Interconnection.*—From the unified standpoint of the preceding schools the most generalised conception for the upbuilding of a science of sociology is that of the essential interconnection of all main aspects of any given community and its civilisation. Its situation in place, its actual industries and everyday work, and its people of all classes, with their common sense and experience, their ordinary feelings of selves and family, are all intimately connected with their ideas, social and political, with their scientific interests and aesthetic preferences and even with the religion and the philosophy of their own times as well as of earlier phases. But this view of social interaction is not to be confused with the too simple "economic determination of history" so emphasised by and since Marx; for the economic processes of each place and age are seen by the sociologist to be deeply influenced, often even determined, by preceding as well as current ideas and ideals; so that constant interaction is ever going on between the "temporal and spiritual" forces in every society. The actions and reactions of all these social factors in functional interplay thus produce the general and working "consensus" essential to each given community, in its characteristic phase and main level of civilisation; with its current and predominant "representation of life" accordingly.

*The Social Heritage.*—Changes in all these aspects of a civilisation, however, arise, even from generation to generation (especially when stimulated by great events), and still more from age to age, with their correspondingly fresh phases, and with variations, both objective and subjective, each modifying the other. Yet despite all such changes of the social consensus in its functionings and institutions and of representation of life accordingly, there is always traceable a definite continuity, even of "filiation," with the preceding phases, however great the seeming contrast. The outcome of these complex interactions is an unmistakable social inheritance. Above and beyond biological heredity there exists therefore a characteristic social heritage (and its associated burden of evil) which, by differentiating human from animal societies, constitutes the essential subject matter of sociology. And of this heritage, cities and their regions are more than the repositories. They are essentially concerned in transmitting it from generation to generation, and in modifying, for better or worse, its volume, character and purpose. It follows that the regional and civic survey, as a means of scientific advance, must develop a technique for study, at once observational and systematic, of the social heritage, in its past, present and incipient phases.<sup>2</sup>

<sup>1</sup>For the principles requisite to a systematic presentation see papers by Geddes, in *Sociological Papers*, vol. 1, 2, 3 and in *The Sociological Review* of 1925 (Le Play House Press, 65 Belgrave Road, London). For an elementary account, prepared for social workers and studious citizens, see *Introduction to Regional Surveys*, by Sybella Branford and Alexander Farquharson (Le Play House Press). Later developments of the method, and many applications to theoretical studies and practical questions, will be found in *The Sociological Review*, the organ of the (British) Sociological Society. Amongst characteristic books of the same school, of more general treatment, may be mentioned *The Coming Polity* (revised edition 1919), and our *Social Inheritance* (1919), both by V. Branford and P. Geddes, and *Cities in Evolution* (1915), by P. Geddes and *Science and Sanctity* (1923), by V. Branford. For the relation of sociology to biology, as viewed by this school, see *Biology* by P. Geddes and J. A. Thomson in the Home University Library, London.

<sup>2</sup>For a set of formulae adjusted to this purpose see, in addition to the papers by Geddes already mentioned, *Our Social Inheritance* by Branford and Geddes, Part I.

The preceding outline indicates the needed and practical utilisation alike of Le Play's teaching and Comte's, along with that of other writers, respectively observant and interpretative, concrete or abstract. All are needed, and all require fuller co-ordination; and for this purpose, no doubt, revision. Thus Comte's classification of the sciences as essentially physical, biological and social, and his famous "law of the three states" (as successively theological and military, metaphysical and political, positive and industrial; or, as John Stuart Mill summed them, volitional, abstractional and scientific), have been absorbed into the body of social thought more fully than is commonly realised; yet each of these master concepts demands fuller inquiry, with consequent restatement.

So too Le Play's essential formula of "place, work and folk," though necessary for the correlation of geographic, economic, anthropological and social inquiries, calls for elaboration. The other basal contribution of Le Play and his continuators comes from their insistence on, and treatment of, the primary occupations. Gathering and hunting, herding and cultivating, mining, woodcraft and fishing—all these are viewed as elemental types of adaptation between man and nature, each definitely related to given environments, and together in their unity composing a rich rural matrix, from which urban civilisations have issued, and are perennially renewed, developed, arrested or degraded, according as, under more or less urbanised conditions, the characteristic traits and dispositions of the original rural types persist and undergo modifications towards progress, reversion or perversion.

From this presentment of elemental social types and their interplay for good and evil, arises a "natural history" of civilisations, which goes far beyond the superficial handling of the fundamental occupations by early economists and anthropologists. Yet, mainly perhaps by lack of detailed reference and specific instance, this Le Play doctrine of social evolution and regression has, so far, failed to win recognition from the specialised investigators of current economics and anthropology.

*Place, Work, Folk.*—The three primary social factors of place, work, folk, so insisted on by the Le Play school, correspond, term for term, with the primary biological concepts of environment, function, organism. Hence the possibility of a sociology concentrated on the social heritage and its progress, arrest or perversion, in social life, yet definitely correlated with biology and presenting the social process as not only continuous with the organic and individual life-processes, but increasingly transcending these. In all human communities, progress is thus seen to consist essentially in an orderly and rational modification and even transformation, of environment, through those kinds of work, *i.e.*, occupation up to its widest sense, which give expression to composite ideals at once social and individual, rural and urban.

Amongst various endeavours towards such a sociology, *i.e.*, continuous with biology but utilising as fully as may be the resources of philosophy, of psychology, history and all other relevant specialisms, that of Geddes and his fellow-workers starts from the more naturalistic and geographical approach; and that of L. T. Hobhouse sets out from a more strictly humanistic standpoint, psychologic and philosophic. Hobhouse's main works are *Mind in Evolution* (1915); *Morals in Evolution* (1923); and the following four books, together constituting the author's *Principles of Sociology*, viz.: *Metaphysical Theory of the State* (1918); *The Rational Good* (1921); *The Elements of Social Justice* (1921); and *Social Development* (1923).

*Specialised Approaches.*—As a notable instance of the many contributions towards a general sociology, at once naturalistic and humanistic, starting from anthropology, may be especially mentioned the works of Professor Westermarck. His classic *History of Human Marriage*, many times revised, was followed by *Origin and Development of Moral Ideas* (2nd ed., 1917), and other works. Amongst other advances in England from anthropology towards sociology may be cited those of Rivers, Haddon, Marett, Myers, Peake, Fleure, Seligman, Crawford, Elliot Smith, Perry and Malinowski. A similar list could be compiled, for other countries, of anthropologists moving, deliberately or uncon-

sciously, towards a general sociology. And the same, in less degree, is true of psychologists, economists, historians, geographers and other specialised groups. But all these regiments of sociologists, actual or would-be, are too inclined to march independently of each other, and without guidance from the synthetic concepts and co-ordinating methods grown up in the central tradition of the main science.

#### WORK IN VARIOUS COUNTRIES

*United States.*—In contrast to the surviving indifference to sociology on the part of British universities (with the conspicuous exception of London), those of the United States have mostly established chairs, sometimes even departments. From this American source issues a copious stream of literature, mainly text books for students, but also more considerable works, both methodological and of comprehensive range. Lester Ward, the American pioneer of sociology before its academic adoption, Giddings, Albion Small, E. A. Ross, Ellwood, Vincent, Cooley, Barnes and many younger writers have produced notable works.

Yet American sociology suffers from inadequate relation to the twofold French beginnings of the science and to the developments which have grown up out of these historic initiatives. This lack of continuity makes difficult the correlation of the American output with the main European lines of thought and research. Indeed, an increasing tendency has shown itself in American sociology to abandon the traditional endeavour to unify the whole body of relevant social studies, specialised and general, and to organise their essential product into an integrated doctrine in line with biology and the other "preliminary" sciences. This tendency, narrowing, yet in a sense progressive, has been stimulated by the remarkable advance of psychology in America, and also more or less by Le Bon and his many successors in the study of the group mind. Its main effort has been towards the psychology of groups and their interaction. In other words, American sociology has been especially concentrating on social psychology. *The American Journal of Sociology*, founded by Albion Small in 1895 markedly reflects this specialising tendency in its later issues. Two companion periodicals (*Social Forces* and *The Journal of Applied Sociology*) attest the abundance and vitality of American sociology.

*Germany.*—A notable post-war movement in sociology has arisen in Germany, where, before the World War the subject as such was hardly recognised in the universities, notwithstanding the sustained efforts of Simmel, Ratzenhofer, Barth, Tönnies and others. But an inquiry made in 1925 by Leopold von Wiese showed that in nearly every university of the German-speaking world the study of sociology was being more or less organised. Institutes and societies have been established for promoting sociological studies and research, whence emerges a growing output of periodical and other literature. In addition to the older *Archiv für Sozialwissenschaft und Sozial politik* there are now many periodicals in this field. First after the War came the *Kölner Vierteljahrschrift für Soziologie* (started in 1920 by von Wiese), which gives admirable surveys of current literature in addition to original articles. The *Jahrbuch für Soziologie*; *Ethos*; *Vierteljahrschrift für Soziologie, Geschichte und Kultur-philosophie*; and the *Zeitschrift für Völkerpsychologie und Soziologie*, all began publication in 1925. There has also been a considerable output of books on sociology in Germany since the War, but these, like most teaching in German universities, appear to emanate either from some single and specialised field or from a general philosophy of social life; and so in either case are inadequately related or in comprehensive indifference to the originative and fundamental traditions.

*Other Countries.*—In Italy, Belgium, Spain, Holland, Switzerland and the Scandinavian countries, few signs of progress are discernible in general sociology, apart from sporadic advances of the specialisms within the sociological field. True, the Institut de Sociologie in Brussels has enlarged and improved its journal (*Revue de l'institut de sociologie*) since the War; but in Italy the *Rivista italiana sociologica* has ceased publication. In Czechoslovakia and Poland a definitely sociological movement, with

institutes and prospect of publications, has arisen. Also in Japan there was launched in 1925 a sociological society which publishes a monthly journal.

*The Future of Sociology.*—New growths in general sociology are seriously handicapped by the obstacles that have impeded, or even arrested, the progress of the science during the past two generations. These obstacles, indicated above, need candid recognition and discussion if they are to be overcome, and so make way for that ever-developing inheritance of systematised knowledge which, essential to the continuing growth of every science, is supremely required for the complex issues of sociology. That neglect of the two originative French traditions, which was so marked in Herbert Spencer's *Principles of Sociology* and in his systematic *Tables*, has been too much continued by most later sociologists, and has become well nigh a *damnosa haereditas*.

But a prior obstacle lies at the very foundation of the science. The failure of both Comte and Le Play adequately to organise their respective doctrines and incorporate therein the relevant specialisms of their day, has been aggravated by the unsystematised progress of those detailed advances and by the multiplication of new minor specialisms taken up in disregard of their place in general sociology. And the few synthetic workers, who have laboured to unite and develop the two initiative French traditions into a body of doctrine incorporating the relevant specialisms, have so far, achieved but little success in the leavening of academic institutes and official organisations. Yet, in spite of these many disabilities under which the synthetic movement labours, its progress towards unity and clearness is none the less advancing. (See ANTHROPOLOGY; BIOLOGY; HUMAN GEOGRAPHY.)

(V. B.)

**SODA FOUNTAIN:** see FOOD SERVICE.

**SODDY, FREDERICK** (1877– ), British scientist, was born at Eastbourne, Sussex, on Sept. 2 1877, and was educated at Eastbourne College, the University College of Wales, Aberystwyth and Merton College, Oxford. From 1900–2 he held the post of demonstrator of chemistry at the McGill University, Montreal, where he carried out research work on radioactivity with Sir E. Rutherford, and for the next two years he worked under Ramsay at University College, London, becoming in 1904 lecturer in physical chemistry and radioactivity at the university of Glasgow. Ten years later he went to Aberdeen University as professor of chemistry, but he left there in 1919 to become Lee's professor of inorganic and physical chemistry in the university of Oxford. He made many valuable contributions to the science of radioactivity, and will be particularly remembered for his work on the nature of isotopes, for which he was awarded the Nobel Prize for chemistry in 1921. He was elected F.R.S. in 1910 and was a member of many British and foreign scientific societies, being president of the Röntgen Society 1905–6. (See RAYS.)

His numerous scientific publications, chiefly on radioactivity, include *Radioactivity* (1904), *The Interpretation of Radium* (1909, revised and enlarged by a section on the "Structure of the Atom" (1920), *Chemistry of the Radioactive Elements* (Part I., 1920; Part II., 1914); *Matter and Energy* (1912); *Science and Life* (1920); *Cartesian Economics* (1922), *Inversion of Science* (1924).

**SÖDEN, HERMANN, FREIHERR VON** (1852–1914), German biblical scholar (see 25.339), died in Berlin Jan. 15 1914.

**SÖDERBLOM, NATHAN** (1866– ), Swedish ecclesiastic, was born in Trönö Jan. 15 1866 and educated at the University of Upsala. In 1894 he became chaplain to the Swedish Legation in Paris and in 1901 took a theological degree at the Sorbonne for his thesis *La vie future d'après le Mazdéisme*. He was professor of the history of religion at the University of Upsala from 1901–4 and also at Leipzig from 1912–4 and gained a wide reputation as one of the foremost contemporary investigators in this field and also for his studies of Persian religion and theocracy. In 1914 he became Archbishop of Upsala. In the negotiations after the Lambeth Conference in 1908, which led to an official understanding between the Swedish and English churches, he took an enthusiastic part. Having extensive international relations, Söderblom worked with success for an approach to "evangelical catholicity" among various Christian societies, and played an important part in the preparations for

the universal Christian Conference on Life and Work held at Stockholm in Aug. 1925, in which he was one of the leaders.

#### SOISSONS-REIMS, BATTLE OF: see GERMAN OFFENSIVE.

**SOKOLNIKOV, GREGORY YAKOVLEVICH** (1888– ) Russian communist and financial expert, was the son of a doctor. He studied in Moscow and at the University of Paris. He lived in exile until the revolution of Feb. 1917, when he returned to Russia and entered politics and journalism. After the Nov. Revolution, Sokolnikov at first worked in the Soviet finance department (for nationalisation of banks), but later took part in the civil war, holding the highest military commands in the revolutionary army in Turkistan. At the end of 1921, immediately after the proclamation of the New Economic Policy, Sokolnikov was appointed to the Committee of the People's Commissariat of Finance; at the beginning of 1922 he held the post of deputy people's commissar of finance, becoming commissar soon after.

At this time the finances of Soviet Russia were completely disorganised. Only 10% of the Government expenditure was covered by taxation, if one excepts the taxes in kind on natural products which formed the whole basis of the Government's finances. The daily expenditure could practically only be covered by continual issues of worthless currency. In the course of four years (1922–5) the system of taxes was restored to order, the Government undertakings began to yield a profit, the budget was put in order, the deficit being reduced to negligible quantities; the most important reform being the reform of the currency. This was begun at the end of 1922 and the new State bank was given the right of issuing notes; it was completed in 1924 with the reorganisation of the treasury bills and the stabilisation of the Soviet currency. In 1923–5, which period comprised the chief reforms, the financial department played the most important part in the Government of Soviet Russia, and Sokolnikov enjoyed great political influence. He succeeded in collecting in the finance commissariat a considerable number of energetic young members of the Communist party and talented non-party specialists. At the end of 1925, when great dissensions arose in the Communist party on the economic-political question, Sokolnikov went over to the opposition, joining the group which included Zinoviev, Kamenev, etc. After the 14th congress of the Communist party in Jan. 1926 he was removed from the post of commissar of finance and appointed deputy president of the "Gosplan," or state-planning commission.

(L. N. Y.)

**SOLAR ENERGY.**—The sun radiates out energy at a rate which varies at most only slightly from day to day or from year to year. So far as is known, the rate of radiation is approximately the same for all directions in space. Only a tiny fraction of this radiation, less than one part in two thousand millions, falls on our earth, but from observations on the amount of this it is possible to estimate the total output of solar energy. The solar constant is defined as the quantity of radiation which would fall per minute on an area of one square centimetre at the earth's surface, placed so as to face directly toward the sun, if the earth's atmosphere were absent, the earth being at its mean distance from the sun. The best determination of the solar constant, that of Abbot and Fowle, gives its value as 1.93 calories.

The mean distance of the earth from the sun, 92,800,000 m., is approximately 215 times the sun's radius, so that the energy emitted per minute by a square centimetre of the sun's surface must be  $(215)^2 \times 1.93$  calories, or about 89,000 calories. In terms of energy each square centimetre of the sun's surface has an output of energy equal to that of an engine of 8.4 H.P.

This represents a more concentrated output of radiation than can be produced in the laboratory. The output of energy from the carbons of an electric arc is something under two horse-power per square centimetre, so that the sun's surface must be at a temperature substantially higher than that of the electric arc, which is about 3,700°. The energy emitted from a perfect radiator at absolute temperature  $T$  is  $\sigma T^4$  per sq. centimetre, where  $\sigma$  is Stefan's constant. On the supposition that the sun's surface behaves like a perfect radiator, calculation shows that  $T$

the "effective temperature" of the sun's surface is about 5,740° absolute, or 5,470° Centigrade.

Knowing the area of the sun's surface ( $5.9 \times 10^{22}$  sq. cm.) and the output of radiation per sq. centimetre, we can calculate that the sun's total radiation must be about  $5.4 \times 10^{27}$  calories per minute, the equivalent in energy to the output of an engine of  $5 \times 10^{23}$  horse-power. Even this colossal figure represents a rather low output of energy for a star; the star V Puppis is known to be radiating at fully 10,000 times this rate, while the giant star BD 6° 1309 recently studied by Plaskett is probably emitting some 30,000 times as much energy as the sun.

From quite early times scientific curiosity has, naturally enough, been concerned as to the source of this tremendous outpouring of energy. Early speculations that the sun was merely radiating away an un replenished store of heat, like a red-hot cannonball suspended in space, were soon found to allot it an inadequate span of life. The further conjecture that the sun's heat might be maintained by a sort of combustion of its whole mass did not meet with much better success; it was calculated that if the sun's whole mass were solid coal, and if this coal were burned in pure oxygen, the resulting heat would only suffice to maintain the sun's radiation at its present rate for about 6,000 years.

**Mayer's Hypothesis.**—The first hypothesis to provide anything in the least approaching to an adequate supply of heat was that of Robert Mayer. According to his hypothesis, the energy of the sun's radiation was provided by a continuous fall of meteorites and other small bodies into the sun. A meteorite starting with a small velocity at the confines of the solar system and falling under the sun's gravitational attraction would have acquired a velocity of about 400 km. a second by the time it reached the sun's surface. As the meteorite was brought to rest the energy of its motion would be transformed into heat, precisely as the energy of a bullet is transformed into heat when it strikes the target. Mayer calculated that a shower of meteorites of total mass equal to that of the earth would provide heat equal to that radiated away by the sun in rather over 95 years. Thus the sun's radiation could be accounted for if we were free to suppose that meteors of total mass rather less than that of our moon fell into the sun every year.

The hypothesis required the sun to be continually increasing in mass at a rate equal to about one moon per annum, so that the present mass of the sun fixed a limit to the total amount of radiation that could have been emitted by the sun. It was found that the infall of meteorites could not have provided radiation at the present rate for more than 18,000,000 years. There is in any case no reason for thinking that meteorites are distributed in space as freely as is required by this hypothesis, and indeed every reason for thinking the contrary, for, if meteorites were distributed to the extent required, so many would fall on our earth as to keep its temperature at a point at which it would be uninhabitable (*cf.* GEOLOGY).

**Helmholtz' Hypothesis.**—In 1853 Helmholtz propounded an alternative hypothesis which provided for the same total radiation as the hypothesis of Mayer, without its objections. Helmholtz supposed the sun's radiation to be provided, not by the spasmodic infall of meteorites, but by a gradual and regular infall of the sun's mass as he contracted in consequence of his radiation. The loss of energy resultant on radiation caused the sun to shrink; as this shrinkage took place each particle of the sun's mass moved to positions ever nearer to his centre; the energy set free by this gradual fall provided for more radiation, more shrinkage and so on. On this hypothesis the total heat radiated by the sun since his birth was equal to the total loss of potential energy in the sun's present configuration minus a certain allowance for the heat at present imprisoned in his mass. It was also equal to the heat which would have been radiated if the sun had been formed entirely by an agglomeration of infalling meteorites. Thus the limit set to the sun's total past radiation by this hypothesis was the same as that set by the meteoric theory of Mayer, namely a total past radiation equal to about 18,000,000 years of radiation at the present rate.

*Discovery of Radioactivity.*—Until quite recently no theory of the origin of the sun's heat allotted him a longer life than this. It is true that, in the excitement which first followed the discovery of radioactivity (*q.v.*), it was thought that the properties of radioactive substances permitted of an almost unlimited extension to the sun's past age and future life, but the various conjectures then made speedily proved to be false. A gramme of radium emits heat at the rate of about 138 calories per hour or, measured as energy, at the rate of about 1,600,000 ergs a second, whereas the sun's radiation represents an emission of only about two ergs a second from each gramme of his mass. It would at first sight appear that the supposition that even a small fraction of the sun's mass is radium would amply account for the sun's radiation, past, present and future. This view is fallacious on account of the fact that radium (*q.v.*) does not last for anything like the time throughout which the sun's radiation must be supposed to have lasted; it is reduced to half strength, in about 1,760 years. To allot the maximum possible life to the sun we should have to suppose his whole mass to have consisted originally of pure uranium, the parent radioactive substance out of which all others are formed. Rutherford has, however, calculated that this supposition would add at most 5,000,000 years to the sun's life, radiation being assumed to be at the present rate. Thus all the sources of energy which have so far been mentioned, acting in conjunction, could at most provide for radiation for about 23,000,000 years at the present rate of radiation.

*Geological Estimates of Earth.*—Even before Helmholtz propounded his contraction hypothesis, geologists had estimated the earth's age in hundreds of millions of years, basing their figures on the observed rates of denudation and sedimentation. The discovery of radioactivity provided a better and simpler means of judging this age. A special kind of lead, characterised by having atomic weight 206.0, is produced by the breaking up of atoms of uranium. Now the process of breaking up is a purely spontaneous one proceeding always at the same rate whatever the physical condition of the uranium may be. The constant rate is such that one out of every seven thousand million atoms of uranium breaks up each year. Hence in a mixture of uranium and lead a comparison of the relative amounts of the two substances enables us to estimate the time which has elapsed since the lead first commenced to form. Using this method, geologists are convinced that certain Canadian rocks are at least 1,400 million years old, and as it is generally accepted that the earth originally formed part of the sun it follows that the sun must be older still. (See GEOLOGY.)

*Astronomical Arguments.*—As will be explained later, astronomical arguments indicate that the period of 1,400 million years, which geologists assign as a lower limit to the age of the earth, is at most only a tiny fraction of the age of the sun. While the geologist has been increasing his estimate of the earth's age up to 1,400 million years or more, astronomical research has been moving in the direction of asking for at least 1,000 times this period for the sun and the stars in general.

No doubt a distinction must be drawn between the age of a star and the period during which it has been emitting radiation, but the difference between the two periods is less than might at first be thought. The observed velocities of the stars give some indication as to the intensity of the gravitational field in which they move, and hence of the density of gravitating matter in the universe. It is found that the visible stars account for something like a quarter of this density, and probably for more. Thus it is fairly safe to state that a quarter of the whole matter in the universe, or at least in our part of the universe, is shining, and so to conclude that the period of a star's radiation must be comparable with his total age. Further than this, modern theories of stellar evolution suppose that a star shines most brightly in his early days, then less brightly, and finally ends his days in darkness. Thus if astronomy indicates an age of millions of millions of years for our sun, we are safe in supposing that his total radiation since birth has been greater than the same number. of millions of millions of years of radiation at his present rate. It is in any case abundantly clear, and with a very wide margin

to spare, that our sun, and consequently the other stars also, must have some source of energy beyond those already mentioned.

*Theory of Relativity.*—In 1905 Einstein propounded his theory of relativity (*q.v.*), which requires that any increase in the energy of a body is necessarily accompanied by an increase in its mass, and vice versa. The standard illustration is provided by the changes which are observed to occur in the mass of a rapidly moving electron as its velocity varies. Under more usual conditions the change in a body's mass is so slight as to escape detection; thus the "Mauretania" when at full speed increased her mass by only .00004 grammes.

It is at once evident that if the actual matter in any body could be annihilated, an enormous amount of energy would be set free. In 1904, before the appearance of Einstein's theory of relativity, the annihilation of matter had been suggested as a possible source of energy by J. H. Jeans, who further calculated in 1917 that the annihilation of 1% of the sun's mass would set free sufficient energy to maintain the sun's radiation at its present rate for 150,000 million years. This calculation is wholly independent of any conjectures or assumptions as to the mechanism by which mass is transformed into radiation. Perhaps the most plausible conjecture is that the positive and negative charges of which matter is made fall into one another and mutually annihilate one another in so doing. But, quite apart from this or any other conjectures, the theory of relativity provides the quite general theorem that the annihilation of a mass  $m$  in any way whatsoever sets free an amount of energy  $mc^2$ , where  $C$  is the velocity of light; this is all that is essential to the calculation.

*The Life of a Star.*—Obviously the suggestion underlying this calculation provided a quite simple source of energy for the sun's radiation; the only outstanding question was whether the radiation was in actual fact provided from this source or from some other still un conjectured source. According to generally accepted schemes of stellar evolution a star begins its life as a "giant" star—a sphere of gas of enormous size, low density and very high luminosity. Gradually it changes into a "dwarf" of comparatively small size, high density and low luminosity. Our sun, now a fairly typical dwarf, must have passed through a giant stage in which it radiated far more energy than now, and subsequently experienced a gradual diminution in size and luminosity. It has gradually emerged that the giant stars are of greater mass than the dwarfs, and that, in general, lower luminosity is associated with smaller mass. The close correlation between luminosity and mass was investigated by Hertzsprung, by Adams and Joy, and others, the most noteworthy contribution being made by Eddington, who showed in 1924 that visible stars of a given mass all lay within a comparatively small range of luminosities, the luminosity varying with the mass according to an assigned law. It at once became clear that if our sun had followed the normal evolutionary course, its mass in the past must have been far greater than its present mass. Also, since the rate of radiation corresponding to each mass was known, it became possible to calculate the time interval between any two assigned masses on the supposition that the energy of radiation was derived from loss of mass alone.

In this way Jeans calculated in 1924 that the time since our sun was a giant star must be of the order of seven million million years. It is hardly necessary to specify exactly what precise point in the giant state is taken as the starting point in this calculation; for, on account of their very high rate of radiation of energy in the giant state, stars run through this stage of their careers with extreme rapidity. Now the various astronomical arguments to which reference has already been made agree in indicating a period of just about this magnitude as the most probable age of stars in the condition of our sun.

*Binary Stars.*—Perhaps the most satisfactory estimates are those obtained from a study of binary stars which have broken up by fission. The two constituents of such a system commence life by describing about one another orbits of almost circular shape and of dimensions so small that the two stars are almost in contact. With advancing age both the dimensions and the

eccentricities of their orbits increase, and a purely dynamical calculation indicates that binaries whose constituents are in about the stage of development of our sun must have lived for millions of millions of years. An interesting check is provided by a study of the ratios of the masses of the two constituents of binary stars. The radiation from a massive star is not only absolutely greater than that from a less massive star, but is also relatively greater; the more massive a star, the more radiation it emits per unit mass. As a consequence of this, the masses of the two constituents of a binary must continually approximate to equality as the star grows older, and it is possible to calculate the rate at which this equalisation of mass should take place. Observations collected by R. G. Aitken show that the predicted approach to equality of mass actually occurs, and also make it possible to estimate the ages of binaries of various types.

Calculations based on these data give an age of 4.5 million million years for binaries of spectral types F to G, a figure which is in quite good agreement with the estimate of seven million million years for our somewhat older sun, which is obtained on the hypothesis that the sun's radiation is due entirely to annihilation of its mass.

*Source of Solar Energy.*—These and similar considerations indicate that our sun's loss of mass in the last seven million million years is just about represented by the total radiation which it is believed to have emitted in that time. If so, there would seem to be little room for doubt that a solution has been obtained to the long-standing problem of the origin of solar energy and of stellar energy in general. The answer to the puzzle proves to be the quite simple one that the sun's energy is derived by annihilation of the sun's mass. The electrons and protons which form this mass constitute bottled up stores of energy; the breaking of these bottles of energy and the setting free of the imprisoned energy as radiation is at present proceeding at a rate of rather over 4,000,000 tons a second, and has been proceeding at this or a greater rate for the past seven million million years.

In the same way in which it has proved possible to trace the sun's history back into the past, we can look forward into the future and watch the sun continually decreasing in mass and luminosity. All normal stars appear to follow a single clearly defined evolutionary sequence, and just as any normal star of greater mass than our sun provides us with a picture of what he must have been at some past time, so any normal star of mass less than that of our sun gives a picture of some epoch of his future. To peer further and further into the future of our sun we must look at stars of smaller and smaller mass and so of ever lower luminosity. The faintest known star, Proxima Centauri, which happens to be also the nearest, has a luminosity only one twelve-thousandth of that of our sun, but there is some room for doubt whether this is a normal star, and its mass is at present unknown. Of the stars whose masses are known with fair certainty, the smallest masses must be attributed to the two components of 60 Kruger. Aitken's determination (1925) assigns to them masses of approximately one-fourth and one-fifth of our sun, their luminosities being about a hundredth and a two-hundredth of that of our sun. These stars enable us to visualise what will be the state of our sun after an interval of about a hundred million million years.

*Rates of Radiation.*—While our sun emits energy at the rate of two ergs a second per gramme of his mass, Plaskett's star (B.D. 6°, 1309) already mentioned is radiating about 1,000 ergs a second per gramme. At the other end of the chain the fainter component of 60 Kruger radiates only a twentieth of an erg a second per gramme. As a general rule the farther advanced a star is the less its radiation per gramme. This suggests that a newly born star consists largely of types of matter which transform themselves fairly rapidly into radiation; as the star ages, these easily transformable types soon get used up, so that the older stars consist solely of less transformable types. It is likely that there must finally remain a residuum of mass consisting of types of matter which either do not transform into radiation at all or at best transform themselves with extreme slowness. If the earth is at present transforming any of its mass into radiation,

this must be at most at the rate of a ten-thousandth of an erg a second per gramme of its mass, since any higher rate would be inconsistent with the actual temperature of the earth's surface. Thus the various chemical elements known on earth are probably of the non-transformable type. If so, the sun and the younger stars must be supposed to consist, in part at least, of chemical elements unknown to us on earth, which have the capacity of transforming their mass fairly rapidly into radiation. These unknown elements are probably of higher atomic weight than our terrestrial elements, although possibly our radioactive elements (uranium, radium, etc.) represent a last vestige, appearing even now only in infinitesimal quantities and destined ere long to disappear altogether. (See also RADIATION.) (J. H. JE)

**SOLOGUB, FEDOR**, pen name of Fedor Kuzmich Teternikov (1863– ), Russian man of letters, was born Feb. 17 1863 in St. Petersburg (Leningrad), the son of a tailor. On the latter's death, his mother became a domestic servant and the son was brought up by her employers. He studied at the Teacher's Institute in St. Petersburg and was a schoolmaster for 25 years, retiring in 1907. In 1897 he published his first volume of poetry and also some short stories. He is considered the greatest figure of the Symbolists in prose and poetry. His best novel is *The Little Demon* (1907), in which he has created a universal type of evil in the central figure, the schoolmaster, Peredonov. He also wrote several plays.

His other works include *The Sorcery of Death* (a series composed of *The Created Legend*, *Drops of Blood*, *Queen Ortruda*, and *Smoke and Ashes*). *The Little Demon*, *The Created Legend*, *The Old House* and other *Tales* have been translated into English.

**SOMALILAND** (see 25.378).—The country continues to be divided between Abyssinia, Great Britain, Italy and France. The frontier between the Italian and Abyssinian regions was delimited in 1911, when, in the north, it was fixed at 48° E. instead of 47° E. as provided in the 1908 agreement. This placed all the Ogaden tribal lands under Abyssinian authority.

#### I. BRITISH SOMALILAND

This district has an area of 68,000 sq. m., and a population (1921) of 346,998, including 2,205 foreigners (European Arabs and Indians.) Berbera, the capital and chief port, has, in the trading season, some 30,000 inhabitants. The policy of "strict coast concentration" adopted in 1920 in consequence of the costly and ineffective campaigns against Mohammed bin Abdullah, the "Mad Mullah," broke down. Efforts to restore order were inevitable; they began inauspiciously. In Aug. 1913 a camel constabulary party under R. C. Corfield was cut up, Corfield being killed. In March 1914 dervish raiders reached the coast and fired into Berbera. In May 1914 Mr. (later Sir) Geoffrey Archer became Commissioner (a title changed in 1919 to that of Governor), and on his representations further operations were authorised. Major T. A. Cubitt inflicted severe punishment on the dervishes in Nov. 1914–Feb. 1915, but the Mullah, who had retired to the border of the Mijertin country, subsequently again overran a large part of the protectorate. An end was, however, put to his activities in 1920, when by operations planned by Archer and carried out by Lt.-Col. (later Sir) Gerald Summers almost the whole dervish force was destroyed. The success of these operations was primarily and mainly due to the Royal Air Force. The dervishes, good fighting men, were demoralised by the attacks from the air. The Mullah himself escaped, fleeing into Abyssinian Somaliland, where, at the town of Imi, he died in Jan. 1921.

The overthrow of the Mullah marked the deliverance of the country from 21 years of dervish oppression. In 1922 Sir Geoffrey Archer, who had brought about this deliverance, was transferred to Uganda. He was succeeded by Sir Gerald Summers, who worked hard and with satisfactory results to improve the moral and material conditions of the Somalis. Sir Gerald died in Nov. 1925, and in Jan. 1926 Mr. H. B. Kittermaster, secretary to the administration since 1921, was appointed Governor.

A considerable number of sheep and goats and a smaller number of cattle are exported, but by far the most valuable export is

that of skins, the Somali sheep and goat skins being of very high quality. Ghee, gum and salt (the last named to Abyssinia) are other exports. Sheeting and longcloth, dates, rice and sugar are the chief imports. The growth of Japanese imports of grey sheeting, as opposed to American cloth, which had had a practical monopoly, was very noticeable in 1923 and 1924. In 1910-1 the value of imports was £267,000, of exports £247,000. In 1924 the value of seaborne trade was: imports £333,000, exports £228,000. The transit trade with Abyssinia, via Zeyla, was valued at £33,400. Revenue, mainly from customs, was but £30,000 in 1910-1, when expenditure was £99,000. For 1924-5 revenue was £82,000 and expenditure £150,000. Deficits are met by grants from the British Exchequer.

Drake Broekman, *British Somaliland* (1917); Major H. Rayne, *Sun, Sand and Somalis* (1921); D. Jardine, *The Mad Mullah of Somaliland* (1923). See also the *Report on Somaliland*, issued annually by the Colonial Office, London. The account of the final overthrow of the Mullah is given in a supplement to the *London Gazette* of Nov. 1 1920.

## II. FRENCH SOMALILAND

The value of this small, largely arid and sparsely populated colony lies in its port, Jibuti, the only French port on the Suez Canal route and the main artery of trade with Abyssinia. The railway to Addis Ababa, owned by a French company, was, after many delays, completed in 1917. Four-fifths of the trade of Jibuti is in the conveyance of goods to or from Abyssinia. It serves also as a coaling station, the coal being previously imported. The chief local industries are shark and mother-of-pearl fisheries and the collection of salt from the Bahr' Asal; since 1912 the salt exports have risen from 4,000 to some 14,000 tons a year. In 1914, when the railway was open only as far as Dire Daisa (30 m. short of Harrav), the value of exports was 43,600,000 fr. and of imports 28,700,000 francs. In 1922 exports were valued at 170,800,000 fr. and imports at 160,400,000 francs. Jibuti had (1921) 8,366 inhabitants, of whom 354 were Europeans. The population of the colony is said to be about 200,000—apparently an overestimate—and consists of Denakil, Somali and Galla, who, on the grassland of the higher ground, rear camels, goats and black-faced sheep.

In 1919 the local budget balanced at 2,370,000 fr., in 1924 at 5,015,000 francs. The colony is administered by a governor, assisted by a nominated council composed of official and unofficial members. Apart from occasional raids by the nomads, who, away from the railway zone, are left much to their own devices, the colony has been peaceful. Lej Yasu, the deposed Emperor of Abyssinia, was in the Donakil country in 1917-8, but his efforts to raise the tribes against the French failed.

**BIBLIOGRAPHY.**—*French Somaliland*, a British Foreign Office handbook (No. 109), 1920; Capt. M. Borlée, "La Côte française des Somalis," *Bulletin Soc. Royale Belge Géographie* (1924) and the "Côte française des Somalis" (*Annual Reports* by the French Colonial Ministry).

## III. ITALIAN SOMALILAND

Revised estimates give the area at some 154,000 square miles. The population is probably overestimated at 650,000. There were in 1921 664 Europeans (almost all Italians). These figures are exclusive of Trans-Juba, transferred to Italy by Great Britain in 1925 (see JUBALAND). The country is divided into Southern and Northern Italian Somaliland. In the southern division, a Crown Colony, under a civil governor since July 1910, energy was shown in the development of the somewhat scanty natural resources of the land and in the valleys of the Webi Shebeli, and the Juba cotton and rice were cultivated. The chief exports continue, however, to be durra, sesame, ghee, gum, myrrh and hides. From Mogadishu, the capital (population, in 1923, 20,700) a railway was built to Afgoi, 18 m., as the first section of a line to the Abyssinian frontier at Lugh. By 1924 some 2,000 m. of roads had also been built. The effect of the transfer of Jubaland remained to be seen in 1926; by giving the Italians possession of Kismayu it placed at their disposal a port superior to any on the

Benadir coast. The colony had required constant subventions from Italy; thus, in 1924, colonial revenue was but 2,857,000 lire, while expenditure totalled 24,000,000 lire. Exports were far below imports in value; the figures for 1922 were: imports 51,000,000 lire, exports 11,000,000 lire. In part, the exports consist of goods from Abyssinia.

Northern Italian Somaliland was divided into the Sultanate of the Mijertin, whose territory included the coast facing the Gulf of Aden, the Nogal Territory (in the centre) and the Sultanate of Obbia. The economic value of these regions is not great, but they are famed for the abundance of plants which furnish frankincense and myrrh and also gum arabic. The Nogal Territory was for some years occupied by the "Mad Mullah," but he failed to agree with Mohammed Osman, the Mijertin sultan, and there were intermittent hostilities between them from 1908 to 1919. The overthrow of the Mullah by the British left the Somalis free to quarrel among themselves. In pursuance of the forward colonial policy adopted by the Fascist Govt., the Italians in 1925 decided to bring the sultanates under direct control. Military operations followed, and in Oct. 1925 it was announced that Sultan Ali Jusuf of Obbia had come to terms. The submission of the Mijertins was reported in April 1926. A campaign followed in the Nogal Territory, where the Somalis opposed the Italians with some stubbornness.

**BIBLIOGRAPHY.**—*Relazione sulla Somalia Italiana*, issued by the Italian Colonial Office (1912); G. de Martino (sometime governor of the colony), *La Somalia Nostra* (1913); G. Stefanini and G. Paoli, *Ricerche idrogeologiche, botaniche ed entomologiche fatte nella Somalia Italiana Meridionale* (Florence, 1916); *Italian Somaliland*, a British Foreign Office handbook (No. 128), with Bibliography (1920); Luigi Amadeo (Duke of Savoy), "La Somalia," in *La Vie d'Italia* (1920); R. **SOMBART, WERNER** (1863— ), German economist, was born at Ermsleben in the Harz Jan. 19 1863; he studied in Pisa and Berlin, and in 1888 became secretary of the chamber of commerce in Bremen. He taught at the University of Breslau from 1890, at the Berlin commercial high school from 1906, and in 1917 was appointed professor at the University of Berlin. Sombart wrote prolifically on economic, historical and social problems. His best known work is *Der Moderne Kapitalismus* (1902, revised and enlarged ed. 1916). His books are stimulating and fertile in ideas, but many of his views conflict with those of others, and have given rise to a great deal of controversy.

Sombart's published works include *Sozialismus und soziale Bewegung im 19. Jahrhundert*; the 10th revised edition of this treatise, published in 1924, bears the title: *Der proletarische Sozialismus. Wirtschaft und Mode* (1902), *Die deutsche Volkswirtschaft im 19. Jahrhundert* (1903, 5th ed. 1921), *Das Proletariat* (1906), *Das Lebenswerk von Karl Marx* (1909), *Die Juden und das Wirtschaftsleben* (1911), *Luxus und Kapitalismus* (1912), *Die Ordnung des Wirtschaftslebens* (1925). Sombart is the editor of *Grundlagen und Kritik des Sozialismus* (1919).

**SOMME, BATTLE OF THE.**—This engagement, an offensive on the part of the British armies, with some assistance from the French, opened on July 1 1916. Between Ham and Arras the river Somme runs first from south to north as far as Péronne and then bends sharply to the west, in which general course it continues to the sea. From Péronne a low range of hills runs somewhat to the north of west, forming the watershed between the Somme and the basins of the Scarpe and the Schelde.

This ridge had fallen into German hands in Oct. 1914 in the course of the operations usually described as "the race to the sea" and the line in this quarter, indeed on the whole front from Arras southward to the Oise, had remained substantially unaltered during 1915, the chief change being that in July 1915 a British III. Army had been formed which relieved the French between the Ancre and the Somme. Subsequently a IV. Army was also formed, and early in 1916 the British had relieved the French X. Army on the Arras front, making their line continuous from Ypres southward. The right boundary between the British and French had varied considerably and in June 1916 was near

Maricourt, about 3,000 yd. north of the Somme. Here the Allied line, which southward of this point ran north and south, turned sharply and following the lower slopes of the watershed already described ran west for another 7,000 yd. to make another sharp turn at Fricourt, whence it ran north for 10,000 yd. to the Ancre, which pierces the ridge between Thiepval and Beaumont Hamel, continuing definitely in a northerly direction north of that river.

**Reasons for the British Offensive.**—When the German attack on Verdun opened in Feb. 1916, neither the artillery and ammunition situation of the British nor the training of many of the more recently arrived "New Army" divisions was such as to permit of their giving relief to their allies by taking the offensive on a big scale. Their help had consisted in the taking over of a long stretch of the French line, but as the spring turned into summer it had become evident that more than this would be necessary, for the French defence, though determined and resourceful to a high degree, was being very severely tried and the position was frequently critical. Sir Douglas Haig therefore agreed to set on foot plans for an offensive on a very large scale, although from the purely British standpoint it was doubtful whether such an effort was not still somewhat premature, neither the ammunition output nor the supply of guns being as yet equal to starting a serious offensive at more than one point, so that once the point of attack had been declared the advantages of surprise and the initiative would be largely discounted.

**German Positions.**—The German positions on the frontage to be attacked, a distance of some 25 m. in all, were extremely for-

midable. Their defenders had been in undisturbed possession for over a year and a half, they had had ample time therefore to turn to advantage the natural features of the ground and to supplement them by artificial means. Woods and villages had become fortresses, two elaborate trench systems had been constructed about two to three miles apart, each containing several lines and connected up by intermediate lines or "switches" which greatly complicated the task of the attacker who should penetrate any part of the front. Deep "dug-outs," easy to construct in a chalk country, protected the trench garrisons against the heaviest bombardments, broad belts of barbed wire obstructed the approaches, the lines bristled with well-placed and protected machine-guns, and every point of tactical importance had been specially fortified. The advantage of the ground as regards facilities for observation lay with the Germans, although south of the Somme where the French were to attack on a frontage of nine miles, conditions were less in their favour and their defences less formidable.

For an attack on such positions the most elaborate preparations were necessary, both tactical and administrative. Roads and railways had to be made, vast dumps of ammunition and stores collected and protected, gun positions selected and dug, bivouacking and encamping grounds prepared, the water supply expanded. It was not till the end of June that the offensive could be started; and it had been practically impossible to conceal from the Germans the scale and nature of the preparations or the intended extent of the attack, although such precautions as were possible had been taken.

## I. THE FIRST ATTACK

After a week's preliminary bombardment of unparalleled intensity the Allied attack was delivered on the morning of July 1. On the British left north of the Ancre the VIII. Corps attacked from Serre to Beaumont Hamel, but though its centre penetrated some way into the German lines north of Beaumont Hamel the flanks were checked and the central division was finally dislodged. Equal ill-success attended the X. Corps south of the Ancre and the left of the III. Corps on its right, in their attacks on the formidable defences of Thiepval and Ovillers. However, on the right centre just north of La Boisselle and between La Boisselle and Fricourt lodgements were not only made but maintained by the right of the III. Corps and the left of the XVII. East of Fricourt, again, the three British divisions attacking in a northerly direction were all successful, Mametz and Montauban were taken and all the objectives secured, while beyond them the French astride the Somme fared brilliantly, reaching Hardecourt and Curlu north of the river, while south of it they actually penetrated to and captured six miles of the German second line.

The Germans had apparently not expected a French attack and were less well prepared on the Fricourt-Montauban front than on the line running north from Fricourt, where both their positions and their fortifications were strongest, and the substantial success achieved by the British right and by the French went some way towards compensating for failure elsewhere. Sir Douglas Haig, realising the formidable nature of the frontage astride the Ancre, concentrated his attention on exploiting the success of the right and in the course of 10 days of hard fighting in which some six fresh divisions were thrown into the struggle important gains were made: Fricourt, La Boisselle and Contalmaison were reduced, several woods were cleared and the line was advanced on a front of over six miles to within reach of the enemy's second system of defences on the southern crest of the main ridge.

*Second Line of Defence Assaulted.*—This system, less strong than that stormed on July 1, was formidable enough and the stubborn resistance of the Germans in their front system and intermediate lines had allowed large reserves of men and guns to be brought up and the defence to be reorganised. However, the attack on the second system, delivered at dawn on July 14, established the British on the Bazentin Ridge on a 6,000 yd. frontage, cleared the Bazentins and Longueval, penetrated into Delville Wood on the right and to High Wood in the centre and compelled the surrender of Ovillers, already isolated. But though at one time it looked as if prompt exploitation of the success might yield far-reaching results, reserves could not be thrown in quickly enough to make good and retain High Wood and before long the Germans started counter-attacking in great force and with much determination. Several weeks of hard fighting elapsed during which the British were unable to make more than very gradual progress at disproportionate cost.

These weeks, the second half of July, all Aug. and the beginning of Sept., saw desperate contests for Delville Wood at the salient angle on the British right, for High Wood in the centre, for Pozières and Mouquet Farm further to the left in the Thiepval direction. The lodgement gained on the main ridge needed to be extended, especially on the flanks, but the Germans had brought up large reserves, were employing a great weight of artillery and still enjoyed great advantages in position.

The British progress was slow, especially on the right, where Ginchy, Guillemont and Falfemont Farm formed a barrier against which many attacks were shattered even after Delville Wood had been won. It was important to extend on this side to get touch with the French who were gaining ground north of the Somme: Pozières equally was a stumbling-block to the advance of the British centre and behind Pozières were all the formidable defences of which Thiepval was the centre. Division after division was thrown into the fight, fought desperately, lost heavily and apparently achieved little, though Pozières was taken by the Australians before the end of July and other gains were made beyond its ruins. But the strain was telling heavily on the Germans: they checked the Allied progress but their resources in

men, guns and ammunition were, by Ludendorff's own admission, taxed to the utmost to do so, while they had to relinquish entirely their attacks on Verdun, the cessation of which was ordered almost immediately after the supersession as chief of the staff (Aug. 27) of Falkenhayn by Hindenburg.

## II. THE SECOND AND THIRD STAGES

With Sept. the Allies began to reap the fruits of their struggles. On Sept. 3 a renewed attack astride the Ancre by the V. Army, recently formed out of Rawlinson's IV. Army and placed under Sir H. Gough, was unsuccessful, and the centre made little progress. However, the right at last mastered Guillemont and in the next few days added Falfemont Farm, Ginchy (Sept. 9), Leuze Wood and Bouleaux Wood to its gains, while the French made substantial progress north of the Somme and gained a big success south of it, taking 7,000 prisoners and storming three m. of the old German front line as far as Chaulnes. These successes removed the main obstacles to the advance of the British centre, freeing it from the menace—the Falfemont Farm—of being enfiladed from Ginchy line. The British were now well established on the forward crest of the main ridge and could prepare to attack the villages on the northern slopes of the watershed.

The third phase in the offensive was ushered in on Sept. 15, by an attack on a broad front in which 10 divisions took part. The special feature of this attack was the employment for the first time of "tanks," (*q.v.*) the reply to the problem of the machine-gun behind barbed wire. The new weapon achieved a modified success, not all that had been hoped by its designers but enough to encourage the Allies and to shake the morale of the Germans, besides yielding valuable lessons for its future development and use. On the left and centre the attack did well, Courcellette, Martinpuich, High Wood and Flers were all taken with many prisoners. On the right, however, Lesbœufs and Morval were not reached and only after sharp fighting was the line straightened by the capture of the Quadrilateral (Sept. 18.), which had held up this wing. This obstacle at last disposed of, a fresh attack on Sept. 25, swept over Morval, Lesbœufs and Gueudecourt and by joining up with the French who had again secured substantial successes both north and south of the Somme, compelled the Germans to evacuate Combes (Sept. 26).

*Success of the V. Army.*—Simultaneously with this success operations on a big scale were resumed by the V. Army on the British left and Thiepval was at last taken (Sept. 26) with the Zollern, Stuff and Schwaben redoubts behind it. This important success left the Germans with only the scantiest foothold on the main ridge and was followed by further gains by the left of the IV. Army astride the Albert-Bapaume road. Thus by the beginning of Oct. the enemy has been driven back to his last completed line of defences, which ran from Sailly-Saillisel on the right, past Le Transloy and in front of Bapaume: he was busily engaged on fresh lines further in rear but as yet these were far from ready or formidable.

It really seemed therefore as if Oct. might see the Allies reaping full harvest of their earlier efforts. The rearward German defences could not be compared with those already penetrated and there had been some indications that the German morale was beginning to decline: there had been less stubbornness in the resistance encountered, less vigour in the counter-strokes. Unluckily an exceptionally wet Oct. robbed the Allies of the spoils which seemed in their grasp. Continuous and heavy rain combined with the effects of the bombardments to make the ground a sea of mud, across which guns and transport could hardly be moved, and even lightly equipped men could only struggle slowly forward. Attacks under such conditions were terribly handicapped; that most of them failed was not remarkable, for when a trench was taken the difficulties of consolidating it were greater than ever. What was more remarkable and a great tribute to the valour and determination of the troops engaged was that some progress was made, despite all obstacles. On the right the British established themselves on a spur running north-west between Gueudecourt and Le Transloy, in the centre Eaucourt l'Abbaye (Oct. 3) and Le Sars (Oct. 7) were taken, though

repeated attacks on the Butte de Warlencourt were foiled by the mud. On the left Regina Trench was taken, the western portion on Oct. 21, the eastern three weeks later, but the weather was becoming very bad and further operations were more difficult to carry out.

### III. THE LAST OFFENSIVE

By about the middle of Nov. the British had secured almost the whole of the main ridge and had advanced quite far enough to make the German defences north of the Ancre into a pronounced salient with its apex at Beaumont Hamel. Had Oct. 1916 been as fine as Oct. 1914 or Oct. 1918, it is probable that the Allies might not only have pierced the Le Transloy line but by advancing on a wide front to the north and northeast they might have outflanked the Beaumont Hamel position and the whole German frontage as far as Arras. The rains had prevented this, but with the Allies in possession of Thiepval it was possible when at last the weather improved a little to renew the attack on Beaumont Hamel with better chances of success. The last important operation in the Somme offensive took the shape, therefore, of an attack by seven divisions on Nov. 13, which proved most successful on the right and centre, clearing the Germans off their last foothold between Thiepval and the Ancre and taking St. Pierre Division, Beaumont Hamel itself and Beaucourt-sur-Ancre with 7,000 prisoners.

On the left, however, Serre again proved impregnable; but by Ludendorff's own admission the loss of Beaumont Hamel was a severe blow. However, before the success could be much further expanded the return of bad weather again put a stop to active operations, which were not resumed on any considerable scale until well after the New Year. In the two months which preceded the German retreat to the Hindenburg line (March 1917) much was achieved which the bad weather of the autumn had then rendered impracticable and these operations, which had brought the British within striking distance of the last line covering Bapaume and Péronne before the Germans anticipated an enforced evacuation by retreating, may really be regarded as the belated culmination of "the Somme." Unluckily in March 1917, the Germans had a Hindenburg line to fall back to—there would have been none in existence had Oct. 1916 been dry.

*Results of the Somme Battles.*—The Allied offensive on the Somme may not have yielded all the immediate results that had been hoped for. Progress had been slower, casualties infinitely heavier, gains of ground far smaller than were anticipated. Nevertheless the three main objects had been achieved: the pressure on Verdun had been relieved, the enemy's main forces had been pinned down to the Western Front, his powers of resistance had been substantially reduced. Ludendorff himself has testified to the effect of the long struggle on the German morale and it is only necessary to compare the general strategical situation on Dec. 31 1916 with that of July 1, to see what a change had come over the War. It had been effected in the stubborn and apparently disproportionately costly struggle for the watershed between the Ancre and the Somme, and not outside France where the Russian offensive had been checked, Rumania had collapsed, the Italians had been held up and the capture of Monastir had been a mere flash in the pan, powerless even to help Rumania. Kut was still untaken, the British had not yet reached Palestine. It was the Somme which had wrought the change, even if bad weather had prevented the immediate exploitation of the success earned between July 1 and Oct. 1, and even though early in 1917 changes of command and of plan were to throw away much that the campaign on the Somme had placed within reach of the Allies. For the fighting sometimes known as the second battle of the Somme, see GERMAN OFFENSIVE AND VICTORY, ADVANCE TO.

**SOMOV, KONSTANTIN ANDREEVICH** (1869– ), Russian painter, was born in St. Petersburg (Leningrad), Nov. 30 1869,

his father being director of the Hermitage Museum. Early in his career he worked under Ilya Repine, the realist painter and professor of the Academy of Arts. The spirit of the 18th century attracted him strongly and he was greatly influenced by the masters of the "Fêtes Galantes" and by the modern art of Aubrey Beardsley and Charles Conder. The retrospective qualities of his style are well illustrated in "Rainbows" and "fireworks," which were his favourite subjects; while his portrayals of Italian comedy in rococo environment show a sympathetic understanding of the subject. Somov was one of the founders of the group known as "The Artistic World." In 1919 he issued *The Book of the Marquise*, which he illustrated with a number of characteristic drawings. His best portraits, which are drawn in coloured crayon, show remarkable delicacy of execution and masterly delineation of character and bear comparison with the work of Clouet and Ingres. Somov, who was a connoisseur of ceramics, also produced a number of groups painted on china. See Oscar Bie, *Constantin Somoff* (1907).

**SONIC DEPTH FINDER:** see SOUND RANGING.

**SONNINO, SIDNEY, BARON** (1847–1922), Italian statesman (see 25.416). During the debates on Giolitti's Steamship Subsidies Bill in the spring of 1909, it was Baron Sonnino who conducted the most vigorous attacks against the Government, exposing the radical defects of the measure, and when Giolitti resigned on Dec. 2 it was Sonnino who was called upon to form a ministry, for the second time. But he did not enjoy the favour of the still Giolittian Chamber, and his Cabinet was defeated over the new shipping bill. On March 21 1910 he resigned, again after 100 days of office. He continued to take an active part in the debates in the Chamber, and was a stern but just critic of Giolittian political methods, although during the Libyan war he generally abstained from opposition for patriotic motives.

In the autumn of 1914, after the death of the Marquis di San Giuliano, the Premier, Salandra, assumed the Foreign Office for a short time, but when he reconstituted his Cabinet on Nov. 5 he offered that portfolio to Sonnino, who accepted it. His conduct of the Foreign Office was characterised by sincerity of purpose, high principles, unswerving patriotism and a wide knowledge of international politics. He had not, however, a free hand. He was still Foreign Minister, under Orlando's premiership, during the Peace Conference, which he attended as second Italian delegate from Jan. 18 to June 19 1919. On the fall of the Orlando Cabinet (June 19 1919) Sonnino retired into private life. He died Nov. 24 1922.

The irritation of the whole of Italy against the policy of the Allies towards Italy at the Peace Conference reacted to some extent against the nation's representatives at Paris, and Sonnino himself came in for a large share of unpopularity also, on account of a certain caustic hardness of manner and his strong objection to compromise in any form, although the more intelligent and better informed part of public opinion realised the great difficulty of his task and the inadequate support afforded him by Orlando, as well as the value of his actual achievements. He did not stand for Parliament at the elections in Nov. 1919, but was subsequently made a senator in 1920. In spite of what was regarded as his failure to overcome the obstacles of the Peace Conference, he enjoyed the reputation of being the greatest Minister for Foreign Affairs that Italy had had since Cavour, with the possible exception of Crispi, while as a financier he ranked very high. As early as June 1922 he realised that if Italy was to be saved from catastrophe some form of *coup d'état* was necessary. When the Fascists seized power in Oct. following, he viewed the movement with sympathy, although he was no longer in active politics. He was also a man of wide reading and culture, and a distinguished Dante scholar and bibliophile.

**SOPWITH, THOMAS OCTAVE MURDOCH** (1888– ), British airman and inventor, was educated at Cottesmore and at Seafeld Engineering College. Having won the Baron de Forest Prize of £4,000 for a flight from England to the Continent in 1910, in 1912 he founded the Sopwith Aviation Co., Ltd., at Kingston-on-Thames. During the World War this firm designed

and produced large numbers of aeroplanes and seaplanes for the British Government. Sopwith also became joint managing director of the H. G. Hawker Engineering Co., Ltd., Kingston-on-Thames. In 1918 he was made a C.B.E. He married in 1914 Beatrix, daughter of the 8th Baron Rethven.

**SORABJI, CORNELIA** (1866– ), Indian author and publicist, born at Nasik, was the fifth daughter of the Rev. Sorabji Kharsedji, an agent of the Church Missionary Society at Poona converted from Zoroastrianism, and of Francina Sorabji, a Hindu convert and educational pioneer. The first girl student of the Deccan College, Poona, Cornelia graduated in 1887, went to Somerville Hall, Oxford, in 1888 as a scholar, and in 1893, received the B.C.L. of Oxford. In 1904 she was appointed a legal adviser to the court of wards, Bengal, and later held the same position in Bihar and Orissa, and Assam. In these and other provinces she rendered very effective service to female landowners who suffered from the handicap of the *purdah* system. Miss Sorabji was awarded the Kaisar-i-Hind gold medal in 1909 and received the bar of the first class in 1922. She was enrolled in 1921 as a vakil of the Allahabad High Court. In 1923, soon after the removal of the sex disqualification she was called to the Bar by Lincoln's Inn, and returned to India to practise in the High Court, Calcutta. Both in her writings and her speeches, she showed a remarkable gift for graphic and sympathetic depiction of widely varied types of Indian life, with full appreciation of the value of the British connection.

Her best known books were *Love and Life Behind the Purdah* (1901) and *Sun-Babies* (1904), of which there was a second series in 1920. She also published *Between the Twilights* (1908), *Indian Tales of the Great Ones* (1916), the *Purdahnashin* (1917) and *Therefore* (1924).

**SOROLLA Y BASTIDA, JOAQUIN** (1863–1923), Spanish painter (see 25.434), was engaged for practically the whole of the decade 1910–20 on work for the Hispanic Society of America. It includes a series of portraits of Spanish writers and a "Panorama of the Forty-nine Provinces of Spain," consisting of 49 immense compositions, each representing views, costumes and customs of a different province. This great undertaking was completed before paralysis brought the artist's painting to an end. Important exhibitions of his work were held at the Grafton Galleries, London, 1908; in New York, 1909; in Chicago, 1913; and he was represented by two typical works in the 1920–1 exhibition of Spanish paintings at Burlington House. He died at Madrid Aug. 10 1923.

See Hispanic Society of America, *Eight Essays on Joaquín Sorolla y Bastida*, 1909; A. de Beruete y Moret, *Sorolla y Bastida*, 1920.

**SOUND**: (see 25.437).—The increase in our knowledge of the subject of acoustics (the science of sound) during recent years has been largely associated with the War conditions which prevailed from 1914 to 1918. As a consequence of the War the development of this science has been abnormal, and research has been directed towards the rapid realisation of practical acoustic devices and methods for immediate use in warfare, both on land and sea. Some aspects of the investigations have received continued though less urgent attention since the War, with important results. A general survey of the work done shows that the advances consist of applications of well-established principles rather than the discovery of new phenomena. Generally, the observations made have proved to be in accordance with previous theoretical investigations, mainly due to the first Lord Rayleigh.<sup>1</sup> The work falls naturally under two headings, viz.: (1) the detection and perception of direction of sounds in air, and (2) the detection and perception of direction of sounds in water. Theoretically these two problems have much in common, but practically there are important differences which make it desirable to treat them in separate sections. A special section (3) is devoted to the important advances in auditorium acoustics, and the remaining section (4) deals briefly with miscellaneous outstanding features of modern work on sound.

<sup>1</sup>Lord Rayleigh's work is contained in his *Collected Papers* (No. 6, 1920). His contributions were numerous between 1911 and 1919, when he died.

## I. DETECTION AND PERCEPTION OF DIRECTION OF SOUNDS IN AIR<sup>2</sup>

*Detection*.—The human ear itself is a remarkably sensitive detector of the air vibrations which constitute sound. It is still much superior in this respect to any mechanical device which has yet been produced for recording the vibrations visually. Thus the perception of feeble sounds of necessity depends upon the limitations of audibility, either indirect listening, or with the ear aided by the intervention of an electrical device such as a microphone. The audibility of a feeble sound can be very largely augmented by making use of the principle of resonance, provided that the sound itself approximates to a pure tone. This can be secured, for example, by the use of a Helmholtz resonator applied to the ear in the case of direct listening, and in addition by tuning the diaphragm receiver when microphonic listening is adopted. It has happened fortuitously that some of the chief sounds in air which it is important to be able to detect, viz.: those emitted by aircraft, does contain predominant notes, apparently due to engine exhaust, which enable the application of resonance, as above indicated, to increase largely the range of audibility.

The operation of the *Döppler effect*, arising from the relative motion between the aircraft and the observer, prevents the possibility of the identification of the machine by means of the observed frequency, this being liable to change by as much as 20%, according to the speed and direction of flight. An interesting observation which has been constantly made is that the notes of low pitch continue to be heard at ranges where those of high pitch have ceased to be audible. This is in accordance with the theoretical expectation that damping increases with frequency.

The determination of the direction whence a sound arrives is theoretically possible by a variety of methods dealt with below, several of which have been tried in aircraft localisation.

(a) *Binaural Listening*.<sup>3</sup>—Lord Rayleigh's experiments (*Collected Papers*, vol. 5, p. 347) have shown that low-pitched sounds are determined in direction by the observation of the phase difference between the vibrations arriving at the two ears. This principle has been applied in direction-finding, and the effect has been exaggerated by increasing the distance between the two points of reception. The sound is received by two equal trumpets or horns rigidly connected together and capable of rotation about axes perpendicular to the line joining them. Separate and exactly equal tubes lead from the trumpets to the two ears respectively, and the apparatus is rotated until the sound under observation appears to come from directly in front. The line joining the sound receivers is then perpendicular to the incident sound stream. An alternative method which dispenses with the necessity of rotating the apparatus is to use a *compensator* or *phase-measurer*, which consists of tubes, adjustable in length, inserted between the sound receivers and the appropriate ears, so as to provide a path difference equal to that between the distant source of sound and the two receivers. Adjustment of the tube lengths is made until the impression received is that the sound is neither to the right nor to the left, and the determination of direction is then a matter of simple geometry. In practice the compensator is graduated to give direct angular readings.

The practice of binaural listening has verified theoretical conclusions in several important respects. It has been found that it is easier to perceive the direction of a mixed sound, or noise, than a pure note. Apparently it is necessary that the wave train should contain more or less isolated special characteristics whereby the

<sup>2</sup> The information contained in this section is largely drawn from a manual entitled *Development of Sounds*, kindly placed at the writer's disposal by the British Munitions Inventions Department.

<sup>3</sup> This method of perception of direction has been largely used also in a connection which scarcely justifies treatment in a separate section. The *geophone* is an instrument for direction-finding of sounds proceeding through the earth, and its particular use during the War was for localising the sounds of picks, etc., used in tunnelling and land mining. It consists of two hollow boxes connected by equal tubes to a stethoscope arranged so that the sounds proceed from the two boxes to separate ears. The boxes are laid upon the ground a few feet apart, and moved about until the sounds of the pick appear to come from straight ahead. It is then known that the sound source is on a line perpendicular to that joining the two geophone receivers, since the sounds arrive through the earth in synchronism. By combining several pairs of geophones separated by considerable distances, the actual position of the pick can be estimated, for it lies at the intersection of the several perpendiculars above specified.

phase difference can be readily appreciated. In the regular sine wave corresponding to a pure tone each vibration is exactly like those which immediately precede and follow it, and the ears are unable to identify corresponding displacements. It is apparently also necessary for successful binaural listening that the two portions of the incident wave which enter the two receivers should be free from subsequent distortion; in particular, that the sound receivers should be as nearly as possible non-resonant for the vibrations in question. Any amplification of the sound which depends upon resonance, therefore, such as the use of Helmholtz resonators already referred to, is incompatible with efficient direction-finding by observations of phase difference.

The method is subject to many errors, chiefly those arising from the motion of the sound source, refraction due to temperature inequalities in the air, and the effect of winds. The necessary corrections are tabulated for use in practice.

(b) *Sound Mirrors*.—Some success has been attained in direction-finding by means of concave sound reflectors. The chief limitations have arisen from the question of size, and, consequently, of portability. In optics the size of mirrors commonly in use is very great in comparison with the wave-lengths of the light; in the corresponding problem in acoustics it is almost impossible to make them so; and yet this is a necessary condition for the geometrical laws of reflection to apply with accuracy. In the largest sound mirrors—perhaps 20 ft. in diameter—the size is at most only a few wave-lengths for the aircraft sounds under investigation with the result that the image of a distant sound obtained at the focus proves to be an area much larger than that corresponding to optical calculations. There is therefore no advantage secured by making the mirror paraboloidal instead of spherical, and considerable roughness of the surface is not detrimental. The mirrors were usually made of concrete, and listening was effected either by means of a small horn receiver placed in the focal plane and connected by a tube to the ears, or by means of a microphone placed in a similar position. If, as was more usual, the mirror was fixed, the direction of the sound source could be found by determining the position of maximum intensity in the focal plane. It may be noted that in this method of direction-finding amplification is obtained on account of the area of the mirror, and that further augmentation is attainable by using resonators, to which the same objections do not apply as in binaural listening. The accuracy of the determinations varies very much with frequency, being much greater for notes of high pitch than for low, as would be anticipated from considerations of wave-length.

(c) *Interference and Diffraction Methods*.—There have been many attempts to apply the principle of interference as a substitute for binaural listening, i.e., by ultimately mixing the sounds entering the two receivers, instead of leading them to different ears and adjusting the compensator until the total sound heard is as loud as possible. Theoretically this will occur when there has been provided in the compensator a difference of path equal to the path difference outside the receivers. The method has not proved very successful, for a variety of reasons, some of which are obscure.

On the other hand, remarkable results have been obtained by the application to sound waves of a phenomenon well known in the diffraction of light. A small distant source of light gives in the middle of the shadow of a small circular obstacle a luminous region, called the "white spot," arising from the diffraction of light round the edges of the obstacle. The same phenomenon is observable in sound under suitable conditions. Thus a large horizontal disk, at least 20 ft. in diameter, and made of material which either reflects or absorbs sound, will give below itself a sound shadow of a sound source, such as an aeroplane, above it. Near the centre of the shadow, in a position depending on that of the source, there is a region where the sound heard on a suitable microphone placed there is comparatively loud—in many cases much louder than it would be if the disk were absent. The relation between the direction of incidence of the sound and the position of maximum intensity has been calculated, and the method provides, perhaps, the most reliable means of perceiving the direction of air-borne sounds.

(d) *Sound Ranging*.—This special military aspect of the localisation of sound sources, viz., those arising from gun-fire and shell bursts, is dealt with in the article SOUND RANGING.

## II. DETECTION AND PERCEPTION OF DIRECTION OF SOUNDS IN WATER<sup>1</sup>

Of all the methods practised for the detection of submarines, that depending on the sounds which they emit has been of the widest application. The question of detection has been, of course, of nearly equal importance in the opposite sense, viz.: the hearing of surface ships by the crew of a submerged submarine. The sounds created in the sea by a screw-propelled ship are of a very complicated character, arising partly from the

interaction between the propeller and the water, and partly from the vibrations of the machinery which are transmitted through the walls of the ship into the sea. They vary greatly from ship to ship, even of the same class; and, in the later stages of the War, submarines had been constructed which, when cruising submerged at certain slow speeds, emitted practically no noise at all. In many ways the detection of submarines in the sea is more difficult than that of aircraft in air. Normally, listening in air takes place at stations which are fixed; in submarine listening the stations were most frequently ships which, for tactical reasons connected with their safety, had to be constantly on the move. Their own machinery noise and the acoustic disturbances arising from their motion through the water were very apt to drown the noises proceeding from more distant sources. The noise of the sea, too, even in weather not at all stormy, interfered greatly, and the range at which a submarine could be heard varied much from day to day. A serious additional limitation was that recourse could not normally be had to the reflection of ordinary sounds (as is possible in air) chiefly by reason of the great size of the necessary reflectors. For the speed of sound in sea water is more than four times that in air, so that the wave-lengths are larger in the same ratio. This necessitates a corresponding increase in the linear dimensions of the sound mirror, if equal efficiency is to be obtained.

*Hydrophones*.—Hydrophones, or under-water sound detectors, were already in use before the War for signalling purposes, being carried by ships for listening to submarine bells operated by Trinity House as warnings in foggy weather. They consisted of small, metal, water-tight cases of which one face was a metallic diaphragm operating an enclosed microphone. The electrical disturbances of the microphone caused by any vibration of the diaphragm arising from sound pressure waves in the sea were conveyed to telephone receivers on the ship, where listening took place. It was usual to suspend the hydrophones in water-filled tanks attached inboard to the outer shell of the ship, which, owing to the fact that steel in water transmits sound almost completely, does not diminish appreciably the intensity. Normally the hydrophone diaphragm was tuned so that its natural frequency in water<sup>2</sup> approximated to that of the signalling bell, and so that increased range could be secured by depending on resonance.

The earlier hydrophones used for naval purposes were of much the same type, although the resonant diaphragm proved to be by no means an unmixed advantage. All sounds containing a component corresponding to the diaphragm frequency were distorted in reproduction, and what was gained in sensitivity was liable to be lost in the difficulty of recognition, or, in other words, failure in discrimination between genuine noises due to a submarine and other noises inevitably present in the sea. Appeal to resonance is only really advantageous when the sound under observation has a predominant note, as in the case of an aeroplane; and submarines do not display this characteristic. Ultimately hydrophones of a non-resonant character came to be preferred, and were frequently used in practice. These consisted most usually of enclosures made of rubber, sufficiently thick to withstand the pressure of the sea at the usual depth (about 15 ft.), and having natural frequencies below the limit of audition.

An alternative type of hydrophone consisted merely of a hollow enclosure without a microphone, sometimes with a metallic diaphragm, and sometimes simply a rubber tube, filled with air and connected by long tubes to stethoscopes applied to the ears. These are operated by the transference of the pressure vibrations from the sea to the air cavity and thence to the ears. Electrical hydrophones have the advantage over non-electrical ones that their sensitivity can be readily augmented by various means, e.g., by the use of thermionic amplifiers (see AMPLIFIERS).

In cases where the hydrophones had to be used by ships in motion, they were sometimes fitted into the hull of the ship; or themselves consisted of fish-shaped bodies towed at a considerable distance behind the ship. The former precaution, i.e., making the shape stream-like, aimed at diminishing the vibrations created by the passage of the hydrophone through the water; the latter had in view the partial elimination of the disturbances arising from noises in the towing ship. Even so, it frequently became necessary to stop the engines temporarily, and listen with the towed hydrophones while the momentum of the ship continued to carry it forward. This proved to be feasible only at comparatively slow speeds.

*Directional Hydrophones*.—All the hydrophones so far described are of a non-directional character, i.e., the intensity of the sound heard in them is practically independent of the orientation of the sensitive receiving diaphragm with respect to the position of the source of sound. The limitations of dimensions necessitated by con-

<sup>1</sup> The following publications should be consulted, although they form by no means adequate references: H. C. Hayes, *Engineer*, p. 491 (1920); C. V. Drysdale (Kelvin Lecture), *Journ. I. E. E.* (1920); W. H. Bragg, "Submarine Acoustics," *Nature*, July 1919; F. L. Hopwood, "Submarine Acoustics," *Nature*, Aug. 1919.

<sup>2</sup> This is considerably lower than the natural frequency in air, on account of the additional loading by the water.

siderations of portability, etc., are such as to render the instruments much too small to give an effective "sound shadow." The reason for this has already been mentioned, viz., the great wave-lengths corresponding to audible sounds. At a frequency of 500 per second, for example, the wave-length in water is nearly 10 feet.

**Differential Hydrophones.**—Curiously enough, however, one type of directional hydrophone, here called for distinguishing purposes a *differential* hydrophone, did, in fact, depend upon the small differences of pressure operating upon its two sides; and it met with considerable success. It was made in various forms, the simplest of which consisted of a circular metal diaphragm, bearing at its centre a water-tight box containing a microphone, and clamped round its rim to a heavy metal ring. When placed in the sea so that the plane of the diaphragm passed through the position of the sound source, the pressure variations on the two sides are the same both in amplitude and phase, with the result that the diaphragm, and therefore the microphone, has no motion imparted to it, and the sound heard is a minimum. If, however, the diaphragm faces the sound source, there are, apparently, differences in the pressures on the two sides (probably in both amplitude and phase), and a small differential vibration takes place, with consequent sound in the receiving telephones. Actually, as the hydrophone is rotated through  $360^\circ$  about a vertical axis, two maxima and two minima of sound intensity are observed. In this form, therefore, the instrument is what is called, *bi-directional*, i.e., it is unable to distinguish between sources in *front* and *behind*. The desirability of obtaining a *uni-directional* instrument led to the introduction of the so-called *baffle-plate*, the behaviour of which has not yet been explained satisfactorily in terms of orthodox theory. The essential characteristics of a baffle appear to be that it should be made of non-resonant material and have air cavities within it. Such a plate, fixed at a small distance (which has to be determined by trial) from one face of a bi-directional hydrophone, transforms it into a uni-directional instrument. A single sound maximum is now obtained upon rotation, occurring when the sound source and the baffle plate are on opposite sides of the diaphragm; and a single minimum—this when the baffle lies between the sound source and the diaphragm. The "edge-on" minima, observed when the baffle is absent, now disappear.

**Binaural Listening.**—The principles underlying this method of direction-finding have been described already. In the present case the main difference is that the sound receivers have to be submerged hydrophones. It has been found to be equally necessary for success that these should be as completely as possible non-resonant. The simplest arrangement used in practice was two rubber cavities placed several feet apart horizontally, and joined by separate equal tubes to the two ears. The device could be rotated about a vertical axis, usually passing through the hull of the operating ship. As in the case of air listening, compensators were often used in order to avoid the necessity of rotating heavy apparatus. An arrangement much preferred was to tow two or more fish-shaped hydrophones in known positions (about 12 ft. apart) behind the ship. Here electrical transference of the acoustic disturbances had to be adopted, and this necessitated great care in the choice of the microphones and telephone receivers so as to avoid selective resonance. (The behaviour of microphones in this respect was often unsatisfactory, and telephone earpieces, or magnetophones, were frequently substituted for them. This results in diminished sensitivity, but the binaural effects are much improved.) The telephone receivers delivered the sound into the compensator, and the phase difference was measured in the usual way; allowing, of course, for the difference of speed of sound in the sea and in the air channels of the compensator. In using a compensator with two sound-receiving units only, there remains an ambiguity of estimated direction, i.e., one cannot distinguish between the angles  $\theta$  and  $\pi + \theta$ . The introduction of a third unit, so that the three form a triangle of known dimensions—the units being used in pairs with the compensator—ensures the correct choice between the alternative angles.

**Other Methods of Direction Finding.**—Several other methods of perception of direction, not easy to classify, have found application in practice. One of these consisted in fitting in the shell of a ship, on opposite sides, two diaphragms with microphones attached, arranged so that the hydrophones thus formed were of as nearly as possible equal sensitivity. These were listened to alternately by means of a reversing switch. The ship, on account of its considerable size, was capable of giving a marked sound shadow. Thus the starboard hydrophone would give greater response than that on the port side if the sound source were to starboard, and vice versa. By steering the ship so that the responses were equal, it could be inferred that the course was directed towards the cause of the sound. The limitations of the method were mainly those arising from local noises; and the speed had to be small while listening took place.

In other cases large numbers of sound receivers, usually simple diaphragms whose function was to transfer the vibrations from the sea to the air inside, were inserted in the ship's hull. Good results were obtained by an arrangement of this kind, called the Walser gear, in which the sound receivers were disposed at regular intervals on a large bulge, in the shape of a spherical segment, incorporated in the hull on either side towards the bows. The system acted as a sound lens, a sound focus occurring at a point where the "sound paths" by alternative routes were equal. Application of

the laws of geometrical optics enabled the relation between the position of the focus and the direction of incidence of the sound wave on the ship's side to be determined.

**Sea Sound Ranging.**—The methods hitherto mentioned for perceiving sound direction would all fail when the sounds are abrupt in character, because they all require an appreciable time for carrying out the necessary tests. To determine the position of an exploding submarine mine or torpedo we require, therefore, a different device. A suitable method is one identical in principle with that practised on land. The main variations in applying the device to the sea are that the microphones must be in submerged hydrophones, and that a correct knowledge of the velocity of sound in sea water must form the basis of the calculations. Ordinary non-directional hydrophones of the type first mentioned have proved to be quite sufficiently sensitive, but specially constructed hydrophones, sensitive to shocks and irresponsive to general sea noises, are superior. Indeed, the greatness of the distances at which explosions in the sea have given unmistakable impressions on the recording film has been surprising. Small detonators serve at distances of several miles, while the explosion of 40 lb. of gun-cotton is operative more than 100 m. from the receiving hydrophones. Many experiments have been carried out by the British Admiralty with hydrophones disposed in suitable positions on the east coast of Britain, and the installations promise to be useful, not only for locating mine and torpedo explosions in circumstances of war, but also for navigational and surveying purposes. A ship in fog, for example, could ascertain its position by exploding (with due notification by wireless to the sound ranging station) a small charge near itself in the sea; the station could within a few minutes inform the ship—again by wireless—of its position. (See SURVEYING).

An important additional method, the so-called R-A or radio-acoustic device for locating positions at sea, has been developed since the War by A. B. Wood and H. E. Browne, working for the British Admiralty (see *Proc. Phys. Soc. Lond.*, vol. 35, p. 183, 1923). It consists of measuring the difference of time of reception at shore stations of ordinary wireless signals (which travel practically instantaneously) and sound signals in the sea (explosions) sent out simultaneously from a ship. Both incoming signals are recorded on the same moving photographic film, and such great precision of measurement has been attained that the method has served to check, and sometimes to correct, hydrographic surveys made in the orthodox manner.

Sea sound ranging has necessitated the accurate redetermination of the velocity of sound in sea water. This has been accomplished by the inverse of the processes just mentioned, making use of explosions in accurately known positions.

This velocity and its variations due to temperature and salinity are now known with great precision. For example, the velocity in sea water at  $15^\circ \text{C}$ . containing 35 parts of salt per 1,000 is 4,935 ft. per second.

**Echo Sounding.**—The accurate knowledge of such velocities has led to another remarkable device being designed and used successfully by the British Admiralty. This measures the depth of the sea at any point, and provides a means of survey of the sea bottom far more rapid than is possible by ordinary sounding lines. A description of the method has been given by F. E. Smith, Admiralty Director of Research, in a Royal Institution lecture on "Modern Navigational Devices" (*Proc. Roy. Inst.*, vol. 24, p. 342, 1924). In principle it consists of measuring the time taken for an abrupt sound to travel to the sea bottom and return as an echo after being reflected there. The sounds are made by an electrically operated hammer striking at regular intervals a diaphragm fixed in the hull of the ship; the sound receiver is a non-resonant hydrophone, also suitably immersed in the sea. The timing mechanism, which is of ingenious construction too elaborate to describe here, measures the time of the double sound journey in terms of the angular separation of two disks rotating synchronously on the same shaft. This permits of calculating the sea depth, the velocity being known. An indicator in connection with the mechanism performs the necessary calculation automatically so that the depth can be read off. A most important advantage of the method, in addition to its accuracy, is that the ship carrying out soundings need not stop to do so (see SOUNDING).

### III. AUDITORIUM ACOUSTICS

The acoustics of public buildings have been put on what approximates to an exact scientific basis largely as a result of the work of W. C. Sabine (*J. Frank. Inst.*, 179, p. 1, 1915). For good hearing three conditions are necessary and sufficient. The sound heard must be *loud enough*; the simultaneous constituents of a mixed sound must preserve their *relative intensities*; and the successive sounds must *remain distinct and in the correct order*, and be free from extraneous noises. The extent to which these conditions are fulfilled depends on the construction of the auditorium, its shape, its dimensions and the materials of which it is composed. In already finished buildings radical alterations of the first two are not often feasible, but great improvements can be secured solely by suitable changes in the internal features.

The main difficulty arises from what has been called *reverberation*, due to the multiple reflection of sound at different parts of the room. If the reverberation is prolonged, it means that the rate of absorption of the sound is slow. Thus, in a lecture room at Harvard, where these experiments were commenced, the rate of absorption was so small that a single spoken word continued to be audible for  $5\frac{1}{2}$  seconds. Successive syllables thus had to be heard and appreciated through a loud mixed sound due to the reverberation of many previous syllables, and the conditions of hearing were intolerable. Great reduction of the multiple echoes constituting reverberation can be made by increasing the rate of absorption of sound. It is apparent that, in the space of several seconds, the sounds travelling at 1,100 ft. per sec. will have suffered many successive reflections, and will, therefore, have penetrated to practically all parts of the room. The sound will have become diffuse radiation, and absorbing material introduced almost anywhere will be equally effective in reducing reverberation. An open window proves to be a complete absorber, in the sense that it permits the egress of the maximum possible quantity of sound radiation (*cf.* the properties of a small aperture in an isothermal enclosure in heat radiation). The introduction of cushions, carpets, wall hangings and people also largely diminishes reverberation, because of their considerable absorbing powers. Sabine has made a systematic study of the coefficients of sound absorption of various materials by the inverse method of measuring their effect in reducing the duration of reverberation. Measurements, for example, indicated that an audience gave an absorption equal to 44% of that due to an equal area of complete absorber, thus accounting for the improved hearing conditions that are very often found in well-filled buildings.

The absorption of sound can thus be adjusted with precision, but it must not be carried too far, otherwise the *sound intensity* is too much diminished. The ear is able to disregard, or even to take advantage of, reverberation which is not too prolonged, and the extent of absorption has to be adjusted to the appropriate amount. Too many apertures such as open windows or doors must be avoided.

Sabine has also made examination of the exact manner in which sound is reflected in an auditorium by constructing scale models of the latter, and photographing the sound waves at various instants after creation, using the beautiful method due to Toepler (*Annalen der Physik*, v. 127, p. 556) and elaborated by R. W. Wood (*Physical Optics*, 2nd ed., 1911, p. 94). By this means the positions of the sound waves, both incident and reflected, are capable of observation at all instants and at all points in the model room, and they provide data upon which can be based correct architectural construction from the acoustic point of view.

#### IV. MISCELLANEOUS ADVANCES

*Absolute Measurement of Sound.*—A. G. Webster (Nat. Acad. Sci., *Proc.*, 5, p. 173, 1919) has advanced to a considerable extent the methods of absolute measurement. For this purpose it is impossible to rely upon audition, handicapped as it is by the vagaries of the ear. What is required is a reliable mechanical device, the performance of which is constant, to record the sound vibrations with sufficient magnification. Webster has made an exhaustive study of the properties of various materials, and has constructed from those most suitable for the purpose two instruments which he has called the *phone* and *phonometer* respectively. The "phone" provides a means of creating a simple tone of intensity and frequency which are under control and capable of exact measurement. The phonometer is an instrument for measuring absolutely the vibrations received by it. It consists of the combination of a diaphragm and a resonator, both of which are adjustable in frequency. The motion of the diaphragm is observed by making it a reflector and part of a Michelson interferometer, so that the amplitude is measured in terms of the wave-length of suitable monochromatic light. In practice the interference fringes are photographed on a moving film upon which they appear as wavy lines. Against this instrument, which is regarded as a standard, other portable phonometers can be calibrated, these depending on the simpler process of

the deflection of a beam of light set into angular oscillation by the receiving diaphragm. With such instruments and also with D. C. Miller's *phonodeik* (referred to later), L. V. King has carried out an elaborate investigation on the propagation of sound in air and fog-signal efficiency (*Phil. Trans.*, v. 218, p. 211, 1919) in the region near Father Point, Quebec. King, in this paper, also describes a modification of the siren called the *diaphone*, used as a standard source of sound in his research.

*Analysis of Sound.*—Webster's phonometer described above is a resonant instrument, and, therefore, unsuitable for the analysis of mixed sounds. Much progress has been made, however, in the analysis of such sounds, using non-resonant recorders—for example, D. C. Miller's *phonodeik*. This instrument, which depends on the motion imparted to a tiny mirror by the operation of a vibrating diaphragm, is described in Miller's *Science of Musical Sounds* (1916), where also will be found the results of the analysis of various sounds. In such instruments the sound record is of the ordinary type, and consists of the trace on a moving photographic film of a spot of light vibrating at right angles to the motion of the film, thus forming a transverse wave. Records of a different type have been obtained by A. O. Rankine (*Proc. Phys. Soc. Lond.*, v. 32, p. 78, 1919 and *Nature*, v. 108, p. 276, 1921), in which the sounds are caused to vary the *intensity* of a narrow beam of light, which gives on a moving film a line image perpendicular to the motion. The record thus consists of a negative film of varying transparency along its length. It is not so suitable as transverse records for direct analysis of the component frequencies, but it has the advantage that it admits of *reproduction* of the sound by means of a selenium or other photoelectric cell, such as is used in phototelephony. This arrangement constitutes a novel type of phonograph operated by light, first invented by Ernst Ruhmer in 1900, but hitherto little known.

Mainly owing to the demands of wireless broadcasting (*q.v.*), the question of the composition of sounds, particularly speech sounds, has become acute, and many investigations on this subject in relation to more perfect telephonic reproduction have been carried out since 1922. There has been besides a remarkable advance in our knowledge of the structure of speech due to the work of Sir Richard Paget (*Proc. Roy. Soc., A.*, v. 102, 1923, and 106, 1924), who has examined systematically by direct listening the component characteristic frequencies of vowel sounds in particular and, to some extent, consonants also (*see VOICE SOUNDS*). The accuracy of these observations is established by the fact that speech sounds have been imitated artificially by employing the appropriate frequencies, and a speaking machine, consisting of the hands, a reed and bellows, called the *cheirophone*, has been evolved.

*Speaking Films.*—Progress has also been made in the application of photographic sound records, in conjunction with photoelectric cells, as mentioned above, to the synchronous reproduction of pictures and sounds (*see Nature*, v. 108, p. 276, 1921). Bergland in Sweden, Masolle, Vogt and Engl in Germany and De Forest in America appear to have been the principal experimenters, and De Forest *phonofilms* are now (in 1926) to be seen and heard in certain British picture theatres. In this particular phonofilm the sound record, which is of the varying transparency type, occupies a strip about  $\frac{1}{16}$  in. wide on one side of the picture series. It is made by sounds acting microphonically on the luminosity of a special lamp to which the moving film is exposed through a slit. For reproduction a photoelectric cell, under the influence of the fluctuations of light caused by the developed film record, operates loud-speaking telephones, the necessary intensity being secured by sufficient valve amplification. The pictures and the corresponding sound record being on the same film, synchronism is perfect, even after the fracture and repair of the film which frequently occurs in practice. What one sees and hears are, of course, but imitations of the original appearances and associated sounds, but the double deception of the eye and ear is in fact almost, if not quite, complete. The phonofilm reproduction *lives* more nearly than the silent moving picture.

Sabine, *Collected Papers on Acoustics* (1923); H. Lamb, *The Dynamical Theory of Sound*, 2nd ed. (1925). (A. O. R.)

**SOUNDING** (see 25.460).—From the year 1911 until the commencement of the World War there was no improvement in the methods of deep-sea sounding; but certain advances were made in connection with sounding in shoal water, the best known British systems being called after their originators, "Douglas-Schäfer" and "Somerville"; these two appliances are now fitted in all British surveying vessels, and enable accurate and rapid soundings up to 30 fathoms to be obtained easily when the vessel is steaming at the rate of about four knots. Both methods use a wire traveller carrying a lead between the stern of the vessel and a spar projecting from the bows, and entirely prevent the entry of the lead into the water until it is disengaged at its greatest distance forward, thus enabling a vertical sounding to be obtained as it passes the stern.

**Effect of the War.**—During the five years of the War original methods of sounding were not improved upon, this being largely due to the lack of time for experimental work in this direction, and also because after the War, and even now (1926), certain nations still treat certain war inventions, to some extent, as confidential. Perhaps the non-circulation of such information may be due to the aversion to publication of imperfect data, as well as to the necessity for safeguarding commercial rights to entirely novel appliances.

Although not directly applicable to the subject of ocean sounding, reference must now be made to subaqueous sound-ranging, a form of the utilisation of sound-waves which proved eventually to have such a remarkable effect upon the former. Subaqueous sound-ranging is of distinctly higher accuracy than that through air, owing to the velocity of sound through water being considerably greater and comparatively unaffected by extraneous causes; in water, sound travels at about 4,900 ft. per sec., which is more than four times its rate through air.

This method of obtaining a distance by sound was used largely in connection with the detection of submarines, and was invaluable in accurately fixing a position which could not have been ascertained otherwise. Sound waves were also utilised for locating the explosion of mines and for fixing any positions at which a small explosive charge was fired intentionally. After such an explosion the sound travelled through the water to two or more sets of suitably placed hydrophones whose positions were accurately known and which were connected to organised shore stations; after the reception of the sound of the explosion by the hydrophones, not only was its approximate distance obtained, but, by mathematical calculation, a line of direction was also given. Thus the combination of these distances and lines of direction from two or more hydrophone stations gave the position of the explosion with considerable accuracy. In practice when used in the North Sea the results were obtained without difficulty up to about 200 miles. The greatest distance for which this method was utilised was in the case of obtaining the position of vessels sunk during the battle of Jutland, which was nearly 300 m. from the English coast.

The value of this method in obtaining accurate and rapid positions for sounding purposes in connection with the numerous minefields in the North Sea cannot be overestimated, and its enormous utility is especially realised when the thick weather which is so prevalent there prevents the taking of all astronomical observations, and, further, when most of the positions were out of sight of land.

**Utilisation of War Methods for Purposes of Peace.**—On the termination of the War, inventions which had been utilised during its progress were turned, when possible, to the purposes of peace, and a large amount of material and knowledge gathered together in connection with subaqueous sound-ranging were gradually utilised in the direction of sounding, and in this special field the utilisation of acoustic sounding in substitution for the direct measurement of oceanic depth is its practical result.

**Echo Sounding.**—This new method is known as echo sounding, and depends upon the principle that any sound originating at or near the surface travels through the water at a known speed, and after striking any large object or the bottom of the sea is reflected back to the surface, the time between the emission of the sound and its reception back again being a matter for accurate measurement.

While the value of 4,900 ft. per sec. may be taken as the average velocity of sound in water, it is obvious that the question of an exact value of this measurement is a most important item in this connection. Experiments are being carried out by several nations on this subject, which involves questions of depth, density, temperature, salinity, etc., all of which play a vital part in these investigations.

The perfection of some means of obtaining an accurate measurement of the time from the moment when the sound is first produced until its echo is received back is therefore the practical problem to be solved satisfactorily, and if a form of apparatus carrying out the above requirement is produced, a succession of measurements, i.e., soundings, can be obtained easily.

**Experimental Work.**—Several nations are known to have carried out much experimental work in the perfecting of such an apparatus as is required—France, the U.S.A., Germany and Great Britain are those especially prominent in this direction, and each nation's investigations have resulted in evolving its own special form of apparatus for carrying out echo sounding; in this article, no attempt has been made to describe the devices of the various nations; the whole subject is at this date in an experimental stage, and it appears more than doubtful if any of the existing appliances will survive the test of time in their present form.

**Use of System by French.**—The French hydrographic service was the first known to have made practical use of echo sounding, and in April 1922 one of its surveying vessels ran a line of echo soundings across the Mediterranean from Marseilles to Philippeville in Algeria, these soundings being required in connection with a projected submarine cable. The existing recorded depths were found to be very similar to those obtained, and the result generally was most successful; the majority of the depths were slightly under 3,000 metres (about 1,000 fathoms). The acoustic apparatus employed by the French was invented by Monsieur Marti, a hydrographic engineer of the French Navy. All the surveying vessels of the French Navy are fitted with some form of sonic sounding apparatus, and the apparatus is also supplied to some of the larger vessels of the Navy itself.

**Utilisation by U.S.A.**—In June 1922 the U.S.S. "Stewart" ran a line of echo soundings from American waters to Gibraltar; the voyage occupied about nine days, during which about 900 soundings were taken, the depths varying up to 3,200 fathoms, and the time between the soundings usually being about 20 min.; no difficulty whatsoever was experienced in taking these soundings, and the speed at no time was reduced for this purpose; the average speed was 15 knots. The apparatus used on this occasion is called the "Navy Sonic Depth Finder," and was developed by Dr. Hayes at the Engineering Experimental School at Annapolis, Maryland.

At the latter end of 1922, two American vessels were fitted with a similar form of apparatus for echo sounding, and carried out an extensive bathymetrical survey off the west coast of North America, at the request of the Carnegie Institution of Washington. About 5,000 soundings were obtained during the survey, and the resulting chart has proved of great value in connection with those disturbances which have been unfortunately so prevalent on this coast. In those regions in which land changes occur frequently, their study will be immensely advanced by a greater knowledge of the off-lying ocean depths, now rendered feasible by this new form of sounding. In the year 1923 an American cruiser was fitted with the sonic depth finder and crossed the South Atlantic to the Cape, and thence proceeded up the East Coast of Africa. The apparatus was in constant use during the whole voyage, its results being found in close agreement with the existing soundings on the chart; and from a

navigational point of view it proved of great value, especially in the dangerous vicinity of Cape Guardafui, which was rounded by its means during thick weather which entirely prevented land being sighted. A sonic depth finder is now fitted in several ships of the American Navy for navigational purposes; and in all surveying vessels.

**German Apparatus.**—Mention must now be made of a German apparatus, invented for the purpose of obtaining sonic depth soundings, by Dr. Behm. A study of the question of submarine explosions and their reflection from the bottom of the sea was commenced for this purpose by him about the year 1912, but further improvements are required before the invention can be described as being a practical success.

**Use by British Navy.**—The British Navy have now perfected an apparatus which carries out all the necessary purposes of the sonic depth finder; it is comparatively simple in character; no calculations are required, the actual depth being read directly on a dial. This apparatus is produced in two patterns, the first being for use in comparatively shoal water and a second for obtaining deep-water soundings; the first is quite sufficient for the purposes of ordinary navigation, while the second is suitable for hydrographic, oceanic investigation and for submarine cable requirements. All British surveying vessels in home and foreign waters are now fitted with the latter apparatus.

Reference must be made to the utilisation of ultra-sonic waves by Professor Langevin, of the Paris University, in connection with deep-sea sounding. This method makes use of sounds in water which are comparable with the Hertzian waves of the air. There appears to be a great deal to be said in favour of this apparatus, but more experiments with it are required before it can be said to be a complete success. In spite of the undoubted success of echo sounding in obtaining deep-sea measurements, the old apparatus for wire sounding will be required for oceanographic investigations, as specimens of the bottom temperatures and salinity will still be necessary, but the number of such observations will be very small compared with those required for deep-sea sounding.

Since 1874 the method of sounding by wire as described in Vol. 25, 461, has been in practice, and was, in its turn, an immense step over the former clumsy method of utilising hemp; but the advantage of echo sounding as compared with that by wire is so enormous that practically there is no comparison. In the present case the apparatus is unlikely to be damaged in any way, whereas under old conditions not only was it extremely likely that the apparatus itself might be injured, but the loss of both wire and lead was unfortunately not infrequent. The time necessary for obtaining a sounding is almost infinitesimal, the sounding in extreme depths taking little more time than one in the shallowest water. The speed of the vessel is maintained throughout the soundings, and the soundings themselves may be accurately taken at extremely short intervals. Bad weather does not affect the work, the complete apparatus is of moderate cost; and if even this were gradually lessened could be fitted in all ocean going vessels, and become therefore as useful for general navigation purposes as in the special fields of hydrography and oceanic research. See also SURVEYING, NAUTICAL. (J. P.)

See *The Hydrographical Review*, vol. 1, 2 and 3, published by the International Hydrographical Bureau, Monaco.

**SOUND RANGING.**—The method of locating hostile guns by the sound, or sounds, consequent on their discharge was introduced on the British front in France during 1916. It works as well at night or when, owing to fog, mist or smoke, the visibility is poor as on clear days; it can detect batteries so well hidden as to be invisible from the air or on air photographs; it is always ready when once the apparatus has been installed; and a location can be obtained, under favourable conditions, within a minute or two of the arrival of the report of the piece. The chief disadvantages of the method as used in the World War were that the installation necessitated the laying and maintenance of several miles of wire; that the method would not work well during a heavy bombardment; and that certain weather conditions, to be specified later, rendered location almost impossible.

The two latter difficulties seem insuperable. The wiring trouble can be minimised in two ways: either by devising a method of wireless transmission of the signals from the instruments to the central station, which is quite feasible, whatever the practical difficulties in reducing the weight and cost of the apparatus to reasonable limits may be; or by modifying the method of time recording so that much shorter bases can be employed. Considerable progress has been made in this direction. The method has been elaborated to permit the directing of fire on a hostile piece by comparing the record of the sound of discharge of the piece with that of the burst of the shell directed against it. With 12-in. and 9.2-in. howitzers destructive shots have been directed very successfully by sound ranging.

**Principles.**—The method generally adopted in the British, French and American armies is to record the instant of the arrival of the sound made by the hostile piece at certain fixed and carefully surveyed posts, spaced at intervals varying from 1,000 to 2,000 yards. If it be assumed that the sound spreads out from the source with a known velocity, the same in all directions, then a known interval between the arrival of the sound at two fixed posts will determine a curve on which the source must lie. This curve is a hyperbola with two posts  $P_1$  and  $P_2$  as foci, for the determining condition is that the difference of the radii vectors  $SP_1$  and  $SP_2$  be constant. If, in addition, the time of arrival at a third post be known, then the interval between this and the time of arrival at either  $P_1$  or  $P_2$  will fix a second hyperbola on which the source must lie, and so determine the position of the source. In practice three posts are not sufficient, since any uncertainty caused by the recording of a spurious sound at a post would falsify the location. In general six posts are used, which, taken consecutively in pairs, give five lines which should all intersect at one point. Any accidental selection of the record of a spurious sound at one or more of the posts is then at once detected by the non-intersection of the curves. Records of the sound at five, or indeed four, of the posts are generally sufficient for the experienced sound ranger, even when several guns are being recorded at short intervals, so that the use of six posts allows for the sound not being successfully recorded at one or two of the posts.

**Instruments.**—The instruments comprise: (a) detectors, placed at each of the six surveyed posts, which give an electrical response to the arrival of the sound, and (b) a recording instrument, placed at a central station and connected by a separate circuit to each detector, which registers the exact time at which each detector responds.

(a) The method described assumes that the sound travels out from the source in all directions with the same velocity, which is true of the sound of discharge of the piece. The passage of a projectile through the air with a velocity greater than that of sound gives rise, however, to the so-called "shell-wave," which travels with a velocity above the normal in the forward direction, the velocity being greatest along the line of fire. (This "convection" of sound by the shell, if it may be so named, was explained by Mach and others as long ago as 1889.) The ear and the ordinary carbon microphone, if situated some distance in front of the piece, usually hear the shell-wave better than the sound of discharge. For sound-ranging a special type of microphone, particularly sensitive to the low frequency disturbance of the sound of discharge, was invented by Maj. W. S. Tucker.

It depends on the principle utilised in the hot-wire anemometer, i.e., the change of electrical resistance consequent on the change of temperature of a heated wire which ensues when the air round it is set in motion. A very fine wire of platinum, whose resistance at atmospheric temperature approaches 100 ohms, is mounted in the form of a grid over a circular hole some seven mm. in diameter. It is included in one arm of a bridge circuit, and sufficient current passed through the network to heat the wire to a dull red. The bridge is balanced so that when the air round the wire is undisturbed no current passes through the galvanometer. Motion of the air causes the resistance of the wire to decrease, upsets the balance, and so causes a current to pass through the galvanometer.

The microphone wire is mounted in front of an air container of some 16 litres capacity. The instrument so completed is insensitive to all sounds of speech, musical sounds, traffic or even rifle fire. It responds readily, however, to gun sounds (which are low frequency disturbances) even when they are inaudible, and records also the shell-wave. Its reaction is very rapid, and the small lag which does occur appears to be the same for all similarly constructed instruments.

(b) The recording instrument used is the Einthoven galvanometer, in which the moving part is a very fine wire (through which flows the current to be detected) mounted in a magnetic field. The wire moves in a direction normal to its length and to the direction of the field. Six wires, insulated from one another, and provided with separate terminals, can be mounted side by side in the field produced by a single small electromagnet. This provides in a small space what is essentially six independent galvanometers, one of which is included in the bridge belonging to each microphone. As the sound reaches successively different microphone posts the corresponding galvanometer wires move in rapid response.

The instant at which each wire begins to move is registered on a moving photographic film or sensitive paper strip. The camera in which the film runs vertically is furnished with a horizontal slit, a cylindrical lens in front of the slit reducing its effective breadth. Shadows of the perpendicular galvanometer wires, cast by means of an electric lamp and an optical system mounted in the pierced poles of the galvanometer magnet, fall on the slit, and are focused on the film, appearing there as six points of shadow on a horizontal line of light. As long as the wires are still each point leaves on the running film a straight line; the movement of a wire registers itself as a break in this trace. A special device, by which a tuning-fork effects a periodic interruption of the light beam, records a time scale on the film itself, so that the distance between parallel lines on the film corresponds to a given time interval whatever be the rate at which the film is running.

Originally the film was cut off after the required record had been taken, and developed in a small dark room adjacent to the instrument. Later a method of automatic development was devised, by which the film passed successively through developer and fixer while running, and emerged ready for interpretation.

*Influence of Weather Conditions.*—The method in use demands that to every time interval shall correspond an exact distance, a standard velocity of sound being assumed which corresponds to some standard temperature, and still air. The intervals measured have, therefore, to be corrected for the prevailing temperature and wind; the velocity of sound is independent of the pressure. It is found that the temperature and wind which are concerned in these corrections are not those prevailing at ground level, but at a height of between 250 and 500 ft. up.

Owing to the refraction of sound by wind the record of a given sound at ground level is greatly influenced by the variations of wind velocity at different heights above the ground. This wind gradient determines largely whether the conditions are favourable or unfavourable for the detection of sounds. In the case of a wind increasing in velocity with height, a following wind, besides increasing the velocity of the sound, tilts the wave front so that the sound converges on the listener or instrument on the ground, and is well heard. An opposing wind causes the sound to tend to pass upward and leave the ground. Hence a wind blowing from the instruments toward the hostile piece often renders sound-ranging almost impossible if it be of any strength. The temperature gradient also affects the refraction of sound.

*Work in the Field.*—It is not feasible to have the film running continuously during any period when records are expected. It should be started a second or two before the sound reaches the first microphone. In the field this is effected by having two forward observers in front of the line of microphones, so placed, one to each flank, that either the one or the other of them must hear the sound of the hostile piece a few seconds before it reaches any of the microphones. These observers are provided with keys, the depression of which starts the film running.

The microphones may be placed anywhere where the hearing is good: the only obstacles which seem to cast sufficient sound shadow to affect them are high hills just in front of them. They may be put in shallow depressions dug for them, and should be protected from splinters, and also from wind and draughts. Canvas and hurdles may be used for this latter purpose without appreciably affecting the sensitiveness of the instruments.

*Ranging on Hostile Pieces.*—A heavy burst near a hostile gun position will furnish a sound record of its position just as does the gun itself. Fire may be directed on a piece which is in action by comparing the records which it supplies with those of the bursts of one's own answering shell. Since both gun and burst are located by the same method all uncertainties introduced in an ordinary location by ignorance of the precise atmospheric conditions are eliminated.

A differential method is adopted, the difference of times of arrival of the sound of the hostile gun and of the friendly burst at each microphone being plotted as ordinates against a certain simple function of the relative positions of the microphones and the hostile gun as abscissae. A horizontal line then corresponds to a direct hit; a straight line sloping to left or to right to an error of line to one side or the other; a curve (approximately an elliptical arc) convex or concave downwards to an error of range. The magnitude of the corrections necessary is easily estimated from curves previously prepared (see ARTILLERY).

(E. N. DA C. A.)

**SOUSA, JOHN PHILIP** (1854– ), American bandmaster and composer, was born at Washington, D.C., Nov. 6 1854. Studying the violin from an early age, he appeared at the age of 11 as a solo violinist, and played in various orchestras, also acting as conductor. In 1880 he was appointed leader of the band of the U. S. Marine Corps, serving in this capacity till 1892, when he resigned in order to organise Sousa's Band. Under his directorship this band rapidly acquired a foremost position in the United States; and made several successful tours of the world. On May 31 1917 he was appointed lieutenant-commander in the U.S. Naval Reserve Force and assigned as musical director to the naval training station, Great Lakes, Illinois. As a composer of marches he acquired an international reputation, among his greatest successes being *The Washington Post, Stars and Stripes Forever, Hands Across the Sea; Thunderer and King Cotton*. He also composed the music for a number of comic operas, including *El Capitan* (1896), *The Charlatan* (1897) and the *Bride Elect* (1898). In 1890 he published *A Compilation of the National Patriotic and Typical Airs of all Countries*.

**SOUTH AFRICA, UNION OF** (see 25.463).—Since the conquest of German Southwest Africa by Union forces in 1915, the whole of South Africa, except for the Portuguese territory on the East Coast south of the Zambezi, has been under British administration. Including Northern Rhodesia, which is, however, geographically in East Central Africa, the total area is approximately 473,954 square miles. The population in 1921 was a little over 11,000,000, and of this total the whites numbered about 1,600,000. Apart from the Portuguese territory the political divisions are (1) the Union of South Africa, established in 1910 and consisting of the former colonies of the Cape, Natal, Orange River (Free State) and Transvaal; (2) the colony of Southern Rhodesia; (3) the territory of Southwest Africa, governed under mandate by the Union; (4) the native territories or protectorates of Basutoland, Swaziland, Bechuanaland, and Northern Rhodesia, governed by the Colonial Office. All the regions named are noticed separately; the present article deals specially with the Union of South Africa as an entity. The Union is a self-governing dominion of the British Crown (for details of constitution see 25.467–468). The population in the census years 1911 and 1921 was as follows:—

| Year | European  | Native    | Asiatic | Mixed & others | Total     |
|------|-----------|-----------|---------|----------------|-----------|
| 1911 | 1,276,242 | 4,019,006 | 152,309 | 525,837        | 5,973,394 |
| 1921 | 1,519,488 | 4,699,433 | 163,896 | 545,548        | 6,928,580 |

In 1921 the whites formed 21.9% and the natives 67.8% of the total population. Of the Asiatics 161,339 were Indians and of the Indians 141,336 lived in Natal. Of those classed as "mixed and others," the majority were the class of mixed European and native descent, known as coloured persons (or Cape boys). The great majority of them live in the Cape Province. The returns of religions in 1921 gave the Dutch churches 603,898 European members, equal to 54.37% of the white population, an indication that Afrikaners of Dutch descent outnumber the British descended Afrikaners. (F. R. C.)

### I. POLITICAL HISTORY

The year 1910 saw the attainment of what for half a century had been the recognised goal of South African statesmanship, both British and Dutch: the union of the Colonies and (former) Republics under a common administration. With this achieved, it was confidently hoped that a country vexed throughout the 19 century with the frequently recurring wars which culminated in the desolating conflict of 1899-1902 would at last enter upon an era of racial reconciliation and assured material progress. These natural expectations have not been altogether fulfilled. Rather it would seem that under the Union the course of South African history has remained true to type: alternately stagnant and tumultuous, diversified by strange and unexpected events, but always replete with interest and instruction for the statesman and the student of human affairs.

The 15 years (1910-25) under review fall into three well-defined periods. Of these the first (1910-14) is distinguished by the activities appropriate to the substitution of a single central administration for the four Colonial Governments which it replaced; the second (1914-9) by the World War; and the third (1919-25) by the new conditions to which the War gave rise.

### THE TRANSITION

With the opening of the first Union Parliament (Nov. 4 1910), the administration of the new Dominion passed to a predominantly Dutch ministry. The party candidates elected to the House of Assembly, and the composition of the ministry, must be recalled; since they provide the necessary starting point from which the subsequent formation of parties can be traced. The 121 constituencies returned (Sept. 15 1910): South African party (Het Volk, Oranje Unie and Afrikaner Bond), 67; Progressives (mainly British), 40; Natal Independents, 10; Labour, four. The Executive Council (or Cabinet) consisted of: Gen. Botha (Prime Minister and Minister of Agriculture); Mr. J. W. Sauer (Railways and Harbours); Gen. J. C. Smuts (the Interior, Mines and Defence); Gen. J. B. M. Hertzog (Justice); Mr. H. C. Hull (Finance); and six others. Of the 11 Ministers four were British. The Opposition, on the retirement of Sir Starr Jameson,<sup>1</sup> was led by Sir Thomas Smartt. The Labour party was led, then as now, by Col. F. H. P. Creswell, the strenuous advocate of the extended employment of white labour in the mining industry.

*Administrative Readjustments.*—Certain of the administrative readjustments involved in the union of the four Colonies had been made in the interval between the coming into force of the Constitution Act (May 31 1910) and the meeting of the first Union Parliament. The assets and revenues of the constituent Colonies and the administration of native affairs passed at once to the (provisional) Union Executive; and a common Judiciary, with common Courts of Justice, was set up. The adoption of the new electoral system, with provision for the quinquennial redistribution of seats, necessarily preceded the Union and provincial elections; and the provincial councils and executive committees had come into being *pari passu* with the Union Parliament and Ministry. But the Act had left the task of completing the administrative machinery of the Union to the central Government which it created. In particular it remained for Gen. Botha's Ministry to carry out the great economic reform of eliminating the practice, hitherto necessary, of using the State railways as agencies of taxation; to amalgamate and reorganise the four existing civil services; and to apportion the revenues of

the (former) Colonies—other than their railway and harbour revenues—as between the provincial and central administrations of the Union. As, moreover, the readjustments necessary for these purposes had been the subject of discussion and ultimately of agreement between the respective delegacies of the four Colonies at the national convention (1908-9), both the nature of the readjustments and the principles and methods to be pursued in bringing them about had been laid down in the Act. It remained also for Gen. Smuts in the second year of the Union to amalgamate the existing colonial militia and volunteer forces, and reorganise and expand them into a system of national defence. In preparing the South Africa Defence Act, 1912, by which the new Dominion was provided with a citizen army, the Union Defence Minister was assisted actively by Lord Methuen, whose command of the Imperial forces in South Africa was extended for the purpose, and by Rear-Adml. Bush, the commander of the South African naval station.

Apart from the avoidance of a ruinous railway and tariff war between the inland and coastal colonies, the great material gain expected from the Union was the reduction of taxation to be effected through the substitution of one for four administrations. The Transvaal, in addition, looked to the fall in the cost of living on the Rand which was to come from the management of the railways and harbours on "business principles" by a Board independent of political interference,<sup>2</sup> as a *quid pro quo* for the surplus millions it had brought to the Union Exchequer. In view of these expectations, it is not surprising that the first serious criticism of the Government, and the first division in the Ministerial ranks, were occasioned by these administrative readjustments.

On the whole, the reorganisation of the civil service, and the adjustment of the financial relations of the Union and the provinces, were effected without impairing the good results of the co-operation of the British and Dutch leaders in the national convention, or challenging the political convictions of the Progressives. On the other hand, the reorganisation of the railways led to dissension in the Ministry itself. The Finance Minister, Mr. Hull, who was familiar with the conditions of the Rand (the great industrial and importing centre of the Union), being dissatisfied with the policy of Mr. Sauer, the Minister of Railways and Harbours, resigned, and in June 1912 the Ministry was reconstituted. Mr. Sauer, transferred to the Ministry of Agriculture, was replaced by Mr. Burton, a Natal Englishman; Gen. Smuts became Finance, as well as Defence, Minister; and by these and other changes the Cabinet was reduced from 11 to nine.

During the recess a more fundamental dissension appeared. Speaking in the Transvaal early in Dec., Gen. Hertzog declared that "when the proper time came South Africa would look after its own interests first and those of the Empire afterwards." This speech was held by Gen. Botha to be incompatible with the Government's policy of racial reconciliation and offensive to the British-minded South Africans who supported it. As, however, Hertzog denied this and declined to resign, Botha himself resigned (Dec. 14 1912). On Feb. 5 1913, at a full meeting of the Government's supporters, Botha's leadership was confirmed by a large majority while Hertzog became the head of the dissident minority of "pure Afrikaners." Before the end of the session the resultant Nationalist party, on a motion of "no confidence," moved in the Assembly by a Labour member (June 16), commanded 42 votes as against the Government's 68.

*Disturbance on the Rand.*—The efficiency, as well as the consistency, of Botha's rule was tested in the same year by two considerable civil disturbances. A trivial industrial dispute between the managers and the white employees of a Rand mine on May 20 developed into a revolutionary movement so threatening that, on June 29, the Government requested and obtained from the Governor-General (Lord Gladstone) the assistance of the British regulars. On July 4, at Johannesburg, the Park railway station and the offices of the *Star* were set on fire with incendiary bombs, and on the next day, after due warning, the troops fired upon, and dispersed, the rioters. The Witwatersrand Disturbances

<sup>2</sup> In the almost total absence of navigable waterways, cheap and convenient carriage by rail is of exceptional importance.

<sup>1</sup> He died during the War.

commission (constituted July 14) found that the trade union leaders had been dominated by revolutionary socialists. It was a Syndicalist movement. A compromise, in which all that the (white) miners demanded was not conceded, was followed by the threat, and postponement, of a general strike; by two further commissions; and by the promise to remove valid grievances by remedial legislation. But the smouldering discontent which this compromise left on the Rand was kindled afresh by a strike among the coal miners in Natal, and when in Pretoria, on Jan. 7 1914, a strike of all workers under the Railway and Harbour Board was ordered, the Trades Federation at Johannesburg decided to take "sympathetic action" and ordered a general strike of the white workmen throughout the Union. By this time, however, Botha's Govt. had completed their preparations. Martial law was proclaimed. Smuts swiftly mobilised his new citizen army. Everywhere the call was obeyed; and the Minister of Defence was not found wanting. All necessary equipment was ready for the British townsmen at the depôts, and the burghers rode "with new rifles and belts full of cartridges" to their rendezvous. The red flag flown over the trades hall in Johannesburg was lowered at the sight of a field gun in position; and the executive of the trades federation were lodged in gaol. At a cost of two lives (lost accidentally) the Government had won; and the ease and completeness of their victory brought the Syndicalists into ridicule and contempt.

Then a step was taken which aroused public criticism and provoked resentment among the (white) workmen in the Transvaal. Nine of the Syndicalist leaders were removed from the custody of the law, placed on board the "Umgeni" in Durban harbour, and sent back to England. The justification for this action was given by Smuts. Syndicalism was a new offence, for which the law of treason, derived from past centuries, provided no appropriate punishment. The Government, therefore, had to go outside the law and itself devise a penalty to meet the changed conditions of to-day. The plea was accepted. The Indemnity Bill, in which also the deported men were declared "prohibited immigrants," was passed in the Assembly by 70 to 12 votes, and received the Governor-General's assent on March 19. Two results of this disturbance must be noticed. (a) In conformity with the Government's pledge, before the session ended (July 7 1914) Workmen's Compensation, Protection of Workmen's Wages, Miners Phthisis (strengthening the Act of 1912), and Law of Riot Acts were passed. (b) The failure of revolutionary methods, and the resentment aroused by the deportations, fostered the growth of the Constitutional Labour party. From 1914-7 Labour was in power, though declining office, in the Transvaal Provincial Council; and in the general election of 1920 it secured 21 seats in the Assembly.

*Racial Questions.*—The second disturbance involved a problem which still (1926) awaits solution. In the Union, where the white population is outnumbered by the "other than white" in the proportion of one to four, there is a general conviction among Europeans that all livelihoods suitable for them should be protected from the encroachment of the non-European races; and in 1913 the Government passed an Immigrants' Regulation Act prohibiting all further Asiatic immigration. Although the Act did not discriminate against Indians as such, their interests were directly affected. The status of British Indians was no new question in South Africa. So impossible was it to reconcile the self-preserving dictates of the European community with the claims of Empire citizenship, that the Crown Administration of the Transvaal had done little more than President Kruger to give effect to the unassailable equity of the Colonial Secretary's dispatches on the treatment of British Indians in that colony. In 1907-8 legislation restricting Asiatic immigration evoked a campaign of passive resistance. Under the new Act not only immigration from India, but the inter-provincial migration of Indians then in the Union, was prohibited. Its enactment was followed by a march of Natal Indians to the Transvaal, in the course of which many Indians were arrested, and Mr. Gandhi and other leaders were put in prison. Strikes of Indian workers on the plantations and mines of Natal led to rioting in which

Indian lives were lost. The India Office and the Government of India protested; and, as in the case of the Rand disturbances, a Commission of Inquiry was set up. The report (March 17 1914) recommended the removal of certain administrative grievances and of some specific disabilities imposed by the Act,<sup>1</sup> and these recommendations were accepted by the Viceroy. Subsequently an Indian Relief Bill was passed; and before prorogation (July 7) an agreement between Smuts and Gandhi, in which further administrative concessions were granted, was made public. The Relief Act and the Smuts-Gandhi agreement together constituted the "settlement" of 1914. "In South Africa," said Lord Gladstone, "the bill was an act of justice. But in the Imperial interest it was an urgent necessity."

#### THE WORLD WAR

The military operations carried out by South African troops in the World War (Aug. 4 1914-Nov. 11 1918) are related elsewhere. The campaigns in which South Africans were especially interested are treated under SOUTHWEST AFRICA and EAST AFRICA, while for the part played by South Africans on other fronts reference must be made to WESTERN FRONT and other War articles. But certain aspects of the period must be noticed here. To the majority of both Dutch and British the issues of the conflict were quite clear. The Union campaign against German Southwest Africa, said Botha (July 24 1915) was undertaken "for the same reasons as hostilities were entered upon by the Imperial Govt. against Germany—to maintain the principles of truth and justice, and the honour once pledged by a nation." But there was a minority among the Dutch Nationalists who, although they had no great liking for Germany, were encouraged by her early success in France to seize what they regarded as an opportunity of liberating South Africa from British rule by her assistance.

*The Maritz Rebellion.*—The rebellion (Sept.-Dec. 1914) was the culmination of efforts pursued by Germany since her occupation of the southwest coast in 1884, the purpose of which was to convert Africa south of the Zambezi into a "Greater Germany." S. G. Maritz, an officer in the Active Citizen Force, and the instigator of the rebellion, had begun to negotiate with the Governor of Southwest Africa in 1913, and before war was declared he had learnt what arms and ammunition would be placed at his disposal. It was the German offensive, and but for the "miracle of Botha" it might have plunged South Africa into a second internecine conflict even more disastrous than that of 1899-1902. As it was, the energies of the Government were absorbed for three or four months in crushing the rebels and foiling the German plans for concerted action with them; and thus the rebellion, besides causing considerable bloodshed and an additional expenditure of some millions of pounds, postponed the active prosecution of the campaign against German Southwest Africa until Feb. 3 1915, and the conquest of the colony until July 9.

But although the Union was the only State within the Empire in which British subjects took up arms on behalf of Germany, its Ministers were to be at least as closely associated with the United Kingdom Govt. in the conduct of the War as those of any other self-governing Dominion. Botha and Smuts, in common with other oversea Ministers of the Crown, were members of the Imperial War Cabinet constituted in 1917. Smuts, however, not only commanded the British forces in German East Africa (Feb. 19 1916-June 20 1917), but alone of Dominion statesmen was a member of the British War Cabinet of six. He was there, no doubt, in part as a representative of the Dominions in general, but chiefly because he offered a rare combination of statesman and soldier which recalled the personality of his great compatriot, William of Orange.

*Economic Assistance to the Allies.*—Apart from the campaigns against German Southwest and East Africa, which involved the

<sup>1</sup> The most substantial of the grievances removed was the annual £3 poll tax, or licence paid by time-expired coolies who had remained in South Africa; and the refusal of the Courts to recognise the validity of Indian (polygamous) marriages. The effect of this latter was to prevent the children in India of locally-domiciled Indians from entering the Union under their father's status.

service of 43,000 and 67,000 men respectively, and the subsequent dispatch of over 30,000 troops to Europe the Union gave economic assistance to the Allied cause. The importance of maintaining the output of gold was recognised at once, and the highly organised mining companies rose to the occasion. At the request of the Imperial Govt. and to relieve the United Kingdom workshops, the companies themselves undertook to repair the machinery and make the spare parts required by the mines, the railways, and the local industries of the Union. The equipment of the forces which reduced German Southwest Africa was provided, almost entirely, by South Africa herself. In spite of the use of substitutes for the explosives required for military purposes, and an all-round economy of mining materials, and in spite, too, of the release of white employees for the fighting forces of the Empire and of natives for the Labour battalions in France (25,090) the output of copper was maintained, that of coal was appreciably increased, and in 1916 more gold was produced in the Transvaal (nearly £40,000,000) than in any previous year. In certain respects war conditions led to directly beneficial effects. With the diminution of merchant shipping, the Union Govt., apart from emergency measures for increasing essential food supplies and checking the rise in the cost of living, took action to remove the century-old reproach of the backwardness of Boer farming, and to effect a permanent advance in the agriculture and industries (other than mining) of the country.

#### THE POST-WAR YEARS

*Aftermath of the War.*—The Union emerged from the World War with less material loss probably than any other Dominion. Against a considerable, but not oppressive, war debt (£30,000,000 of which £21,245,000, representing a capital liability of £22,019,567, was advanced by the Imperial Govt.)<sup>1</sup> she could place the administration of Southwest Africa under the mandate of the League of Nations, and the prospect of an increase both of revenue and white population from the introduction of more scientific methods of agriculture and the establishment of new industries. Her Ministers had participated on equal terms with those of Great Britain, Canada, Australia and New Zealand in the work of the Imperial War Cabinet and the British Delegation at Versailles, and had separately signed the Peace Treaties. She had become a member of the Assembly of the League of Nations, and in common with the other self-governing Dominions had acquired the status of a nation within the British Empire. On the other hand administrative difficulties had been augmented in two respects. The relations between the Nationalists and the South African party had been embittered by the suppression of the rebellion and the almost complete identification of Botha's Ministry with the policy of the Imperial Government. Aspirations and ambitions analogous to those which in Asia impelled the peoples of India, China and Japan to challenge the superiority of the European, had been fostered among the non-European subjects of the Union by the levelling influence of World War exigencies. In particular the growth of a race consciousness among the Bantu millions emphasised the dangers inherent in the paucity of the white population and increased the urgency of a question which was engaging the attention of the Government when the outbreak of the War had caused it to be postponed—the need for a new adjustment of the relations subsisting between the European and non-European populations of the Union.

*Nationalist Agitation.*—The five years' life of the first Union Parliament had expired in 1915. The composition of the new House of Assembly, enlarged by the quinquennial redistribution from 121 to 130 seats—South African Party, 53; Unionists (formerly Progressives), 38; Nationalists, 27; Labour, 6; and Independents, 6—showed a weakening of the South African party; and, although there was no coalition, the Government had been kept in office by the support of the (mainly British) Unionist party. The extent of the dissension among the Dutch which (as related above) led to the formation of the Nationalist

party in 1913, was evidenced by Gen. Hertzog's action at the close of the War. In 1919 a congress of this party resolved to petition the Peace Conference for the independence of the Union. That the proposal was contrary to the general sentiment was shown by the repudiation of the movement by 78 to 24 votes in the Assembly. In the event, when the Nationalist deputation was received by Mr. Lloyd George in Paris (June 5 1919), Hertzog did not press the demand for the independence of the Union, but concentrated upon a claim for the restoration of the independence of the Transvaal and Orange Free State on the ground that the annexation of these Boer Republics was a violation of the right of small nations to exist. To this Lloyd George replied that the British Govt. could not intervene to re-open the settlement of 1903. "The constitution of the new Union was the free act of the whole people of South Africa representing both white races and all the Colonies." And in answer to Hertzog's contention, that so long as the issues of peace and war remained with the British Govt., the self-government of the Union was merely fictitious, he said: "The status of South Africa, as one of the Dominions of the British Commonwealth, is . . . one which enables the South African people to control their own national destiny in the fullest sense . . . and participate in Imperial policy on a basis of perfect equality."

*General Smuts becomes Prime Minister.*—Scarcely three months later Botha's great career was ended by his unexpected death, on his return from the Peace Conference, at the age of 57 (Aug. 28). He was succeeded by his intimate friend and colleague, Gen. Smuts, upon whom devolved the duty of moving the ratification of the Peace Treaty. In doing so (Sept. 8) the new Prime Minister took occasion to expound the constitutional implications of the separate ratification, emphasising the rights inherent in the national status acquired by the Union, and the work of the British Empire as a civilising agency and chief factor in the League of Nations. The fact that his speech was, and was intended to be, a formal reply to the contentions of the Nationalist party, gave point to the voting; which resulted in the motion being carried by 84 to 19 votes in the Assembly, and by 30 to 5 in the Senate.

But although Gen. Smuts was now a statesman of international standing, the loss of Botha's personal influence over the backveldt Boers became apparent in the succeeding general election (1920). In it there were returned to the Assembly (again enlarged from 130 to 134 seats): South African party, 41; Unionist, 25; Nationalist, 44; Labour, 21; and Independents, 3. This result left the Smuts Govt., even counting on the support of the Unionists, with only a slender margin of votes. And, at the same time, important measures, among which was the Native Affairs Administration Bill, postponed by the War, awaited attention. This legislation Smuts felt unable to undertake without more assured parliamentary support. Before the election he had appealed (Sept. 17 1919) to the country for unity on a basis of (1) the British connection; (2) the co-operation of the Dutch and British; and (3) industrial development.

The appeal had failed; but, in spite of this discouragement, he resolved to repeat it. The re-union (hereeniging) of the two sections of the Dutch had been mooted in 1919, and in this year (1920), after speeches by Smuts in the Free State a conference of the Nationalist and South African parties met at Bloemfontein. On all but one point agreement was reached. The Nationalists insisted upon the retention of "independence" in the (combined) party programme: the South African party refused. Smuts then (Sept. 29) appealed to the electorate on the single question which has kept the Dutch apart—secession. On this issue the Unionists were at one with the South African party, and before the end of the year, by the amalgamation of the two, the Unionist party ceased to exist. Parliament was dissolved on Dec. 31 and the general election (Feb. 8, 1921) gave the (enlarged) South African party a sufficient majority (22) over all other parties in the Assembly. The Labour representation had dropped from 21 to 13. For the time being the Union was rid of secession, and Smuts was free to attend the first post-War Imperial Conference which met in June.

<sup>1</sup> Of the amount advanced by the Imperial Govt. £11,884,000, converted into bonds with fixed rates of redemption, remained a liability of the Government of the Union in 1926.

*Strike on the Rand.*—Not long after his return an emergency arose which, for the moment, united both sections of the Dutch with the British in a common determination to uphold the authority of the Government and the existing order of society. On Dec. 9 1921, the Chamber of Mines decided that the ratio of coloured to white labour must be raised; since, if the price of gold (as seemed likely) fell to 85 s. the ounce, 24 out of the 29 producing companies would be working at a loss. This necessary economy in the cost of production led to a strike of the (white) miners on Jan. 10 1922. A collision between the strikers' organisation (which had rigidly enforced the stoppage of work) and the police on Feb. 27 developed on Monday March 6, into a revolutionary outbreak; and by the end of the week, in the Prime Minister's words, with the exception of Boksburg and the central district of Johannesburg "practically the whole of the Witwatersrand was in possession of the revolutionaries." Then the Government, which had watched and prepared, mobilised all its available forces (nearly 20,000), and on Friday (10th) martial law was proclaimed. On Saturday Smuts left Cape Town to direct in person the suppression of the strike. Leaving the railroad, he passed through the lines of strikers by car in the darkness and reached the central area of Johannesburg at midnight (March 11-12). On Tuesday the strikers surrendered and on Wednesday suppression of the strike was officially announced. The Miners' Union repudiated the disorders, and directly the fighting was over the white labourers, freed from terrorism, went back eagerly to work. This affair aggravated Communist propaganda acting upon the considerable anarchist element which had clung to Johannesburg from the time it was a mining camp and was costly in human life. The casualties of the Union forces were 61 killed and 199 wounded; those of the insurgents 138 killed and 287 wounded; and of the non-European population 31 were killed and 67 wounded.

There followed two years of comparative calm in which the high cost of living and other dislocating effects of the War were gradually surmounted. In them Gen. Smuts pursued his high aim of uniting the citizens of all parties in an endeavour to find a larger prosperity in the development of the natural resources of the Union, and in mutual goodwill. On the other hand questions of native administration were left in abeyance. Apprehension had been aroused by the census of 1921, which showed that, in addition to the great absolute increase, the non-European population of the Union was increasing relatively at a higher rate than the European. In response to the somewhat unreasonable alarm created by these figures, Gen. Hertzog let it be known that the Nationalist party were prepared to introduce changes in the system of native administration, which would erect a permanent barrier against the encroachments of the non-European races upon the industrial sphere of the whites. To the hopes thus aroused, and to an illogical resentment against Gen. Smuts over the part he played in the suppression of the disorders of 1914 and 1922, and to a certain lassitude—the natural effect of a long and exacting period of office—apparent in the work of the administrative departments must be ascribed the defeat of the South African party in 1924.

*The Nationalist Government.*—The new Assembly (135 seats), elected June 17, was composed of: Nationalists, 63; South African party, 53; Labour, 18; and one Independent. As in 1920, Labour held the balance of power, but prior to the election a "Pact" had been made between the Nationalist and Labour parties to avoid three-cornered contests and to vote for each other's candidates. The Pact was to end with the election, but when in the event the Nationalists failed to gain a majority over all other parties, it was converted into a coalition Government in which at first two, and subsequently three portfolios were assigned to Labour. The new ministry was, however, so predominantly Nationalist that there was considerable apprehension both in South Africa and in England as to what might happen if the demand for independence, with all its implications, were maintained. In particular it was feared that the visit of the Prince of Wales, previously arranged, might no longer be acceptable after this verdict of the polls. These apprehensions have not been justified. It is true

that the next year's budget (April 8 1925) included a reduction of the preference given since 1903 to United Kingdom goods.

But in the matter of secession, Gen. Hertzog, as Prime Minister, modified essentially the pronouncements which he had made in opposition. While, on Oct. 20 1920 he had said that "if there was a majority of even one for a Republic the others would have to give in," on April 28 1925, he told the Assembly that, while any Dominion had the right to secede, it would be for the Union "a flagrant mistake and a national disaster, should it (a secession) be brought about in circumstances causing either the English or the Dutch section as a whole to feel that the change had been caused by the imposition of the will of the one section on the other." It must be added, however, that a statement in a precisely opposite sense was issued simultaneously by the Secretary of the Transvaal Nationalist party with the approval of its leader, Mr. Tielman Roos, the Minister of Justice and Deputy Prime Minister. And these discordant utterances were repeated by Hertzog and Roos after the session had ended. Obviously this sharp division of the Nationalist party on secession would facilitate a *herein*ing between the moderate Nationalists under Hertzog and the South African party; and this, together with the loosening of party ties to be expected from the discussion of the Government's native policy, makes a re-grouping of the electorate in the near future not improbable. Two days after the Prime Minister's reassuring statement in Parliament, the Prince of Wales landed at Cape Town. So far from his visit (April 30-July 29) giving rise to any untoward incidents, it was productive of a renewed friendliness between the Dutch and British.

*Changes in Native Administration.*—In the recess (Nov. 13) Gen. Hertzog stated his native policy thus:

1. The "Coloured people" to be treated as Europeans; being released from all industrial restrictions and, except that a higher electoral qualification would be required of them than of Europeans, admitted to the parliamentary franchise;
2. The whole Native population of the Union to have direct<sup>1</sup> representation in Parliament. This representation to consist of seven additional members of the Assembly (one for the Free State, and two for each of the three remaining provinces), such members to be Europeans elected by natives only, voting in separate electoral areas;
3. Local self-government on the Glen Grey principle to be extended to all natives by the constitution of district and general councils and a Union council meeting annually; these councils to have only advisory or other limited powers;
4. Since, under the Constitution Act, natives as well as coloured people, are admitted in the Cape Province to the franchise on the same (low) qualification as Europeans, these measures would involve the disfranchisement of the natives, and the raising of the qualification for coloured people, in this province. (Such legislation can only be enacted under the Act by a two-thirds majority of the members of both Houses in joint session.)

It is understood that this political segregation of the natives is to be accompanied by an industrial and territorial segregation; and it is somewhat disconcerting that Gen. Hertzog should have omitted to deal with this aspect of the subject, since it is here that, in the opinion both of supporters and critics, the main obstacle to his proposals is to be found. The total population of the Union, 6,928,580 (according to the census of 1921), is made up of 1,519,488 whites, 545,548 "coloured people" (i.e., mixed European and other races, with the Malays of the Cape Province), 165,731 Asiatics, and 4,697,811 Native Africans. The whites are, therefore, in a minority of one to four; and the significance of the relative paucity of the European population within the Union is emphasized by the neighbourhood of the 750,000 natives living in the Territories of the High Commission. Of the natives within the Union, 1,017,448 live in the Native Territories of the Transvaal, Glen Grey and Herschel subject to the control of Union officials, on lands reserved for them from which Europeans are excluded; while the rest live in the rural areas occupied by the European population or in urban areas. It is to the 3,700,000 natives living generally, but not entirely, under European employment in these otherwise European areas, that industrial and territorial, as well as political, segregation is to be applied.

<sup>1</sup> Under the Constitution Act they are represented *indirectly* through the nominated members of the Senate.

But while all natives living in European areas are to be prohibited from pursuing avocations which afford a livelihood to Europeans, for those among them who are unwilling to accept the position of unskilled and menial workers, separate areas are to be provided. In these areas (but not outside them) it will be lawful for a native to purchase or lease land, to practise any skilled handicraft, and to pursue any trade or profession. Thus, without injury to the progress of the detribalised native in civilisation, a more rapid increase of European population would be assured by protecting the European in European areas from the competition of trained and educated natives. To accomplish this object, however, without grave injustice, with the probable sequel of insubordination, the areas to be reserved must be sufficiently extensive and fertile to provide the displaced natives with the means of existence within them. Otherwise segregation would become merely an agency for imposing conditions of life upon all non-tribal natives, which would compel them to continue to serve the Europeans upon terms definitely excluding any opportunity of rising to positions for which their skill or professional ability might qualify them. And as evidence of the difficulty of finding these self-sufficing areas, critics of the policy recall the Commission appointed to delimit such areas under the Native Land Act of 1913; and the subsequent withdrawal of the Native Affairs Administration Bill which was to have given effect to the findings of the Commission. With every desire to do justice to the claims of both parties the commissioners were able to assign only a bare 13% of the soil of the Union to the 4,500,000 natives as against 87% to the (then) 1,250,000 Europeans.

Although the four Bills embodying this policy were merely tabled in the Assembly (June 2, 1926) with a view to subsequent consideration within and without Parliament, two measures inspired by the fear of non-European encroachment upon the industrial sphere of the Europeans were dealt with in the session of 1926. The first, the Mines and Works Act, 1911 (Amendment) Bill, legalises the Transvaal Mining Colour Bar clause which (in effect) prevents any "coloured person," however competent in fact, from being deemed competent for employment in mines, factories or industries using mechanical propulsion; such legalisation having been made necessary by a judicial decision pronouncing the clause in question to be *ultra vires*. But since it also permits the Transvaal practice to be applied throughout the Union, it was opposed by the South African party and twice rejected by the Senate. In the event this "Colour Bar" Bill was passed on May 13 in a joint session of the two lower Chambers by 83 to 67 votes.

The second, the Areas Reservation (Asiatic) Bill, applies the segregation principle of the Native Land Act, 1913, to Asiatics domiciled in the Union, and would prohibit the Indians in Natal and the Transvaal from acquiring or leasing land except in specified areas. In answer to the protests of the Indian community in South Africa and the Press and Government of India, the Union Govt. made the very same proposal which, early in the century, the Crown Administration of the Transvaal in the like circumstances had made (unsuccessfully) to the Colonial Secretary; viz.: that representatives of the protesting Government should visit South Africa and study the question on the spot. As the result of the visit of the official deputation sent from India for the purpose, and of subsequent negotiations, Dr. Malan (Minister of the Interior) announced on April 23, 1926, that a conference of representatives of the two governments would be held to seek a solution of the Indian problem on the basis of a recognition of the need of safeguarding in South Africa "Western Standards of Life by just, legitimate means." He added that the Government had decided not to proceed with the Bill until the results of this conference were available.

Later in the session a Bill to provide the Union with a National flag from which the Union Jack was to be excluded aroused so much opposition among the British, that the measure was temporarily withdrawn. But, as we have seen, in 1926 the Native Question dominated the field of South African politics. And in view of the difficulties of the segregation policy as a means of increasing the European population of the Union, the success of a

recent effort to promote the same object by the settlement of British farmers must be put on record. In commemoration of the centennial anniversary of the Albany Settlement, the "1820 Memorial Settlers Association" was founded in 1920 for the purpose of introducing men and women of the right type into South Africa by judicious and soundly conducted migration and land settlement. Up to 1926 2,077 settlers and their dependents had been permanently established, with a total capital of £3,500,000. In 1925 the association was so encouraged with the success achieved that it acquired three farms and established them as training centres.<sup>1</sup> See the *Yearbook of the Union of South Africa*, annual, and the various official publications and parliamentary papers. (W. B. W.)

## II. DEFENCE

The establishment of the Union in South Africa in 1910 involved a fusion of the different military systems then obtaining in the four colonies which became original constituent provinces of the Union. The Cape Colony and Natal, and that part of the Transvaal (chiefly the Witwatersrand) with a large British population, maintained volunteer forces which differed only slightly, if at all, in their essential features from the old volunteer force of Great Britain. In each of the three colonies there was also a cadet organisation. In the greater part of the Transvaal and in the Orange River Colony, renamed in the Union the Orange Free State, the Burghers, organised on the lines of the old republican forces, constituted the military forces of the State. In all the colonies the liability of every able-bodied male to be called upon to render military service to the State in time of peril was accepted and recorded in the law. A small permanent force was kept in the Cape Colony, and on even a smaller scale (being confined to staff) in Natal and the Transvaal.

On June 14 1912 the South Africa Defence Act 1912 became law, and in that Act were reaffirmed the general principles which characterised the different colonial military systems. The Act provided for a permanent force, divided into Staff and Mounted Rifles, of which latter there were five regiments. The South Africa Defence Amendment Act 1922, an amending Act framed in the light of experience gained in the World War, effected radical changes in the composition of the permanent force, which was so altered as to provide a nucleus of trained and permanently serving units of every arm essential to a modern army and capable of combining with the bulk of the military force of the State, the Citizen Force. The permanent force now consists of the South African staff corps, instructional corps, naval service, field artillery, mounted riflemen (one regiment), garrison artillery, engineers, air force, service, medical, ordnance and veterinary corps and an administrative, pay and clerical corps. In other respects the Act of 1912 practically stands.

Every citizen of the Union between the ages of 17 and 60 (both included) is liable to render personal service in time of war in defence of the Union in any part of South Africa, and the National Reserve is composed of all citizens so liable who do not belong to any other portion of the forces. The Citizen Force is the real military force of the State, and consists of units of the Active Citizen Force, the successor of the volunteer forces already mentioned, and of rifle associations which may be regarded as carrying on the commando system of the old republican burgher forces.

Every citizen is liable to undergo, beginning in his 21st year, four years' "peace training" in the Active Citizen Force, but may enter for the training voluntarily in any year from his 17th to his 21st year (both included). The number to be trained is placed in the Act at 50% of the total number liable, but Parliament may increase this number. A ballot is provided for in case of shortage of entries. After "peace training" has been completed the trained man goes to class "A" of the Citizen Force Reserve, where he remains until his 45th year. "Peace training" may also be performed in the Coast Garrison Force or the Royal Naval Volunteer Reserve. The latter unit may be placed at the disposal of the Royal Naval

<sup>1</sup> The importance of this effort cannot be realised without reference to the past history of South Africa. "The mere presence of the natives, in addition to furnishing a chronic source of contention between the British and the Dutch, by providing a cheap supply of manual labour blocked the way against British emigration on a large scale; since the labouring class emigrant, who was the chief means of peopling Australia and Canada, could find no market for his manual labour in South Africa. And so, by a strange irony of fate, justice to the natives deprived the British Administration of the readiest and most satisfactory agency for the solution of the nationality difficulty—a rapid introduction of a British population large enough to have converted the Dutch into an appreciable, but politically impotent, minority."—Worsfold, *Union of South Africa* (All Red Series), 1912.

authorities in time of war, and is part of the Royal Naval Reserve constituted under the Naval Forces Act 1903 (Great Britain and Ireland).

A citizen who at the age of 21 has not entered the Active Citizen Force is compelled to serve for four years in a rifle association, where he is taught the use of military weapons of precision. On completion of this service the rifle association member is transferred to class "B" of the Citizen Force Reserve, where he too remains until he reaches his 45th year. In addition to the Reserves already mentioned, provision is made for a Veteran Reserve. Cadet Service (13 to 17) is compulsory, but exemption is procurable at the request of a parent or guardian. (J. J. C.)

### III. EDUCATION

Under the Union, control of education "other than higher," a definition interpreted as all education below university standard, was left to the provincial councils, with the result that each province has a different system. They have, however, features in common. Each province provides elementary, secondary and high schools for white children and training colleges for teachers. Technical, art and other vocational schools were also provided, but in April 1925 the Union Education Department took over responsibility for vocational education. Education for white children is compulsory between the ages of seven and 15 (16 in the Cape and Free State provinces). Primary education is everywhere free; in the Transvaal secondary education is also free. Religious instruction is allowed and, in certain conditions, may be in the Cape Province of a sectarian character. The bilingual difficulty, acute at first in the Orange Free State, has been overcome in all the provinces by the use of the home-language, English or Dutch, as the medium of instruction in the lower standards. The Dutch taught is Afrikaans, not Netherlands Dutch. The education given is in general sound, and the provincial councils have adopted ingenious methods for securing instruction for the white children scattered in small numbers in remote areas. For non-Europeans the facilities afforded for schooling varied considerably, but tended to increase, notably in the Cape Province. The education of natives is largely in the hands of religious bodies who in the Cape also maintain training schools for native and coloured teachers. State expenditure on education in the four provinces combined rose from £1,500,000 in 1910 to £6,400,000 in 1922, when 331,000 European and 251,000 non-European children were attending school. About one-twelfth of State expenditure was for non-European schools. In 1924 the Union Parliament made provision for a uniform scale of salaries for teachers.

*University Education.*—When the Union was established the only university in South Africa was that of the Cape of Good Hope, an examining body with affiliated colleges, of which the oldest and best known was the South African College at Cape Town. The demand for greater facilities was insistent, while rival claims provoked much heated controversy. A solution was found in 1916 in the passing of an Act to establish three universities, namely, the University of South Africa, the University of Cape Town and the University of Stellenbosch. The University of South Africa, which was formally established in April 1918, is the legal successor of the University of the Cape of Good Hope. Its headquarters are at Pretoria, and it at first embraced the following constituent colleges: Grey (Bloemfontein), Huguenot (Wellington), Natal (Pietermaritzburg and, for certain subjects, Durban), Rhodes (Grahamstown) University (Potchefstroom), Transvaal (Pretoria) and the South Africa School of Mines and Technology (Johannesburg). The University of Cape Town was formed by the incorporation in 1916 of the South African College, and under the act of incorporation new buildings for the university were to be erected on the Rhodes estate above Groote Schuur, probably the most beautiful site for a university in the world.

The building began in 1922, in which year the S.A. College of Music was amalgamated with Cape Town University. Besides the usual facilities, the university has a school of African life and languages. A large hospital close to the Groote Schuur buildings will serve as a clinic for the medical school. Stellenbosch University, created in 1918 by the incorporation of the Victoria College of that town, is attended very largely by Dutch-speaking

students. Its special features are its agricultural and theological faculties. The desire of the Rand for a separate university led in 1922 to the incorporation of University College, Johannesburg, (as the school of mines and technology had been renamed) as the university of the Witwatersrand. It has all the usual faculties, but is specially noted for original work in metallurgy, geology and allied sciences. The joint matriculation board and the joint committee for professional examinations are bodies representative of all the universities.

The Union maintains five agricultural schools and experimental farms, and in connection with them awards scholarships and provides for laboratory research. There is an institute for medical research at Johannesburg, to which is attached the miners' phthisis medical bureau. There is, further, a research grant board. The South African public library, Cape Town, is a national institution. It has over 140,000 volumes, contains the Grey and other valuable collections and is the largest and oldest library in the Union, having been founded in 1818.

Several large sums were given or bequeathed by private citizens for university purposes—mostly for capital expenditure. State outgoings on higher education rose from £104,000 in 1912 to £253,000 in 1923. In the same period the number of university students increased from 1,285 to 4,166. (See *The Official Year Book of the Union of S.A., Reports of the Education Administration Commission, 1923 and 1924*; also the *Reports of the Phelps-Stokes Commissions on African education*, published in New York.) (F. R. C.)

### IV. ECONOMIC HISTORY

*General Conditions.*—In the decision to establish the Union the advantages to be derived from a single authority to control financial, commercial and other economic relations played an important part. Unity assured internal free trade and a common tariff for external trade. Special customs agreements regulated the relations of the Union with neighbouring British possessions (Rhodesia and the native protectorates), while South-West Africa, on coming under Union mandate, was included in the free trade area. The Union Govt. assumed responsibility for the Transvaal-Mozambique convention of 1909, which provided for free trade in the products of the soil of Mozambique and the Transvaal, for the recruitment of natives of Portuguese territory for the Rand mines, and for the regulation of trade with Lourenço Marques, the one port in foreign possession serving the Union (see LOURENÇO MARQUES).

The provinces retained their administrative identity, but had no power of taxation or other means of raising revenues except such as were given them by the Union Parliament. The Financial Relations Act of 1913 specified these powers and provided for a subsidy from Union funds of one-half of the ordinary annual expenditure of the provinces. The Baxter Commission on Provincial Finances in 1923 recommended the termination of this arrangement, and in 1925 the £ for £ subsidy was replaced by a *per caput* grant for education and a new scheme of provincial taxation, calculated to lessen provincial autonomy.

The Act of Union placed harbours and railways—nearly all State owned—under the control of a single Ministry, with the provision that they were to be worked on strictly business lines. Among the first measures taken by the Ministry were extensions to assist trade and especially agriculture by building branch lines and by improving port facilities. As large areas of the country are subject to droughts and irregular and, at times, excessive rainfall, farming has not the stable conditions which prevail in most countries; hence the greater need for scientific methods and for aid to the farmers. A Union Land Bank was established in 1912 which gave liberal advances to the farmers and pastoralists. By this means, by its agricultural colleges, and in other ways the Union Govt. did much to increase efficiency. Large irrigation works were also carried through, costing between 1910 and 1926, over £12,000,000 in capital expenditure.

While the permanent well-being of South Africa depends probably upon agriculture, the mining industry occupies a unique position. South Africa is the chief source of the world's supply of

diamonds, and produces half the world's gold output. In no other country does so large a proportion of the people depend for a livelihood upon gold mining, which from its essential nature is a wasting asset. Other branches of mining, however, may be expected to develop as gold mining declines. Coal is of great actual, and greater potential, importance. It is mainly due to the existence of cheap coal that the large output of gold and diamonds has been made possible. In addition, considerable quantities are used for ships' bunkers and there is a growing export.

All economic developments in South Africa are conditioned by a labour situation which is unique. The direction and organisation of all important industries is in the hands of Europeans; but the great bulk of the labour is supplied by natives, Asiatics, and other non-Europeans. In the Cape province the "coloured" people; while they engage in semi-skilled and skilled labour, supply the great bulk of the unskilled labour force; the sugar plantations in Natal are worked mainly by natives; though some Indians are still employed; the mines are entirely dependent upon an adequate supply of native labour. Throughout the Union farmers depend almost entirely on natives (or, in the western province, coloured workers) for manual labour. Thus the European has been restricted almost entirely to the work of supervision and the skilled crafts; and white workers who fall out of these classes, especially white men and their families who lose their footing on the land in some period of agricultural distress, have a difficulty in finding employment, and constitute the intractable "poor white" problem.

#### THE PRE-WAR SITUATION

*Trade.*—The first five years, 1910-4, of the Union were marked by steady progress. Both agriculture and mining were in a healthy condition. There was little unemployment, and industrial unrest was confined to the Rand. The average annual imports were £37,935,000, average annual exports £56,022,000. The excess of exports was a constant feature, representing interest on British and foreign capital invested in South Africa. The whole of the gold output was shipped to London, where all foreign trade accounts were adjusted. Some 66% of the imports were supplied by Great Britain, which took 88% of the exports. Of British dominions there was a considerable trade with India and Australia, while foreign countries, headed by Germany and the United States, supplied 29% of the imports, but took little over 6% of the exports. The imports were of a very general nature; the chief exports were gold, diamonds, coal, wool and sheepskins, mohair, maize and ostrich feathers. The value of the gold output had increased from £31,900,000 in 1910 to £35,600,000 in 1914; diamonds exported reached their highest value, just over £12,000,000, in 1913. At this period, considerably more than half the capital in these industries was still held by investors dwelling abroad.

*Production.*—Of at least equal importance to the well-being of the people are the industries in which the capital is South African. Of these, the chief is the breeding of woolled sheep with the subsidiary but valuable trade in sheepskins. In 1913 there were over 28,000,000 woolled sheep in the Union, mostly in the Cape and Orange Free State. The mohair industry continued to flourish in this period, but the Angora goat is more dependent on good seasons than is the sheep; severe droughts were mainly responsible for the decrease in the number of Angora goats from 4,395,000 in 1912 to 2,844,000 in 1916. Ostrich farming, almost confined to the Cape province, attained its highest degree of success in 1913, when 1,023,000 lb. of feathers, valued at £2,953,000, were exported. Subsequently the War and the change of fashion made the trade very uncertain; and the tendency has been to substitute dairy or other forms of farming for ostriches.

Of cereals, only maize was grown for export. This export trade had started in 1904; by 1914 it was firmly established and had begun to occupy the position in farming in the Union that wheat occupies in Canadian and Australian farming. But the uncertainty of the seasons renders maize a very unequal crop, abundance one year being followed by dearth in the next. Next to maize,

oats and wheat are the chief cereals; with the aid of a protective tariff, enough is usually grown to supply most of the home requirements. Owing to the sparse population and, in large areas, to the defective quality of the soil, the cultivated area is still small—in 1921 only 13,000,000 ac. out of a total farm area of 261,000,000 acres. With better means for the prevention and control of stock diseases cattle breeding had become more profitable; in 1914 the export of beef for the first time reached notable figures. Dairying, too, had ceased to be regarded as a "side line" by farmers, and in 1914 five-sevenths of the butter consumed in the Union was home produce.

Of other products, tobacco, grown mostly in the Transvaal, was developed and became better known. Sugar production in Natal and Zululand largely increased and tea maintained its position. Besides supplying the bulk of the protected home market there was beginning to be a surplus of sugar for export. The Union Govt. from its establishment made efforts to promote cotton cultivation, but in 1914 the industry, though promising, was still in its infancy. Attention was also paid to better means of dealing with fresh fruit for export. It may be added here that in 1922 the Union Govt. denounced the Mozambique convention, which lapsed in 1923. Thereafter the imposition of a tariff on Mozambique sugar gave additional protection to Natal sugar.

*Industry.*—Manufacturing industries were encouraged by the Union legislation; but the chief development was in factories engaged in the preparation of food and drink for the local market and in the production of heat, light and power (specially for the Rand mines). While manufactures were still on a comparatively small scale, the value of the gross output was estimated at over £17,000,000 in 1911, when 21,000 Europeans and 44,000 non-Europeans were returned as engaged in factories.

#### THE WAR PERIOD

The World War had, in South Africa as elsewhere, a marked effect on economic conditions. Some industries, such as gold mining, sheep farming, beef production and manufactures, it stimulated; others, such as the trade in diamonds and ostrich feathers, it depressed. The general rise in the prices of commodities in 1916 and following years render comparisons in terms of sterling of limited value; the rise in the average annual value of imports in the five years by less than £4,500,000 shows a restriction of imports, while the rise of £27,000,000 in the average value of exports reflected higher prices rather than increased production. As an example, in 1915, before prices had begun to soar, the 170,000,000 lb. of wool exported fetched £5,380,000; in 1919 the 184,937,000 lb. of wool exported fetched £17,919,000.

*Trade.*—The direction of trade in the War period showed important changes. British manufacturers, engaged intensively in meeting War demands and in supplying goods previously obtained from Germany, lost ground in South Africa, and German trade ceased. The United States and Japanese trade in consequence gained; they also became large purchasers of South African goods.

*Gold.*—To the general rule of increased prices there was one exception; throughout the War the system by which all the gold produced in South Africa was pledged to the Bank of England at a fixed sale value (a little under 85s. an ounce) was maintained. But the cost of production had risen some 25%, and this, together with a stationary price for the metal and the low grade of ore in many mines, threatened a crisis. Some mines ceased working and the closing of about 20 more mines was contemplated. But the continued and instant demand for more gold from all countries had its effect; when war ended, the arrangement for a fixed sale price was terminated, and from July 1919 gold fetched its market value. This so-called "premium on gold," the additional price it fetched in sterling, not only saved the low-grade mines, but had an important effect on industry in general. Gold reached its highest price, 130s. an ounce, in Feb. 1920. From this point deflation began, and as sterling approached parity with the United States dollar the premium decreased and finally disappeared with the resumption of the gold standard after May 18 1925.

## THE RETURN TO NORMAL CONDITIONS

The year 1919 had been a disappointing year to the general community in South Africa. The inability of British traders at once to supply the goods required for re-equipping works was noticeable. Merchants in the Union who had heavy stocks realised very high prices. There was a brief spurt in the ostrich feather trade and a recovery in the diamond trade, but general conditions were unfavourable and agriculture and pastoral pursuits suffered from severe drought, followed early in 1920 by excessive rains—which cause almost as much damage as drought. The year was marked by much industrial unrest, which would have been much worse but for the increased price obtained for gold in the latter half of the year.

If 1919 had proved a difficult year 1920 was even more abnormal. It began with a great and unhealthy boom in trade and ended in depression. For the first time imports exceeded exports in realised prices, the figures being, imports £105,927,000, exports £98,997,000; of the imports over £75,000,000 was spent on manufactured articles and £10,600,000 on raw materials and articles used in agriculture. Of the exports over £64,000,000 represented the products of mines, while £25,600,000 represented the sale of agricultural and pastoral produce. The sums realised by exports rarely indicated increased production. Much of the trade was speculative, and with the collapse of the "boom" a period of financial stringency followed. This condition continued throughout 1921. Owing to the premium the gold industry was least affected. The output had been decreasing since 1916, when the gold exported was valued at £38,100,000, but in 1920 the effect of the premium was that £42,273,000 was realised for a smaller output; in 1921 the gold fetched £41,191,000. Other industries were severely hit. The diamond and ostrich feather trade collapsed, and while the maize crop exported exceeded all previous amounts and there was a large increase in the exports of wool and mohair, most commodities, including wool, had to be sold for little more than half the prices realised in 1920. There was indeed much difficulty in selling the wool and mohair at all; eventually the British Govt. bought the unsold portion of the wool crop at about 1914 prices.

The period of deflation was painful but inevitable. It was hastened, and the consequent suffering rendered much more acute, by the disturbances which stopped gold-mining on the Rand, an account of which is given above in the first three months of 1922. The gold industry was put on a paying basis again, with benefit to the whole country. Working costs, which had reached 25s.8d. per ton milled in 1920, had fallen by 1924 to 19s.7d.

*Railways.*—Apart from the Rand disturbances, 1922 was a year of reconstruction. This was seen, for instance, in the scheme for railway extension and harbour improvements sanctioned by the Union Parliament in July 1922, in which year the railways of South-West Africa were incorporated in the Union system. The two systems had been joined physically in 1915 by the building of a railway (primarily for military purposes) from Prieska to Kalkfontein. Between 1910 and 1916 over 2,000 m. of new railways had been built in the Union. Construction had then practically stopped, but in 1922 the building of 853 m. of new lines at an estimated cost of over £4,000,000 was sanctioned. There were 23 separate schemes, mostly agricultural railways—the shortest but 2 m., the longest 71 miles. Two of these lines (in the Transvaal) were built with "poor white" labour instead of by natives. In 1922 also power was taken for the electrification of railways—the first section to be electrified was the Natal main line from Maritzburg to Glencoe.

*Harbours.*—Harbour improvements, hindered by the War, were again taken in hand, the expert services of Sir George Buchanan being engaged to examine the existing harbour facilities and to suggest future developments. The Union Castle mail service to and from England was regularly maintained, while there were direct services to India, Australia and America. The number and tonnage of ships entering Union harbours was almost the same in 1913 and 1923—4,106 vessels of 12,205,000 tonnage in 1913 and 4,377 vessels of 12,092,000 tonnage in 1923. Over 75% of the shipping is British.

*Recovery in Production.*—Notwithstanding the loss occasioned by the Rand disturbances and a bad maize season, the year 1922 closed with more hopeful prospects and 1923 is regarded as representing the return to normal. The gold export, which, owing to the strike, had fallen to £30,000,000 in 1922, rose to over £39,000,000; and in maize the exports reached 1,128 million lb. (a higher total than previously recorded) and realised over £3,000,000. There was also a record export of coal. Excluding gold, the volume of exports was equal to the pre-War average, but at an average increased price of 65%; the volume of imports was about 15% less than before the War, at an average increased price of 85%. Normal conditions in South Africa include, unfortunately, drought, excessive rain and locust plagues; 1924 experienced a partial failure of the maize crops and witnessed the most severe locust plague known. It was, however, a good wool and mohair season, and the general trade figures for 1924—imports £65,800,000, exports £78,000,000 reflected a real advance.

There had been a considerable after-the-war expansion of business by the Union with Rhodesia and Kenya Colony; in other respects the direction of trade from 1922 had reverted to pre-War channels. The United Kingdom largely recovered its losses, taking some 70% of the exports and supplying about 55% of the imports. Germany again became the Union's best foreign customer, the United States falling to second place. The year 1924 saw the first substantial results of the careful nursing of the cotton industry in Natal and the Transvaal, some 3,300,000 lb. of cotton being exported. In 1924, too, a platinum reef was discovered in the Lydenburg district of the Transvaal, which gave promise of becoming the world's chief source of platinum supply, though the production stage had not been reached up to 1926. The year 1925 was marked by another record maize crop, the maize exported realising £6,000,000. It was also noted for the highest output of gold from the Transvaal mines—9,599,702 oz.; and for an interruption of exports by a strike of British seamen in the month of September. The increased volume of manufactures, due to natural growth of population and the War-time restriction of imports, has been well maintained in the post-War period. At the same time, agriculture has become more intensive, the development of fruit and citrus farming, both in volume and quantity, being especially marked.

*Finance.*—Among the financial measures taken by the Union in the period of reconstruction was the establishment of a branch of the Royal Mint at Pretoria, which began operations on Jan. 1 1923. At the same time, the gold mining industry established co-operatively a refinery at Germiston. Meanwhile, an Act passed in 1920 had established the South African Reserve Bank to co-ordinate credit facilities and exercise the exclusive right to issue bank notes. Specie had thus no longer to be imported—in fact, in 1925 Pretoria was exporting gold coins to India—and when exchange rates on London were unfavourable the mines found it more profitable to sell gold to the South African Reserve Bank than to export it. The embargo on the export of specie, which had been imposed in 1914 as a War measure, was removed at the end of June 1922, at which date also the right of private banks to issue notes ceased. In 1926 the National Bank, one of the two most important private banks, was amalgamated with Barclays Bank (Dominion, Colonial and Overseas).

*Labour.*—Inquiries into industrial conditions, especially following the Rand disturbances of 1922, had led to renewed interest in conciliation machinery for disputes between employers and employed, and a Conciliation Act destined to encourage collective bargaining was passed in 1924. In 1925 a Wage Act was passed setting up a permanent Wage Board to fix legal minimum wages in trades where wages were low and to impose binding decisions in other trades when voluntary negotiations had failed to effect a settlement of a dispute. As a preliminary for the new Wage Board's activities, an Economic and Wage Commission was appointed to investigate conditions, the chairman of which was Mr. Stephen Mills, C.M.G., an Australian civil servant and Prof. Henry Clay, an English economist, one of the members.

The commission's report, issued in March 1926, contained an extensive survey of South African economic conditions. The

two overseas members and one of the local representatives condemned as unnecessary and impracticable the policy of attempting to substitute white for native labour in unskilled employment and reported against any restriction of the native's economic opportunities. The majority recommended that the Wage Board should concentrate its efforts on the lower-wage and unorganised occupations. They held that if regulations were applied to force higher the rates of the more highly paid workers those of unskilled workers were likely to be still further depressed. The leading recommendation in the minority report urged the Government to stop the importation of native labourers. The Government had already refused to allow any increase in the importation of the only native labour which counted, namely, that of Africans from Mozambique for work in the Transvaal mines. It may be added that the overseas members of the Commission came away convinced that the economic condition of the country was very healthy and much impressed by the agricultural development.

**Public Finance.**—The economic burdens of Government and the taxable resources of the country had been unevenly distributed while the four colonies retained their autonomy. The Union effected a great improvement, and the new Government found its financial task relatively easy. In the first full year, Customs brought in £4,500,000, mining revenue over £2,000,000, the railways paid interest and sinking fund as their debt and in addition made a contribution of over £1,000,000 to the general revenue. In the first five years the average total expenditure of the Union and provinces was £16,322,427 and revenue £16,975,507. The War led to a great increase. Expenditure reached its maximum in 1921-2 at £34,228,307, revenue a year earlier at £33,272,952. The net Public Debt of the Union increased from £119,366,000 in 1914 to £106,843,000 in 1924; a large part of the increase was due, however, not to War expenses, but to public works (the increase after 1918 being £45,000,000), and of the total two-thirds may be regarded as productive. Provincial expenditure grew in even greater proportion, from an average figure of £3,205,000 in the first years of the Union to £8,819,000 in 1921-2. The increased expense of the Government was met by a general increase in taxation and by the introduction of a graduated income tax in 1914, which yielded nearly £7,000,000 in 1921-2.

The collapse of trade in 1920 and the following years led to a succession of deficits, which in turn led to a check to the growth of expenditure. In the railway administration in particular drastic economies were effected, which reduced working expenditure by over £3,000,000 between 1920-1 and 1922-3, and, with the revival of traffic in 1924, converted a heavy deficit into a surplus. Until 1925 the Customs tariff, though productive in its effect, had been designed primarily to raise revenue. The Government that came into power in 1924, on the advice of a reconstituted Board of Trade and Industries, revised it in such a way as definitely to make it protective, and at the same time included provisions for extending, raising or withdrawing a duty by administrative action with a view to encouraging a new industry or checking an unsatisfactory industry. The general preference on British goods was removed and a limited list of items substituted. The United Kingdom was also promised "most favoured nation" conditions.

**BIBLIOGRAPHY.**—*The Official Year Book of the Union of South Africa*, published by the office of the Census (No. 7, 1925, 5s.), contains a remarkably comprehensive account of every aspect of economic life with full bibliographies; *The South and East African Year Book and Guide* (Union Castle Steamship Co. Ltd., 5s.) contains useful chapters in less detail. Among official reports the most useful are *Report of the Economic Commission* (1914); *Low Grade Mines Commission* (1919); *Drought Commission* (1922); and *Economic and Wage Commission* (1926). The British Department of Overseas Trade publishes periodical reports on South Africa. R. A. Lehfeldt's *National Resources of South Africa* is the most valuable brief survey of the country in its economic aspects. (F. R. C.; H. Cl.)\*

**SOUTH AFRICAN LITERATURE: AFRIKAANS.**—The rapid rise of the South African form of Dutch, known as Afrikaans, as a literary and official language has forced Dutch (Nederlands) into the background; and since 1910 there has been singularly little literary activity in the older form of the language. In the prose anthology of Koekstra and Viljoen (*Zuidafrikaanse*

*Prozabundel*) about a dozen well-known South African writers in Dutch are represented; but the popular form of the language, spoken throughout the Union, has now practically captured the literary field, and has in a comparatively short time produced more than 50 writers, some of them of outstanding merit.

As with all young languages, Afrikaans began its literary life with poetry. J. F. Celliers, who in 1906 had been a pioneer with his *Die Vlakte*, has produced *Die Rivier*, *Unie Kantate*, *Die Saaier* (1923), *Liefdelewe* (1924), *Topie Tounie*, *en ander nuwe Gedigte* (1920), and *Marjje* (1912), besides a few prose works. J. D. du Toit (Totius), who was the second in the field in 1908 with *By die Monument*, has since published *Potgieters Trek*, *Wilgerboom-Bogies*, *Rachel and Trekkerswee*. C. L. Leipoldt has followed up *Oom Gert Vertel* of 1911 by *Dingaansdag*, *Uit Drie Werelddele* and *Die Heks*, a tragedy. Celliers and Totius may be regarded as typifying the conservative element in Afrikaans literature; they are largely subjective and introspective, essentially patriotic, and intensely religious, with a rigid Calvinistic bias that colours their idealism. In local colouring and in lyrical expression the poems of Leipoldt seem more native than those of his contemporaries. D. F. Malherbe has written *Karoo Blommetjies* (1909), *Vergeet Nie, Klokgrassies*, and *Vir Vrijheid* (1919); while H. H. Joubert has published *Verse oor Piet Retief*, *Dageraad en Sonneskyn en andere gedigte* (1918). These two, with A. D. Keet (*Gedigte*), A. G. Visser (*Gedigte* 1925), and possibly F. van den Heever, are poets whose output and technical capability ensure them a place in the catalogue of Afrikaans writers. The number of minor poets is large and growing. Of the older generation, in purely humorous verse the work of Melt Brink and of F. W. Reitz must be cited.

In prose the productions of permanent merit are not numerous. Afrikaans has not yet evolved a prose style comparable with Dutch prose. C. J. Langenhoven has written on a great variety of subjects in prose and in rhymed and unrhymed verse, and his works have attained a measure of popularity. Probably his best books are *Die Lig van Verre Dae* and *Ons Weg deur die Wereld* (1919), a volume of didactic essays.

In biography F. S. Malan's *Mevrou Koopman de Wet*, J. D. Kestell's *Christiaan de Wet* (1920) and G. Preller's *Piet Retief* are the only works that can lay claim to consideration.

In fiction Afrikaans has been less fortunate. Its novels show little originality, and some of them make an appeal chiefly because of their intense national sympathy. Stories with decided literary merit are Sadie Bosman's *Onder Bevoorrregte Mense* (1925) and *Langs Kronkelende Wegen* (1916); Leon Maré's *Die Nuwejaarsfees* (1919); E. Marais' *Margriet van Laastelust* (1922); R. J. van Reenen's *Die Lokaas*; J. van Bruggen's *Teleurgestel* (1918) and *Mit Anysie* (1923); J. Lub's *Oom Frikkie* (1918) and N. Hofmeyr's *Fanie* (1925). Good work has been done in natural history by A. A. Pienaar (Sangiro), whose *Oerwoud en Vlakte* has been translated into English and German; in native, especially Bushman, sociology by G. R. von Wielligh; and in the study of language by S. P. Boshoff and D. B. Bosman. Some 25 dramas have been published in Afrikaans; of those that deal with specific South African subjects or situations none has sufficient artistic or literary merit to attract an audience that has outgrown early Victorianism on the stage.

**SOUTH AFRICAN LITERATURE: ENGLISH.**—The great poetical activity of the years 1910-26 in England had its parallel in South Africa. A recent anthology, *The Centenary Book of South African Verse* (1925), edited by Francis Cary Slater, contains poems by 68 writers, most of whom were still living in 1926. Mr. Slater's own poetry is saturated with the feeling of the country to which he belongs. His later works include *Settlers and Sunbirds* (1919), and *The Karroo, and other Poems* (1924). Arthur Shearly Cripps, a missionary in Mashonaland, wrote poetry in which the influence of Oxford is blended in a surprisingly beautiful way with that of the country of his adoption. *Pilgrimage of Grace* (1912) and *Lake and War* (1917) are two of his later volumes. He also wrote stories of life in those remote parts, including *Faersyls Forlorn* (1910) and *Cinderella in the South* (1918). Cullen Gouldsbury, for several years a native commissioner in

Rhodesia, showed poetical gifts of a high order in his *Songs out of Exile* (1912) and *From the Outposts* (1914). Mary Rosalie Boyd, in her poem *The Veld*, which won the Capetown Bardic Chair in 1921, has finely expressed the fascination exercised by South Africa upon those who come to make it their home. Charles Murray, for many years chief of the Union Govt. public works dept., has written poetry mainly in a Scots dialect. *A Sough o' War* (1917) and *In the Country Places* (1920) are his latest volumes. *The Flaming Terrapin* (1924), by Roy Campbell, one of the youngest of South Africa's poets, is a somewhat chaotic work, containing, nevertheless, passages of remarkable force and beauty.

Of the fiction produced in South Africa some few works reached a high level. *Margaret Harding* (1911), by Perceval Gibbon, and *God's Step-Children* (1924), by Sarah Gertrude Millin, deal with the difficult problems arising out of the contact of the white races with the black. Pauline Smith, a young writer born in the district of Oudtshoorn, published some short stories under the title of *The Little Karroo* (1925) marked by a fine sympathy and sincerity. Among many other writers of South African stories may be mentioned Gertrude Page, Ethelreda Lewis, F. Horace Rose, and William Westrup.

Some valuable work was done in history and biography. Sir George Cory's *Rise of South Africa* (1910, etc.) deals mainly with the development of the eastern part of Cape Colony, and gives the results of many years of patient research. Another work of outstanding importance is *Lord de Villiers and His Times* (1925), by Eric A. Walker, professor of history in the University of Capetown. An extensive literature has gathered round the name of Cecil John Rhodes, including lives by Sir Lewis Michell and Sir Thomas Fuller. Ian Colvin's *Life of Jameson* (1922); Earl Buxton's *General Botha* (1924); and Dorothea Fairbridge's *Lady Anne Barnard at the Cape of Good Hope* (1924) are also of importance. Frederick Charles Kolbe (Monsignor Kolbe), a poet and critic of distinction, also wrote a delightful autobiography entitled *Up the Slopes of Mount Zion* (1924). *Education in South Africa 1652 to 1922*, by Ernst G. Malherbe, is a useful survey of an important subject. Among many works dealing with the difficult and complex problems involved in the relations between the Europeans and the natives may be mentioned *Black and White in South East Africa* (1911) by Maurice Smethurst Evans; *The Education of the South African Native* (1917) by C. T. Loram; and *The History of Native Policy in South Africa from 1830 to the Present Day* (1924) by Edgar H. Brookes. The views of the natives themselves have found expression in *The Black Problem*, by D. D. Tengo Jabavu, and in other works. *A History of Christian Missions in South Africa* (1911) and *Thrice through the Dark Continent* (a record of missionary travel), by Prof. J. du Plessis (1917), deal with another aspect of the same subject. (H. C. N.)

**SOUTHAMPTON**, England (see 25.491), has included South Stoneham, part of North Stoneham, Swaythling, Bitterne, Sholing, Itchen and Woolston, and Weston and Newtown within its boundaries since 1920, and has now an area of 9,192 ac. (exclusive of tidal water and foreshore); the population was 160,994 in 1921. In 1912, seven civil parishes were united as the civil parish of Southampton; the area of the parliamentary borough, which includes Itchen and returns two members, is 8,032 acres. Woolston, with large shipbuilding and engineering works, is growing rapidly. A museum was opened in 1912, a Roman Catholic church in Portswood road in 1910, a large sailors' home in Oxford street in 1910, Hollybrook cemetery in 1913 and new offices for the harbour board in 1925. The corporation have acquired Tudor house, a fine old mansion, and proposed in 1925 to erect a town hall in West Marlands. A memorial to the Pilgrim Fathers, a column surmounted by a cupola, was unveiled on the west quay in 1913, a memorial of the wreck of the Titanic in the East Park in 1914 and a War memorial, 150 ft. high, in the West Park in 1920. Southampton University college removed to new buildings at Highfield in 1914. During the War they were used as a military hospital, and were not reoccupied by the college till 1919. Lord Swaythling pre-

sented South Stoneham house, in grounds of 110 ac., as a university college hostel.

**The Port.**—There has been a great increase in both goods and passenger traffic through the port of Southampton, which is now a port of call for the P. and O. Far Eastern service and the chief Transatlantic lines. Recent improvements in the harbour include the extension of the quays in the Itchen and the Test to 4,132 ft. and 4,420 ft. respectively, to provide better accommodation for liners; the enlargement and deepening of the turning area off the Ocean dock; and the widening of the Old Extension quay. In 1925 powers were obtained to reclaim about 460 ac. in the Test between the town pier and Southampton West railway station for the construction of docks and five jetties, each 1,000 ft. long and 260 ft. wide, with 45 ft. of water alongside at low tide, and a deepwater channel, 600 ft. wide, to give access to them. Two of these jetties are to be taken in hand first, and will add four deepwater berths to the five which the port possesses. Part of the reclaimed land will be utilised for industrial establishments. The West station has been rebuilt, and the line to Milbrook is to be altered to give further traffic facilities. It is proposed to dredge the harbour to provide a minimum depth of 35 ft. between the docks and Farley. A floating dock, with a lifting capacity of 60,000 tons, was finished in 1924. Southampton has an air service which operates from Woolston aerodrome to the Channel Islands. The harbour was taken over by the naval and military authorities on the outbreak of the World War. A train ferry to Dieppe, which conveyed great quantities of heavy guns, tanks, etc., was opened in 1917.

**SOUTH AUSTRALIA** (see 25.492), a state of the Australian Commonwealth. Its area is 380,070 sq. miles. The population in 1925 was 543,122. Adelaide, the capital, is a well-planned town with a population, at Dec. 31 1924, of 289,914. Other towns of importance are Port Adelaide, the principal overseas port, and Port Pirie, the port for the Broken Hill mines and the centre of the Broken Hill smelting industry. On Jan. 1 1911, the Northern Territory, which had from 1863 been incorporated in the state of South Australia, was transferred to the Commonwealth. South Australia was the first State to enfranchise women (Constitution Amendment Act, 1894), and much of the "social reform" legislation in Australia originated there.

**Production and Industry.**—A large portion of the state lies within the "dry belt," where wheat growing has been found to be possible with a low average rainfall. The area under wheat in 1911 was 2,104,719 ac., and in 1925, 2,499,852 ac., with a yield of 30,528,625 bushels. South Australia is the principal wine producing state in the Commonwealth, and great progress has been made in this industry as the result of irrigation along the valley of the Murray river. The area under vines in 1911 was 22,952 acres. In 1924 it was 49,303 ac., and the production 10,756,538 gallons. The dried-fruit industry has also made considerable progress in the irrigation areas, where large numbers of ex-soldiers were settled after the War. In 1924, 125,000 cwt. of raisins and 131,000 cwt. of currants were produced, as against 58,503 and 80,400 cwt. respectively in 1920.

Extensive deposits of iron ore exist: the reserves of ore in the Iron Knob and Iron Monarch deposits are estimated at 133,000,000 tons, with an average content of 63 to 64% iron. The Broken Hill Co. utilises ore from these deposits at its iron works in Newcastle, New South Wales. In 1921, 506,993 tons were raised. Large quantities of salt are obtained from the shallow salt lakes, chiefly on Yorke Peninsula. Over 50,000 tons of crude salt, valued at £113,000, were produced in 1923. Lake Hart, 60 sq. m. in area, situated about 120 m. northwest from Port Augusta, contains immense supplies of salt of good quality, but owing to distance from market it has no economic value. The total value of the output of factories in 1924 was £29,650,995. Metal works and machinery accounted for £8,919,965 and food and drink £7,116,910 (see AUSTRALIA).

**SOUTH CAROLINA** (see 25.499), a State of the United States of America. The population in 1920 was 1,683,724, an increase of 11.1% in the decade, as compared with 13.1% and 16.4% in the two preceding decades. The estimated population in 1925 was

1,779,084. In the decade 1910-20 the whites increased from 679,161 to 818,538, or from 44.8% of the total population to 48.6 per cent. The density in 1920 was 55.2 per square mile. The urban population was 17.5% of the whole, as compared with 14.8% in 1910. The population of Charleston in 1920 was 67,957, and the decennial increase 15.5%, the white increase being 28.3% and the negro 4 per cent. The white population, increased by war industries, was 52.4% of the whole, constituting a majority for the first time in about 200 years. The population and decennial increase for the other leading cities were as follows: Columbia, 37,524 (42.6%); Greenville, 23,127 (46.9%); Spartanburg, 22,638 (29.2%); Florence, 10,968 (55.7%); Anderson, 10,579 (9.5%); Sumter, 9,508 (17.3%).

**Manufactures.**—Textile mills paid very large dividends in 1917-20, and in addition doubled or trebled their capitalisation. Wages rose greatly, but fell 30 to 50% in the depression of 1920-1. The number of spindles in 1924 was 5,272,481; of operatives, 64,780. The bales of cotton consumed increased from 765,966 in 1908 to 1,003,375 in 1924. Cotton textiles constitute over 71% of the value of all manufactures. Timber, cotton seed oil and fertilisers are important. The capital invested in industry in 1924 was \$179,000,000, and the value of products \$217,000,000. Over half the motive power was hydroelectric; in 1920 out of an estimated potential development of 1,260,000 H.P., 450,000 H.P. had been developed. The State Board of Conciliation, created in 1916, arbitrates labour disputes on invitation, or investigates them on its own motion or by order of the governor. Women are forbidden to work in stores after 10 P.M. or over 12 hr. in one day. Children under 14 may not work in any mine or factory. No labourer may work in a textile mill more than 55 hr. a week.

**Agriculture.**—The war-time rise in prices of cotton was succeeded by a decline from about 40 cents to 10 or 11 cents a lb. in six months (1920-1). Legislation (1912) sought to stabilise agricultural prices by a system of State warehouses for holding products for a favourable market. Co-operative marketing has made considerable progress. The boll weevil became a serious menace in 1920 in the southwestern counties, from whence it soon spread over the whole state, with most serious damage in the southern and eastern sections. Under the law of 1920 extensive drainage projects were undertaken. Agricultural methods have improved and banks now finance the farmer directly at greatly lower rates than formerly charged by the "lien merchant." South Carolina led all the states in 1917 in crop values per ac. with a value of \$63. The value in 1919 was \$78.79, exceeded by three states only.

According to state government estimate, cotton covered in 1920 45% of the cultivated acreage, and represented 50% of the value of the 13 leading crops. In 1924, 831,000 bales of cotton were raised, not much over half the highest record before the advent of the boll weevil. Other crops in 1924 were: corn (maize), 21,862,000 bu., tobacco, 45,600,000 lb., oats 7,704,000 bu., sweet potatoes 6,230,000 bu., Irish potatoes 3,885,000 bushels. The figures for corn and tobacco are hardly two-thirds of the maximum. In 1920 average monthly wages for adult male farm labour without board were \$41.80. During 1910-20 the number of farms increased from 176,434 to 192,693; improved land from 6,097,999 ac. to 6,184,159 ac., average value per farm from \$2,223 to \$4,946; average value per acre from \$29.02 to \$76.70. By 1925 the number of farms had decreased to 172,766.

**Education.**—In 1919 an Act was passed making four months' school attendance each year compulsory throughout the state. Among other improvements were night schools for adults; an increased number of high schools; special teachers and inspectors in rural and textile districts; enlarged facilities for agricultural, vocational and home economics training; state standard certification of teachers; and more effective state supervision. The expenditure for common schools in the year 1923-4 was \$12,962,000, in addition to which there remained almost \$2,000,000 in hand to be expended on buildings. Enrolment in common schools in 1923-4 for whites was 238,909 and for negroes 228,516; in 1924-5, 245,619 for whites, 234,977 for negroes. In 1923-4 over

13,000 students; of whom 28% were negroes, were enrolled in the 36 colleges in the state.

The religious denominations added materially during 1910-20 to their extensive work in college education. All but 11 of the 36 institutions for higher education in the state were under church control in 1920, and these institutions contained several hundred more students than all state and other non-sectarian institutions combined.

**Social Legislation.**—In 1912 race-track gambling was forbidden. In 1913 the penitentiary hosiery mill was abolished as harmful to the health of the prisoners. The State Board of Charities and Corrections, created in 1915, was reorganised in 1920 as the board of public welfare. The State Hospital for Insane was entirely remade, materially and administratively, during 1915-9. The placing of orphan and homeless children was taken over by the state in 1920. In 1918 a reformatory institution for white girls was established, and the reformatory for negro boys was reorganised. The probate judge in each county is constituted a juvenile court. Penal and charitable institutions (including church and private charitable institutions) have been under state inspection since 1915. The age of consent was raised in 1921 to 16 years. No city had, by 1926, acted on the permission granted in 1915 to segregate whites and negroes by city blocks.

**Finance.**—The budget system, adopted in 1919, tended to economy and system. The State Tax Commission, created in 1915, improved the administration of the tax laws. The assessed taxable value of all property in 1924 was \$428,601,274, being a fourth, or perhaps less, of the market value. In 1925 the receipts were \$24,491,562; the disbursements \$22,333,208. The bonded debt was \$5,384,125.

**Political History.**—The class feeling that has so frequently been strong in South Carolina politics found violent manifestation during the governorship of Coleman L. Blease (1911-5). The Legislature was at all times controlled by his opponents and passed many measures over his veto. Resigning without giving an explanation, he was succeeded for five days by Lieut.-Gov. C. A. Smith. In 1918 Mr. Blease ran for the Senate, opposing the country's participation in the World War. He was overwhelmingly defeated, but was elected Senator in 1924. Richard I. Manning was elected governor in 1914. Gov. Manning's two administrations were marked by constructive legislation and effective co-operation with the national government. Gov. Robert A. Cooper was elected in 1918 on a platform that made education its chief plank, and announced that as a result of progressive legislation taxes would be higher. He was re-elected without opposition in 1920, but resigned in May 1922 to accept a Federal appointment, and was succeeded by Lieut.-Gov. W. G. Harvey. Cooper's chief policies were the strengthening of the public schools, the creation of a budget system and the consolidation of the management of charitable and correctional institutions.

The Australian form of ballot was put into force (1921) in primaries but not in general elections, the latter being merely ratification of the former, as the Democratic nomination is equivalent to election. Thomas G. McLeod was elected governor in 1922 and again in 1924. His principal policies consisted of liberal appropriations for education, the consolidation and systematising of state administrative offices, the improvement of prison conditions and the promotion of tax equalisation. Renewed efforts for changing from annual to biennial sessions of the Legislature failed in 1925 because of unforeseen technical difficulties. Constitutional amendments changed the terms of the governor and other state officials from two to four years, beginning with those elected in 1926. The governor is not eligible to re-election. An extensive system of improved highways was under construction for about 10 years, and was still far from complete in 1926.

See Yates Snowden (editor), *History of South Carolina* (5 vols., two of history and three of biographies); W. G. Simms, *The History of South Carolina*, ed. M. C. S. Oliphant (1918); *Public Documents of South Carolina*. (D. D. W.)

**SOUTH DAKOTA** (see 25,506), a State of the United States of America. The population in 1925 was 681,560 (South Dakota State Census), as compared with 636,547 in 1920 and 583,888 in 1910. The average density in 1925 was nine per square mile. The rural population in 1925 was 561,870, and the urban 119,690, as against 534,675 and 101,872 in 1920. From 1910 to 1920 the rural population increased 5.4% and the urban nearly 33%. The chief towns and their populations in 1925 were Sioux Falls 30,127; Aberdeen 15,035; Watertown 10,319; Huron, 10,204; and Mitchell 10,119. The foreign-born population, consisting very largely of Scandinavians, Germans and Russians, decreased until in 1925 it constituted less than one-eighth of the total.

**Communications.**—There are 4,486 m. of steam railways; the road mileage is 115,390, which is maintained by direct and indirect taxation. More than \$15,000,000 has been expended through federal, state and county aid and by private individuals, in the construction of good roads, bridges and culverts. Four large bridges have been built across the Missouri river, and two others were in progress of construction in 1925. The first and best of the six bridges was built at Yankton, connecting South Dakota with Nebraska; it is on the Meridian Highway, which crosses the State and extends from Winnipeg, Canada, to the Gulf of Mexico. The State Legislature of 1921 provided for a tenth of a mill tax for the purpose of creating a Bridge Fund. Five bridges were built as a result—the Wheeler (or Rosebud), Pierre, Mobridge, Chamberlain and Forest City. They are on the main highways crossing the State from east to west. In the first nine months of 1925 licences were issued for 149,370 automobiles, 13,300 trucks and 320 motor cycles.

**Education.**—The total expenditure on education in 1923-4 was \$18,425,309. In that educational year the 5,305 elementary schools contained 137,460 pupils and 7,046 teachers; 624 secondary schools had 1,348 teachers and 25,128 pupils. Between the ages of 8 and 16 attendance at a public day school is compulsory on all not otherwise taught.

**Agriculture.**—The farm acreage in 1925 was 34,636,491 of which 24,101,202 ac. were improved land. In 1925 there were 76,174 farmers, of whom 41,751 were owners and 34,423 renters. Farms have become more numerous and, on the average, somewhat smaller: more are now worked by renters. The table below shows the principal agricultural products of the State and their values in 1920 and 1925.

|              | Year | Production      | Value        |
|--------------|------|-----------------|--------------|
| Corn (maize) | 1925 | 83,405,000 bu.  | \$50,043,000 |
|              | 1920 | 105,600,000 bu. | 46,494,000   |
| Wheat        | 1925 | 32,378,000 bu.  | 41,429,000   |
|              | 1920 | 29,790,000 bu.  | 38,727,000   |
| Oats         | 1925 | 100,198,000 bu. | 28,055,000   |
|              | 1920 | 75,446,000 bu.  | 26,406,000   |
| Barley       | 1925 | 23,608,000 bu.  | 11,096,000   |
|              | 1920 | 22,825,000 bu.  | 13,695,000   |
| Potatoes     | 1925 | 3,965,000 bu.   | 7,137,000    |
|              | 1920 | 8,904,000 bu.   | 8,637,000    |
| Flax Seed    | 1925 | 3,801,000 bu.   | 8,552,000    |
|              | 1920 | 2,220,000 bu.   | 3,630,000    |
| Hay          | 1925 | 3,268,000 tons  | 30,704,000   |
|              | 1920 | 1,750,000 tons  | 14,875,000   |

The receipts from dairy produce in 1925 were estimated at \$31,000,000. There were 745,000 horses, 14,000 mules, 682,000 sheep, 2,400,000 swine, 461,864 dairy cows, and 1,246,000 other cattle in the State on Jan. 1 1925.

**Manufactures.**—The principal industries in 1925 were packing and canning goods, flourmill and gristmill products, bread and other bakery products, printing and publishing, automobile and truck repairing, cars and general shop construction and repairs by steam railway companies, lumber and timber products.

**Finance.**—The bank deposits were \$219,594,314 in 1922; \$233,804,397 in 1923; \$177,806,995 in 1924, and \$189,841,520 in 1925. The total assessed valuation of all taxable property was \$1,977,127,560 in 1922; \$1,940,998,027 in 1923; and \$1,876,112,764 in 1924. The tax levied in 1921, 1922 and 1923 was \$33,006,021; \$32,724,800, and \$32,568,923. The expenditure for the

State Govt. educational, charitable and penal institutions was \$9,711,964 in 1920; \$18,389,586 in 1924. The State's bonded indebtedness in 1924 was \$62,350,000, \$47,500,000 of which was loaned by the Rural Credit Board to farmers; \$2,000,000 was invested in cement plant; \$5,950,000 was used for construction of highways; \$6,000,000 for soldiers' bonus and \$900,000 for soldiers' land settlement. The debt had been reduced to \$61,500,000 by 1925.

**Political History.**—The Republican party remained in control of the State Govt. from 1909 to 1926. The governors were Robert S. Vessey, 1909-13; Frank M. Byrne, 1913-7; Peter Norbeck, 1917-21; William McMaster, 1921-5; Carl Gunderson, 1925. Norbeck was elected to the United States Senate in 1920, and McMaster in 1924. (C. C. \*)

**SOUTHEND-ON-SEA**, England (see 25,510), with a population of 106,070 in 1921, estimated in 1925 at 117,000, and an area of 7,082 ac., has grown with great rapidity. It was created a country borough in 1914, Leigh and part of Eastwood having been included in 1913. The parishes of Leigh, Prittlewell, Southchurch, and part of Eastchurch, have been constituted one parish with that of Southend, so that the boundaries of the parish and the borough are now coterminous. Southend has returned one member to Parliament since 1918. Practically the whole of the cliffs from the Alexandra yacht club to Sharefields are in the hands of the corporation, and a scheme of improvements is being carried out: there are nearly seven miles of esplanades. Eleven acres of land off Sutton road were given to the town in 1914 and opened as a recreation ground in 1920, and the Victory sports ground was given in 1921. The Belfairs estate of 270 ac., to the northwest of Leigh, was acquired by the corporation in 1919; Prittlewell Priory, presented to the borough in 1917, has been restored, and now houses a museum removed from the public library; Southchurch Hall, a mediæval house, and its grounds were acquired in 1925. A War memorial on the cliffs was unveiled in 1921. In 1925 a new arterial road to London was opened. There were a number of air raids over Southend during the World War, and 32 people were killed in one which took place in 1917.

**SOUTH SEA ISLANDS:** see OCEANIA.

**SOUTH SHIELDS**, England (see 25,516), a thriving port and the chief outlet for the collieries of Northumberland and Durham, had a population of 116,635 in 1921, and an area of 2,339 ac. of land and inland water (not including the area added in that year). In 1918 Cleadon Park of 196 ac., with a mansion since made into a tuberculosis sanatorium, to the south of Harton, was bought for a housing scheme. An isolation hospital was built on part of the estate, and a light railway of 1½ m. has been laid. In 1921 the new suburb and Harton village were added to the borough; the number of aldermen was increased to 15, and of councillors to 45. Twenty ac. of land were acquired for a cemetery in 1917, and Readhead Park of 7½ ac. in 1922. New municipal buildings were opened in Westoe Road in 1910, and a statue of Queen Victoria unveiled in front of the main entrance in 1913; the old town hall is used by a branch of the Imperial Merchants' Service Guild. A cenotaph in memory of men from the western end of the town was erected at Tyne dock in 1921. Constant dredging is carried on to maintain a depth of 30 ft. in the channel of the Tyne as far as the Northumberland dock.

**SOUTHWEST AFRICA** (see 11,800c), a mandated territory in South Africa, formerly German Southwest Africa. The administration of the country is vested in the Government of the Union of South Africa, under a mandate conferred by "the Allied and Associated Powers," which took effect from Dec. 17 1920. No change has been made in the area of the territory, which covers 322,393 sq. miles. The administration of the north-western extension towards the Zambesi, known as the "Caprivi Zipfel" (10,573 sq. m. in area) has been delegated to the High Commissioner for South Africa, and attached to the Bechuanaland Protectorate, while Walvis Bay (374 sq. m.) is included in the mandated territory. The area of the territory administered by the mandatory is therefore 312,194 sq. miles. Population

(census of May 3 1921) 227,739, of whom 19,500 were whites and 5,000 of mixed native and European descent.

## I. POLITICAL HISTORY

After the conquest of German Southwest Africa in July, 1915, the administration was carried on under martial law to the end of 1920. By the Treaty of Versailles (Article 119) Germany ceded her colonies to the Allies, and Article 22 indicated Southwest Africa as a territory which should in future be administered under the laws of the mandatory, as an integral part of its own territory. Accordingly, on Dec. 17 1920, a mandate was conferred on His Britannic Majesty "for and on behalf of the Government of the Union of South Africa," that Government having already (Sept. 1919) been authorised by its Parliament to accept it (Act 49 of 1919).

The mandate conferred full powers of administration and legislation, subject to the mandate, which prescribed the prohibition of the slave trade and of forced labour for any purpose other than essential public works and services; the control of the traffic in arms and ammunition; prohibition of the supply of intoxicating liquor to natives; prohibition of military training of natives except for police and internal defence, and of military and naval bases in the territory; freedom of conscience and worship; and finally that an annual report on the administration should be submitted to the Council of the League of Nations. The Union Govt. by Act No. 49, acquired parliamentary sanction to delegate its authority, but all laws were to be submitted to Parliament, and specific authority was required before the administrator could grant State lands or minerals, or any trading or other concessions, or alienate native reserves.

In Jan. 1921, by proclamation of the Governor-General, martial law was replaced by a civil administration under an administrator, to whom his powers of legislation were delegated. In accordance with the recommendations of a parliamentary commission set up in 1920, an Advisory Council of eight unofficial, and one official member, representing the native interests, was appointed by the administrator to advise on general policy, on the raising and expending of revenue, and on any other matter on which its advice might be asked.

*Law.*—The law of the territory consists in part of Acts by the Union Parliament, and in part of ordinances enacted by the administrator and approved by Parliament. The more important of the former are Act 12 of 1920, which constituted the supreme court of the Union as an appellate court for the territory; Act 35 of 1921, which included it in the Customs Union; Act 20 of 1922, which vested the railways and harbours in the Union Government and placed them under its management; Act 27 of 1923, which amalgamated the civil services; and Act 30 of 1924, relative to the status of Germans. This last demands a word of explanation.

It was the declared policy of the Union to accept the Germans "as part of the people with the same privileges and the same responsibilities as the others." German immigrants had been welcomed, and 1,361 had arrived from overseas by the end of 1922. The question of their status was the first and most pressing problem. It was decided, with the consent of the League Council, to enact a law by which every German should automatically acquire the status of a British subject *in the Union*, unless he declined it before a given date. The proposal was opposed by the Germans at Windhoek, though welcomed by others, and it was not till Oct. 1923, that an agreement was reached between General Smuts and two representatives of the German Government. The mandatory pledged itself to allow German to be an official language and used in German schools; it accepted liability for the pensions of German ex-civil servants, and agreed that Germans should not be liable for military service against Germany for 30 years. The agreement was given legal sanction by Act. 30 of 1924.

*Form of Government.*—The settlement of this question enabled the mandatory to turn its attention to the form of government which should replace the transitional rule of the administrator. In 1924 the Premier, General Hertzog, toured the country, and declared that the demand of the Europeans for some form of self-government ought to be satisfied. An Act, No. 42 of 1925, was passed the next year. The territory was divided into 12

constituencies, each electing a member for the Legislative Assembly, to which six more were nominated by the Union Government. Certain subjects were absolutely reserved to the Cape Parliament. These were the control of mines and minerals, railways and harbours, the public service, the courts of justice, the posts and telegraphs, defence, immigration, customs tariffs, currency and banking, and native affairs. Education, police, aviation, the disposal of land and the control of land banks, were temporarily reserved.

An executive of five members, under the chairmanship of the administrator, is elected by the Assembly. The administrator also exercises executive functions in respect of reserved subjects, and is then aided by an Advisory Council of four executive councillors and three nominees of his own, including one with knowledge of native affairs. The native population, which outnumbers the Europeans by 10 to one, has neither direct representation nor the right to vote. The total number of the adult male Europeans who exercise that right is 6,500. The Union Govt. retains full powers of legislation and veto, since as mandatory it alone is responsible to the League of Nations.

*Revenue and Defence.*—The revenue of the territory is about £850,000, nearly half of which is derived from royalties on the diamond mines. The ordinary expenditure has been in the neighbourhood of £650,000, and a considerable surplus has accumulated. The police force consists of about 280 white, and 240 natives. Native farm labour is paid 10 s. to 20 s. per month with food. The administration is endeavouring to create adequate reserves for the natives and coloured people, and large areas of waterless land have been reclaimed for this purpose by well boring.

*Native Risings.*—The administration has been faced with two native risings. The first, by a small body of Bondelzwarts, who were irritated by certain regulations regarding cattle branding, taxes on dogs, and other matters, was suppressed with considerable loss of life, which gave rise to some adverse criticism. The second, by a small body of "Bastards" (Rehoboths) who claimed complete autonomy, was dispersed without bloodshed.

## II. PRODUCTION AND TRADE

Southwest Africa is largely a cattle-raising and sheep-farming country. The absence of water renders large-scale agriculture almost impossible, for the only rivers with a constant flow are the Kunene and Okavango in the extreme north; the territory depends for its permanent supply of water upon subterranean streams, which are tapped by sinking wells and boreholes. Small crops of maize, potatoes, cotton, pumpkins and beans are raised, and with the development of irrigation considerable possibilities should arise for the cultivation of wheat and the extension of cotton. Dairy farming is making progress and several creameries have been established; the production of butter and cheese is increasing. The territory contains extensive mineral deposits. The most valuable product is diamonds, the value of which in 1924 was £1,224,440. Copper and lead (value £571,152), next vanadium (£83,435) and tin (£31,400) are also worked, while silver and other minerals are believed to exist, but are not exploited. The gold exported in 1922 amounted to 147 ounces. Large deposits of guano are found along the coast. The bulk of the trade of the territory is with the Union of South Africa.

The development of agriculture is indicated by the increasing imports of agricultural machinery and implements, fertilisers, power lorries and steam wagons: the increase in the export of cotton from 914,268 lb. in 1921 to 3,299,388 lb. in 1924 shows the steady development in the cultivation of cotton. The larger imports of mining machinery and the increased exports of copper, lead and vanadium also indicate the development of the mineral resources of the territory. The progress made by cattle raising and sheep and dairy farming is shown by the increasing exports of cattle, sheep and butter to the Union of South Africa. The export of diamonds, valued in 1924 at £1,395,846, was entirely to the United Kingdom; copper ore was mainly exported to Belgium, and vanadium ore to Germany and the United Kingdom.

*Communications and Finance.*—The railway system of the territory, before the occupation by the Union, linked up the ports of Luderitz and Swakopmund with Kalkfontein in the south, Windhoek in the central area, and Tsumeb and Grootfontein in the north. In 1915 a line was completed between Kalkfontein and Prieska, a distance of 315½ m., connecting the system, with that of the Union. A short line was also constructed from Walvis Bay to the former German system, thus completing a network of railways which links up Walvis Bay and Luderitz with Cape Town, Port Elizabeth, Durban and other South African ports, and with Lourenço Marques and Beira on the east coast. The chief ports are Walvis Bay and

Luderitz: Swakopmund has been permanently closed as a port, and the whole of the landing and shipping work transferred to Walvis Bay, which is now the regular port of call for mail steamers. A wireless station has been erected there. Branches of the National Bank of South Africa (now Barclay's Dominion, Colonial and Overseas Bank) and the Standard Bank of South Africa have been established in the chief towns.

**BIBLIOGRAPHY.**—A. J. Toynbee, *Survey of International Affairs, 1920-3* (1925), pp. 397-417, where a list of documents is given, (F. D. L.)

**SOUTHWEST AFRICA, CAMPAIGN IN.**—For some time before the year 1914 the proximity of the German Protectorate of Southwest Africa, sharing a common frontier on its southern and eastern borders with the Union of South Africa, had been recognised by the Government of the latter country as an important factor in its military arrangements.

On Aug. 6 1914 the Union Govt. undertook to assume all obligations resting upon the British regular garrison in South Africa, and, on Aug. 10, to send a military expedition of its own against German Southwest Africa. The British Govt. accepted both offers, and indicated the enemy seaports and the wireless installation at Windhuk as the first objectives of the military venture. Early action was vital in view of the position of South Africa on the ocean route between Europe and Asia, and the necessity for denying harbours and facility for long range communication to the enemy naval squadron in the South Atlantic.

**Arrival of British Troops.**—Between Aug. 31 and Sept. 18 a mixed force under Brig. Gen. Lukin was disembarked at Port Nolloth and disposed thence eastwards along the southern enemy border to Steinkopf, the line of observation being continued to Upington by another force under Lt. Col. Maritz. The first Union troops to occupy enemy territory were those commanded by Col. Beves, which landed unopposed at Luderitzbucht on Sept. 18. On Sept. 9 Maritz, with the greater portion of his command deserted to the enemy, actuated by the same motives as induced a small part of the Dutch population of the Union, which had displayed strong antagonism to the war policy of their government, to go into rebellion in October. Though only some 11,000 rebels took the field, 30,000 loyal troops were needed to quell the rebellion, and offensive action against the enemy was delayed for four months. A strong advanced Union detachment with 2 guns was captured in enemy territory at Zandfontein on Sept. 26, a reverse to which the treachery of Maritz was largely contributory.

Meanwhile Louis Botha had assumed command of all the South African forces on the outbreak of the rebellion, and on its conclusion on Feb. 3 1915, left Cape Town to conduct the postponed offensive against the enemy. The leading units of the force which was to operate under his immediate command reached Walvis Bay in Union territory on Dec. 25 under Col. Skinner, who on Jan. 13 occupied the northernmost enemy port of Swakopmund. Gen. Botha reached Swakopmund on Feb. 11.

**Disposition of Forces.**—The position then was that the northern force (Gen. Botha) held Walvis Bay and Swakopmund, facing the troops of the enemy chief command (Lt. Col. Franke). The central force (Brig. Gen. Sir D. McKenzie) occupied Luderitzbucht with its forward troops at Tshaukaib, 40 m. inland, in touch with the enemy on the railway line to Keetmanshoop. The southern force (Brig. Gen. Van. Deventer) watched the German force (Major Ritter) on the southern enemy border. The eastern force (Col. Berrangé), considerably smaller than the rest, was mobilising for an advance along the Kuruman and Molopo rivers against the eastern border of the enemy, whose detachments here lay at Rietfontein and Hasuur. The northern and central forces had strong infantry formations, though mounted troops predominated in the former, while the two other forces were composed of mounted units. Heavy and field artillery were allotted as the nature of the task of each force suggested, and valuable aid was afforded by the presence of officers from the Royal Marine Artillery in the heavy batteries. The Royal Navy conveyed, escorted and disembarked the whole of the forces and their supplies from the base at Cape Town.

**The Scene of Operations.**—The greater portion of the theatre of the campaign's 322,350 square miles in area is a plateau 3,500 ft. above sea level. A barren waterless tract, 40 to 100 m. broad on the coast side and 200 inland, intervenes between the first rise to the plateau and the border. Water is extremely scarce everywhere, and the water holes were well known and far apart. The country is very sandy and often rough. The climate is dry and healthy for man and beast, though malaria occurs in the wet season in the north. Cattle were plentiful, all other supplies, including fodder, scanty. The scene of operations was thus badly watered, difficult to move in and devoid of supplies, and the interior was protected by a desolate belt of desert. A railway (3 ft. 6-in. gauge) ran from Luderitzbucht to Keetmanshoop in the south, thence north to Windhuk and from there west to Karibib. An extension to Kalkfontein in the south branched from the Luderitzbucht-Keetmanshoop section at Seeheim, a total length of 800 miles. From Swakopmund a 2-ft. gauge line ran to Karibib and thence north to Tsumeb and Grootfontein, a total length of 420 miles. The lines were much damaged by the enemy and the Union engineers repaired 1,040 m. and laid 340 m. of new line during the campaign. The enemy forces consisted of 2,000 soldiers and 140 officers and in addition 7,000 male Europeans, many with military training. Of military material and equipment the German commander had abundance; he enjoyed throughout a substantial advantage in respect of artillery.

**Botha's Campaign.**—On Feb. 23, Gen. Botha moved from Swakopmund and secured Rössing on the railway line and Husab on the Swakop river. The river route was selected for the main advance, and on March 18, after careful and tedious preparations Gen. Botha again advanced and heavily defeated the enemy at Riet and Pforte in the Swakop valley, capturing 2 guns and 284 prisoners. Sixty miles of the river route were now secured, and, after another period of preparation, a third advance was made on April 26 and Karibib occupied on May 5, after a series of rapid turning movements by mounted troops. The enemy withdrew to the north and Windhuk was occupied on May 12.

**The Auxiliary Movements.**—Gen. Botha's infantry (Skinner) had meantime advanced along the railway and occupied Usakos. On March 30 the central force occupied Aus, and on April 26 at Gibeon, McKenzie's mounted troops, after rapid sustained marching, overtook and heavily attacked the enemy retiring from the south. The eastern force (Berrangé) left Kuruman on March 6 and joined hands with the southern force on April 20 at Kabus. The southern force (Gen. Smuts) defeated the enemy at Nabas on March 8 and at Kabus on April 20. The capital occupied, all the country to the south fell into Gen. Botha's hands.

A conference between the Union Commander and Gov. Seitz at Giftkuppe on May 21 proved abortive and the final stage of the campaign against the enemy, now concentrated in the north, ensued. After reorganisation and settlement of the occupied territory, Gen. Botha advanced from Karibib on June 18. The main body (mounted troops and infantry) moved in the centre with the commander-in-chief, while strong mounted forces operated to the east and west commanded respectively by Myburgh and Brits. The enemy retired rapidly, and on June 27 Brits was ordered to move widely to the northwest and head the enemy off at Namutoni, while Myburgh was to swing in on Tsumeb from the east. These movements were carried out exactly and the enemy, defeated on July 1 at Otavi by the leading mounted brigade of the centre, forestalled at Namutoni, and having lost Tsumeb, surrendered on July 9 1915.

**Conclusion.**—The campaign had been won with little loss of life—127 Union soldiers were killed in the rebellion and in German Southwest Africa, but it will repay study as an instance of success in spite of difficulties in climate and terrain, and for the experience which it afforded of the value of fertility of resource and power of adaptation. Some of the obstacles which were surmounted seemed almost impossible to deal with, and the methods adopted in connection with water supply are worthy of close attention. Some magnificent marching was a striking feature of all the operations. Brits's force on the final advance marched 340 m. in 20 days; McKenzie's mounted troops covered

200 m. in 12 days; while the infantry brigade in the centre in the concluding operations in 16 days marched 230 miles. Finally, the campaign reveals the extraordinary mobility of mounted riflemen when good horsemen are directed by a master hand.

**SOVA, ANTONIN** (1864–1913), Czech poet, began his literary career early in the 'nineties with descriptive verse, the subject-matter of which was derived from the streets of Prague and from his native region of Southern Bohemia. His introspective poems, notably those contained in the volumes *Lyrics of Love and Life*, *Mastered Sorrows* and *Once Again Shall We Return*, include some of the finest lyrical poems in the Czech language, and have been compared, not without justification, with Verlaine. The disillusionment caused by the poet's contact with the realities of life drove him to seek escape in a dream-world of his own, and this theme was treated in a series of visionary poems which reveal Sova as a master of symbolism. In 1913 appeared *Harvests*, a volume in which moods of a mature reconciliation predominate. In the succeeding decade Sova exhibited an unusual fecundity. The poems of this later period are written with the crystalline simplicity of folk songs, and there are others in which Sova is shown as one of the most enlightened spokesmen of Czech aspirations. He also wrote a number of novels and short stories.

**SOYA BEAN:** see OILS AND FATS.

**SPA, CONFERENCE OF** (July 5–16 1920).—This was the first occasion after the War of 1914–8 on which the heads of the German and Allied Governments negotiated on a formal footing of equality. At the same time, at Spa, as at Versailles, the Allies resorted to dictation, and negotiations resulting in an agreed settlement did not take place until the London reparations conference of July and Aug. 1924. The Germans were represented by the chancellor, Herr Fehrenbach; the Foreign Minister Dr. Simons; and the Finance Minister, Dr. Wirth. The crucial questions at issue were the execution of the disarmament clauses and the coal delivery clauses of the Treaty of Versailles, and in both cases the Germans were compelled to sign protocols dictated by the Allies under threat of military sanctions which were set out in the documents and in both cases included an eventual Allied occupation of the Ruhr basin. In the coal negotiations, the Allies were exasperated by the pugnacious tone of Herr Stinnes, who gave evidence on behalf of the German coal-owners, but the protocol afterwards signed was remarkable inasmuch as it provided for partial cash payments by the Allies.

A German proposal for the general settlement of the reparation problem was rejected, but on this occasion no general Allied counter-proposal was put forward. In regard to reparations, the chief permanent achievement at Spa was the inter-Allied agreement regarding the allocation of prospective German payments, an agreement which has since been modified in detail, but which still governs the situation. It was provided that France should receive 52% of sums obtained from Germany, the British Empire 22%, Italy 10% and Belgium 8%, while the remaining 8% was to be divided between the other Allied Powers. By a subsequent agreement among the several members of the British Commonwealth, 86-85% of the British Empire's share was allocated to Great Britain. Another article in the Spa Agreement provided for the allocation of reparation payments from Austria, Bulgaria and Hungary, and "cost of liberation" payments from Italy, Czechoslovakia, Rumania and Yugoslavia.

At the Spa Conference the Supreme Council also came to an agreement with Germany regarding the trial of war criminals, dealt with the Teschen question and rejected the objections of the Constantinople Govt. to the draft Treaty of Sévres.

(A. J. T.)

**SPACE-TIME** (see 25-525).—All our thoughts and concepts are called up by sense-experiences and have a meaning only in reference to these sense-experiences. On the other hand, however, they are products of the spontaneous activity of our minds; they are thus in no wise logical consequences of the contents of

these sense-experiences. If, therefore, we wish to grasp the essence of a complex of abstract notions we must for the one part investigate the mutual relationships between the concepts and the assertions made about them; for the other, we must investigate how they are related to the experiences.

So far as the way is concerned in which concepts are connected with one another and with the experiences there is no difference of principle between the concept-systems of science and those of daily life. The concept-systems of science have grown out of those of daily life and have been modified and completed according to the objects and purposes of the science in question.

The more universal a concept is the more frequently it enters into our thinking; and the more indirect its relation to sense-experience, the more difficult it is for us to comprehend its meaning; this is particularly the case with pre-scientific concepts that we have been accustomed to use since childhood. Consider the concepts referred to in the words "where," "when," "why," "being," to the elucidation of which innumerable volumes of philosophy have been devoted. We fare no better in our speculations than a fish which should strive to become clear as to what is water.

## I. SPACE

In the present article we are concerned with the meaning of "where," that is, of space. It appears that there is no quality contained in our individual primitive sense-experiences that may be designated as spatial. Rather, what is spatial appears to be a sort of order of the material objects of experience. The concept "material object" must therefore be available if concepts concerning space are to be possible. It is the logically primary concept. This is easily seen if we analyse the spatial concepts for example, "next to," "touch," and so forth, that is, if we strive to become aware of their equivalents in experience. The concept "object" is a means of taking into account the persistence in time or the continuity, respectively, of certain groups of experience-complexes. The existence of objects is thus of a conceptual nature, and the meaning of the concepts of objects depends wholly on their being connected (intuitively) with groups of elementary sense-experiences. This connection is the basis of the illusion which makes primitive experience appear to inform us directly about the relation of material bodies (which exist, after all, only in so far as they are thought).

In the sense thus indicated we have (the indirect) experience of the contact of two bodies. We need do no more than call attention to this, as we gain nothing for our present purpose by singling out the individual experiences to which this assertion alludes. Many bodies can be brought into permanent contact with one another in manifold ways. We speak in this sense of the position-relationships of bodies (*Lagenbeziehungen*). The general laws of such position-relationships are essentially the concern of geometry. This holds, at least, if we do not wish to restrict ourselves to regarding the propositions that occur in this branch of knowledge merely as relationships between empty words that have been set up according to certain principles.

*Pre-scientific Thought.*—Now, what is the meaning of the concept "space," which we also encounter in pre-scientific thought? The concept of space in pre-scientific thought is characterised by the sentence: "we can think away things but not the space which they occupy." It is as if, without having had experience of any sort, we had a concept, nay even a presentation, of space and as if we ordered our sense-experiences with the help of this concept, present *a priori*. On the other hand, space appears as a physical reality, as a thing which exists independently of our thought, like material objects. Under the influence of this view of space the fundamental concepts of geometry: the point, the straight line, the plane, were even regarded as having a self-evident character. The fundamental principles that deal with these configurations were regarded as being necessarily valid and as having at the same time an objective content. No scruples were felt about ascribing an objective meaning to such statements as "three empirically given bodies (practically infinitely small) lie on one straight line," without demanding a physical definition

for such an assertion. This blind faith in evidence and in the immediately real meaning of the concepts and propositions of geometry became uncertain only after non-Euclidean geometry had been introduced.

*Reference to the Earth.*—If we start from the view that all spatial concepts are related to contact-experiences of solid bodies, it is easy to understand how the concept "space" originated, namely, how a thing independent of bodies and yet embodying their position-possibilities (*Lagerungsmöglichkeiten*) was posited. If we have a system of bodies in contact and at rest relatively to one another, some can be replaced by others. This property of allowing substitution is interpreted as "available space." Space denotes the property in virtue of which rigid bodies can occupy different positions. The view that space is something with a unity of its own is perhaps due to the circumstance that in prescientific thought all positions of bodies were referred to one body (reference body), namely the earth. In scientific thought the earth is represented by the co-ordinate system. The assertion that it would be possible to place an unlimited number of bodies next to one another denotes that space is infinite. In prescientific thought the concepts "space" and "time" and "body of reference" are scarcely differentiated at all. A place or point in space is always taken to mean a material point on a body of reference.

*Euclidean Geometry.*—If we consider Euclidean geometry we clearly discern that it refers to the laws regulating the positions of rigid bodies. It turns to account the ingenious thought of tracing back all relations concerning bodies and their relative positions to the very simple concept "distance" (*Strecke*). Distance denotes a rigid body on which two material points (marks) have been specified. The concept of the equality of distances (and angles) refers to experiments involving coincidences; the same remarks apply to the theorems on congruence. Now, Euclidean geometry, in the form in which it has been handed down to us from Euclid, uses the fundamental concepts "straight line" and "plane" which do not appear to correspond, or at any rate, not so directly, with experiences concerning the position of rigid bodies. On this it must be remarked that the concept of the straight line may be reduced to that of the distance.<sup>1</sup> Moreover, geometers were less concerned with bringing out the relation of their fundamental concepts to experience than with deducing logically the geometrical propositions from a few axioms enunciated at the outset.

Let us outline briefly how perhaps the basis of Euclidean geometry may be gained from the concept of distance.

We start from the equality of distances (axiom of the equality of distances). Suppose that of two unequal distances one is always greater than the other. The same axioms are to hold for the inequality of distances as hold for the inequality of numbers.

Three distances  $\overline{AB}$ ,  $\overline{BC}$ ,  $\overline{CA}$  may, if  $\overline{CA}$  be suitably chosen, have their marks  $BB'$ ,  $CC'$ ,  $AA'$  superposed on one another in such a way that a triangle  $ABC$  results. The distance  $\overline{CA}$  has an upper limit for which this construction is still just possible. The points  $A$ , ( $BB'$ ) and  $C$  then lie in a "straight line" (definition). This leads to the concept: producing a distance by an amount equal to itself; dividing a distance into equal parts; expressing a distance in terms of a number by means of a measuring-rod (definition of the space-interval between two points).

When the concept of the interval between two points or the length of a distance has been gained in this way we require only the following axiom (Pythagoras' theorem) in order to arrive at Euclidean geometry analytically.

To every point of space (body of reference) three numbers (co-ordinates)  $x$ ,  $y$ ,  $z$  may be assigned—and conversely—in such a way that for each pair of points  $A(x_1, y_1, z_1)$  and  $B(x_2, y_2, z_2)$  the theorem holds:

$$\text{measure-number } AB = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

<sup>1</sup> A hint of this is contained in the theorem: "the straight line is the shortest connection between two points." This theorem served well as a definition of the straight line, although the definition played no part in the logical texture of the deductions.

All further concepts and propositions of Euclidean geometry can then be built up purely logically on this basis, in particular also the propositions about the straight line and the plane.

These remarks are not, of course, intended to replace the strictly axiomatic construction of Euclidean geometry. We merely wish to indicate plausibly how all conceptions of geometry may be traced back to that of distance. We might equally well have epitomised the whole basis of Euclidean geometry in the last theorem above. The relation to the foundations of experience would then be furnished by means of a supplementary theorem.

The co-ordinate may and *must* be chosen so that two pairs of points separated by equal intervals, as calculated by the help of Pythagoras' theorem, may be made to coincide with one and the same suitably chosen distance (on a solid).

The concepts and propositions of Euclidean geometry may be derived from Pythagoras' proposition without the introduction of rigid bodies; but these concepts and propositions would not then have contents that could be tested. They are not "true" propositions but only logically correct propositions of purely formal content.

*Difficulties.*—A serious difficulty is encountered in the above represented interpretation of geometry in that the rigid body of experience does not correspond *exactly* with the geometrical body. In stating this I am thinking less of the fact that there are no absolutely definite marks than that temperature, pressure and other circumstances modify the laws relating to position. It is also to be recollected that the structural constituents of matter (such as atom and electron, *q.m.*) assumed by physics are not in principle commensurate with rigid bodies; but that nevertheless the concepts of geometry are applied to them and to their parts. For this reason consistent thinkers have been disinclined to allow real contents of facts (*reale Tatsachenbestände*) to correspond to geometry alone. They considered it preferable to allow the content of experience (*Erfahrungsbestände*) to correspond to geometry and physics conjointly.

This view is certainly less open to attack than the one represented above; as opposed to the atomic theory it is the only one that can be consistently carried through. Nevertheless, in the opinion of the author it would not be advisable to give up the first view, from which geometry derives its origin. This connection is essentially founded on the belief that the ideal rigid body is an abstraction that is well rooted in the laws of nature.

*Foundations of Geometry.*—We come now to the question: what is *a priori* certain or necessary, respectively in geometry (doctrine of space) or its foundations? Formerly we thought everything—yes, everything; nowadays we think—nothing. Already the distance-concept is logically arbitrary; there need be no things that correspond to it, even approximately. Something similar may be said of the concepts straight line, plane, of three-dimensionality and of the validity of Pythagoras' theorem. Nay, even the continuum-doctrine is in no wise given with the nature of human thought, so that from the epistemological point of view no greater authority attaches to the purely topological relations than to the others.

*Earlier Physical Concepts.*—We have yet to deal with those modifications in the space-concept, which have accompanied the advent of the theory of relativity. For this purpose we must consider the space-concept of the earlier physics from a point of view different from that above. If we apply the theorem of Pythagoras to infinitely near points, it reads

$$ds^2 = dx^2 + dy^2 + dz^2$$

where  $ds$  denotes the measurable interval between them. For an empirically-given  $ds$  the co-ordinate system is not yet fully determined for every combination of points by this equation. Besides being translated, a co-ordinate system may also be rotated.<sup>2</sup> This signifies analytically: the relations of Euclidean geometry are covariant with respect to linear orthogonal transformations of the co-ordinates.

<sup>2</sup> Change of direction of the co-ordinate axes while their orthogonality is preserved.

In applying Euclidean geometry to pre-relativistic mechanics a further indeterminateness enters through the choice of the co-ordinate system: the state of motion of the co-ordinate system is arbitrary to a certain degree, namely, in that substitutions of the co-ordinates of the form  $x' = x - vt$

$$\begin{aligned} y' &= y \\ z' &= z \end{aligned}$$

also appear possible. On the other hand, earlier mechanics did not allow co-ordinate systems to be applied of which the states of motion were different from those expressed in these equations. In this sense we speak of "inertial systems." In these favoured-inertial systems we are confronted with a new property of space so far as geometrical relations are concerned. Regarded more accurately, this is not a property of space alone but of the four-dimensional continuum consisting of time and space conjointly.

*Appearance of Time.*—At this point time enters explicitly into our discussion for the first time. In their applications space (place) and time always occur together. Every event that happens in the world is determined by the space-co-ordinates  $x, y, z$ , and the time-co-ordinate  $t$ . Thus the physical description was four-dimensional right from the beginning. But this four-dimensional continuum seemed to resolve itself into the three-dimensional continuum of space and the one-dimensional continuum of time. This apparent resolution owed its origin to the illusion that the meaning of the concept "simultaneity" is self-evident, and this illusion arises from the fact that we receive news of near events almost instantaneously owing to the agency of light.

This faith in the absolute significance of simultaneity was destroyed by the law regulating the propagation of light in empty space or, respectively, by the Maxwell-Lorentz electrodynamics. Two infinitely near points can be connected by means of a light-signal if the relation

$$ds^2 = c^2 dt^2 - dx^2 - dy^2 - dz^2 = 0$$

holds for them. It further follows that  $ds$  has a value which, for arbitrarily chosen infinitely near space-time points, is independent of the particular inertial system selected. In agreement with this we find that for passing from one inertial system to another, linear equations of transformation hold which do not in general leave the time-values of the events unchanged. It thus became manifest that the four-dimensional continuum of space cannot be split up into a time-continuum and a space-continuum except in an arbitrary way. This invariant quantity  $ds$  may be measured by means of measuring-rods and clocks.

*Four Dimensional Geometry.*—On the invariant  $ds$  a four-dimensional geometry may be built up which is in a large measure analogous to Euclidean geometry in three dimensions. In this way physics becomes a sort of statics in a four-dimensional continuum. Apart from the difference in the number of dimensions the latter continuum is distinguished from that of Euclidean geometry in that  $ds^2$  may be greater or less than zero. Corresponding to this we differentiate between time-like and space-like line-elements. The boundary between them is marked out by the element of the "light-cone"  $ds^2 = 0$  which starts out from every point. If we consider only elements which belong to the same time-value, we have

$$-ds^2 = dx^2 + dy^2 + dz^2$$

These elements  $ds$  may have real counterparts in distances at rest and, as before, Euclidean geometry holds for these elements.

*Effect of Relativity, Special and General.*—This is the modification which the doctrine of space and time has undergone through the restricted theory of relativity. The doctrine of space has been still further modified by the general theory of relativity, because this theory denies that the three-dimensional spatial section of the space-time continuum is Euclidean in character. Therefore it asserts that Euclidean geometry does not hold for the relative positions of bodies that are continuously in contact.

For the empirical law of the equality of inertial and gravitational mass led us to interpret the state of the continuum, in so far as it manifests itself with reference to a non-inertial system, as a gravitational field and to treat non-inertial systems as

equivalent to inertial systems. Referred to such a system, which is connected with the inertial system by a non-linear transformation of the co-ordinates, the metrical invariant  $ds^2$  assumes the general form:—

$$ds^2 = \sum_{\mu, \nu} g_{\mu\nu} dx_\mu dx_\nu$$

where the  $g_{\mu\nu}$ 's are functions of the co-ordinates and where the sum is to be taken over the indices for all combinations 11, 12, . . . 44. The variability of the  $g_{\mu\nu}$ 's is equivalent to the existence of a gravitational field. If the gravitational field is sufficiently general it is not possible at all to find an inertial system, that is, a co-ordinate system with reference to which  $ds^2$  may be expressed in the simple form given above:—

$$ds^2 = c^2 dt^2 - dx^2 - dy^2 - dz^2$$

But in this case, too, there is in the infinitesimal neighbourhood of a space-time point a local system of reference for which the last-mentioned simple form for  $ds$  holds.

This state of the facts leads to a type of geometry which Riemann's genius created more than half a century before the advent of the general theory of relativity of which Riemann divined the high importance for physics.

*Riemann's Geometry.*—Riemann's geometry of an  $n$ -dimensional space bears the same relation to Euclidean geometry of an  $n$ -dimensional space as the general geometry of curved surfaces bears to the geometry of the plane. For the infinitesimal neighbourhood of a point on a curved surface there is a local co-ordinate system in which the distance  $ds$  between two infinitely near points is given by the equation

$$ds^2 = dx^2 + dy^2$$

For any arbitrary (Gaussian) co-ordinate-system, however, an expression of the form

$$ds^2 = g_{11} dx^2 + 2g_{12} dx_1 dx_2 + g_{22} dx_2^2$$

holds in a finite region of the curved surface. If the  $g_{\mu\nu}$ 's are given as functions of  $x_1$  and  $x_2$  the surface is then fully determined geometrically. For from this formula we can calculate for every combination of two infinitely near points on the surface the length  $ds$  of the minute rod connecting them; and with the help of this formula all networks that can be constructed on the surface with these little rods can be calculated. In particular, the "curvature" at every point of the surface can be calculated; this is the quantity that expresses to what extent and in what way the laws regulating the positions of the minute rods in the immediate vicinity of the point under consideration deviate from those of the geometry of the plane.

This theory of surfaces by Gauss has been extended by Riemann to continua of any arbitrary number of dimensions and has thus paved the way for the general theory of relativity. For it was shown above that corresponding to two infinitely near space-time points there is a number  $ds$  which can be obtained by measurement with rigid measuring-rods and clocks (in the case of time-like elements, indeed, with a clock alone). This quantity occurs in the mathematical theory in place of the length of the minute rods in three-dimensional geometry. The curves for which  $\int ds$  has stationary values determine the paths of material points and rays of light in the gravitational field, and the "curvature" of space is dependent on the matter distributed over space.

Just as in Euclidean geometry the space-concept refers to the position-possibilities of rigid bodies, so in the general theory of relativity the space-time-concept refers to the behaviour of rigid bodies and clocks. But the space-time-continuum differs from the space-continuum in that the laws regulating the behaviour of these objects (clocks and measuring-rods) depend on where they happen to be. The continuum (or the quantities that describe it) enters explicitly into the laws of nature, and conversely these properties of the continuum are determined by physical factors. The relations that connect space and time can no longer be kept distinct from physics proper.

Nothing certain is known of what the properties of the space-time-continuum may be as a whole. Through the general theory of relativity, however, the view that the continuum is infinite in its time-like extent but finite in its space-like extent has gained in probability.

### TIME

The physical time-concept answers to the time-concept of the extra-scientific mind. Now, the latter has its root in the time-order of the experiences of the individual, and this order we must accept as something primarily given.

I experience the moment "now," or, expressed more accurately, the present sense-experience (*Sinnen-Erlebnis*) combined with the recollection of (earlier) sense-experiences. That is why the sense-experiences seem to form a series, namely the time-series indicated by "earlier" and "later." The experience-series is thought of as a one-dimensional continuum. Experience-series can repeat themselves and can then be recognised. They can also be repeated in exactly, wherein some events are replaced by others without the character of the repetition becoming lost for us. In this way we form the time-concept as a one-dimensional frame which can be filled in by experiences in various ways. The same series of experiences answer to the same subjective time-intervals.

The transition from this "subjective" time (*Ich-Zeit*) to the time-concept of pre-scientific thought is connected with the formation of the idea that there is a real external world independent of the subject. In this sense the (objective) event is made to correspond with the subjective experience. In the same sense there is attributed to the "subjective" time of the experience a "time" of the corresponding "objective" event. In contrast with experiences external events and their order in time claim validity for all subjects.

This process of objectification would encounter no difficulties were the time-order of the experiences corresponding to a series of external events the same for all individuals. In the case of the immediate visual perceptions of our daily lives, this correspondence is exact. That is why the idea that there is an objective time-order became established to an extraordinary extent. In working out the idea of an objective world of external events in greater detail, it was found necessary to make events and experiences depend on each other in a more complicated way. This was at first done by means of rules and modes of thought instinctively gained, in which the conception of space plays a particularly prominent part. This process of refinement leads ultimately to natural science.

The measurement of time is effected by means of clocks. A clock is a thing which automatically passes in succession through a (practically) equal series of events (period). The number of periods (clock-time) elapsed serves as a measure of time. The meaning of this definition is at once clear if the event occurs in the immediate vicinity of the clock in space; for all observers then observe the same clock-time simultaneously with the event (by means of the eye) independently of their position. Until the theory of relativity was propounded it was assumed that the conception of simultaneity had an absolute objective meaning also for events separated in space.

This assumption was demolished by the discovery of the law of propagation of light. For if the velocity of light in empty space is to be a quantity that is independent of the choice (or, respectively, of the state of motion) of the inertial system to which it is referred, no absolute meaning can be assigned to the conception of the simultaneity of events that occur at points separated by a distance in space. Rather, a special time must be allocated to every inertial system. If no co-ordinate system (inertial system) is used as a basis of reference there is no sense in asserting that events at different points in space occur simultaneously. It is in consequence of this that space and time are welded together into a uniform four-dimensional continuum. See RELATIVITY. (A. E.)

**SPADINI, ARMANDO** (1883-1925), Italian painter was born in Florence July 29 1883. He first studied art in his native city

but was chiefly inspired by the great Venetian artists, particularly by Giorgione and Paolo Veronese. His painting entitled "Giovani al bagno" secured him the Pensierato artistico nazionale, in 1910. He developed rapidly an art which was full of grace of line, sunshine and brightness of colour, and specialised in the painting of children. Two important pictures "Figure and Bambini," are in the National Gallery of Modern Art in Rome, "Musica al Pincio" is in the new Mussolini Museum also in Rome, while others are in the Florence Modern Art Gallery, in the Luxembourg, and in the Lima Museum; but his most important paintings are in private collections in Rome. He died in Rome on March 29 1925.

**SPAIN** (see 25.527), a country of southwestern Europe and a member of the League of Nations. Its area is 191,893 sq. m., and the population 21,966,000 (1925 estimate).

### I. POLITICAL HISTORY

At the close of the year 1910 Señor Canalejas resigned in order to reconstruct his Cabinet. This second Ministry, during which (Jan. 7-13) the King visited Melilla, lasted till April 3 1911, when it fell on the occasion of a debate on the Ferrer case, the army officers having resented the half-hearted attitude of Canalejas on the matter. The incident was typical of much that was to come.

The attention of Parliament was diverted towards Moroccan affairs. The French were preparing their advance on Fez, and Spain was forced to an active policy, the first signs of which were received with ill-humour by the French Press. The Government, in the teeth of popular opposition, were sending troops to Morocco, and on June 9 a Spanish force landed at Larache. France was prevented from taking strong action by the Agadir incident (see EUROPE, HISTORY), but a certain tension prevailed between France and Spain during the summer. Anti-war meetings took place in Barcelona and Madrid, and a republican rising, plotted by the lower deck of the cruiser "Numancia" anchored off Tangier, though unsuccessful, startled public opinion. A campaign of strikes led to grave disorders in Bilbao, Catalonia and Valencia, notably in Cullera, where a magistrate was mobbed to death. The Government met the situation with coolness and resolution, and towards the end of Sept. the strike fever had abated.

The Moroccan operation prepared as a consequence of the disembarkation in Larache began successfully on Dec. 6, but collapsed a few days later after a gallant attempt to force the passage of the River Kert, not without leaving behind an atmosphere of ill-feeling due to the belief, current in the Spanish Army, that the Moorish troops were provided with French arms and ammunition. Under such unfavourable conditions began the negotiations for a Franco-Spanish agreement following upon the Franco-German Treaty on Morocco. After a reshuffling of his Cabinet (March 11) Canalejas adjourned Parliament until May first. During the interval Don Melquiades Alvarez, a moderate republican, launched the Reformist party, aiming at bringing a certain important portion of republican opinion into the fold of the monarchy. The parliamentary session opened with the discussion of the bill called *de Mancomunidades*, ostensibly allowing "diputaciones" (elected provincial councils) to unite into groups for purposes of common administration, but in reality constituting a sop to Catalonia, which under the bill could set up a kind of local Parliament. With the summer a period of strikes, culminating in a grave railway strike, set in. Canalejas met it by applying Article 221 of the Recruiting Law allowing the drafting into military service of all men of military age working in industries of public importance in cases of danger or abnormal circumstances. On Oct. 14 the autumn session began with a fresh discussion of the bill *de Mancomunidades*, but the session was brought to a close by the murder of Canalejas on Nov. 12 1912.

*The Romanones Ministry.*—Count Romanones replaced Canalejas, first in a somewhat temporary, then, after the Franco-Spanish Treaty on Morocco had been signed, in a more permanent capacity, having been confirmed in power by the King. This royal decision contributed to weaken the Liberal party by

strengthening the division between the Romanones and García Prieto groups within it, and led to a sensational protest by Señor Maura, who expected to be called to office. Señor Alvarez, on the other hand, took the opportunity to accentuate his evolution towards the monarchy, helped by the King, who, at the moment, was seeking the advice of several prominent men known for their advanced views. Count Romanones took a good share of whatever merit there was in this policy, as well as in the success of the King's official visit to Paris on the conclusion of the Franco-Spanish Treaty (May 6-9). He resigned on May 31, after a strong speech of opposition from Maura who restated his position of "implacable hostility" to a policy of co-operation with the parties of the anti-dynastic Left. The next day the King asked him to return once more, after the crisis caused by a split in the Liberal party on the question of the bill *de Mancomunidades* then before the Senate (June 11). Count Romanones was reinstated by the King, but this time it was generally realised that this step was simply an expedient necessitated by the coming visit of M. Poincaré to Madrid. M. Poincaré, President of the French Republic, arrived in Madrid on Oct. 7. He left Spain by way of Cartagena, where he embarked on the battleship "Diderot," Spain being represented by the battleship "España" and England by H.M.S. "Inflexible." Both the King and the President emphasised the fact that Cartagena had, six years earlier, witnessed the Franco-Anglo-Spanish agreement on Mediterranean policy.

The latent Liberal crisis broke out as soon as M. Poincaré left Spanish soil: On Oct. 25 the Cabinet resigned, and the King, after attempting in vain to reconcile the parties, realised that the Liberal policy which he had constantly followed since 1909 was at an end. He first summoned Maura but found his views on policy so dangerous that he turned to Señor Dato (Oct. 27), a choice which initiated the disintegration of the Conservative party. The new Government granted a decree giving validity of law to the bill *de Mancomunidades*, dissolved the Cortes (Dec. 31 1913), and came back after a general election with a sufficient majority in both Houses. It met with considerable opposition owing to several royal decisions which were interpreted as acts of personal power in military matters. But its internal difficulties were soon to be merged into the all-absorbing pre-occupation of the World War.

*The World War.*—The international situation of Spain at the outbreak of war was defined by two sets of circumstances: official, and national or popular. The official situation was ruled by the Cartagena Agreement of 1907, confirmed by the conversations held there in 1913 between M. Poincaré and Count Romanones. These agreements and conversations stipulated that "should new circumstances arise tending to alter the territorial *status quo*" in the Mediterranean or in the European and African coasts of the Atlantic, the three powers concerned (Spain, France and England) would "enter into communication" in order to take any measures that might be necessary. The War was obviously a "circumstance" falling within the limits of the above definition. Yet Spain did not "enter into communication" with France and England; for the two Powers most interested in the matter, France and England, made no sign to set in motion the Cartagena Agreements. Señor Dato promptly declared for an absolute neutrality; Spain was, in fact, the only European nation which had no stake in the War. On the other hand, the nation was divided as to its feelings. The working classes, most of the intellectuals and the trading communities, were pro-Ally. The clergy, most of the army and of the bureaucracy and the "idle rich," were pro-German. Thus, the country was split into a reactionary or conservative pro-German wing and a democratic or "advanced" pro-Ally wing, and, as this division was real, and not fictitious as were the party groups, it cut across the parties. On one definite point everybody agreed: Spain was to keep out of the War.

A "committee of initiative" was created for the study and co-ordination of efforts to deal with War problems. Parliament resumed its sittings on Oct. 30 1914 and unanimously endorsed the foreign policy of the Government. The country was meanwhile

getting used to abnormal conditions. Metals, raw and manufactured, clothes and boots, all kinds of foodstuffs, horses and mules, poured into France, under the "neutral" eye of the Government. The Government introduced and passed a bill which gave them special powers to deal with customs tariffs, railway rates, state purchases of food, shipping and expropriation of foodstuffs. The great increase in exports contributed to the rise in the value of the peseta, which gave the Government an opportunity to repatriate the public debt, by enacting that all Spanish Government stock held by foreigners which was payable in francs or sterling should become payable in pesetas in the Spanish market. Though the Cortes was closed, great political activity was displayed by all parties, stimulated by an active German propaganda, soon to be imitated by similar endeavours on the part of the Allies. But though the excitement produced by several outbursts of partisan feeling did not go very deep, the Government decided to deny all permits for meetings on neutrality and the War.

A crisis was, however, precipitated on the refusal of the business community to co-operate with the Government in the launching of a loan. The main cause of the failure seems to have been a reluctance of business circles to subscribe under conditions which were not considered generous enough for the subscriber. The resignation of the Government (June 22) was quickly followed by a reinstatement of the same Cabinet. The situation of the Treasury was by no means flourishing. At the end of the year revenue remained at 1,202,000,000 pesetas while expenses, not including Government purchases of foodstuffs, rose to 1,556,000,000 pesetas. The Government had to fall back on Treasury Bonds negotiated through the Bank of Spain.

Yet the work of the country was in full swing under the stimulus of war orders. Thus, the shipowners announced to the Government (Aug. 1915) that the premiums granted them by the Shipping Acts as a measure of protection were no longer necessary and would not be cashed. This meant that such premiums were no longer worth the sacrifice which they entailed of the shipowner's liberty to trade as he pleased between foreign ports. Great shipping profits ensued, and torpedoings followed. On Aug. 17 the S.S. "Isidoro" of Bilbao was sunk by a German submarine. On Aug. 20 the S.S. "Peña Castillo" of Santander sank in obscure circumstances.

Several efforts made to reunite the Liberal groups into one party again failed. Count Romanones then prepared a plan of campaign against Señor Dato's Government on the Military Reform Bills which was ultimately successful, and the Government fell on Dec. 6. The crisis ended in the formation of a united Liberal ministry. Count Romanones took the premiership, and in order to counterbalance the effect of his well-known pro-Ally views, assigned the Foreign Office to Señor Villanueva, a notorious pro-German.

In a sense, the inclusion of Señor Urzáiz, the Finance Minister, who, though a Liberal, was a party unto himself, and of Admiral Miranda, a Conservative, initiated the period of mixed ministries, which was about to open as a logical consequence of the gradual weakening of the old parties, and in its turn tended to accelerate the process of their disintegration. Urzáiz came into conflict with his chief, and was dismissed before he had time to resign (Feb. 25). His successor, Señor Alba, with a bill on war profits, aroused the opposition of all the minorities except the socialist. But the Cortes was closed, a general railway strike having suddenly upset all Government plans on July 13. The strike was over one week later, and the autumn session dragged on till Dec. 19. The Government reappeared before the House on Jan. 19, but in the meantime Count Romanones had resigned and accepted office again with the same ministry. This crisis was probably devised by the Prime Minister as a means to recover from the King the moral authority which some thought he had lost at the hands of the pro-German Press, which accused him of drawing great profits as a business man from his foreign policy as a Prime Minister.

Count Romanones wore his neutrality with a difference, and, though the inheritor of Señor Dato's policy, he did little to

conceal his pro-Ally views. By September, 1916, Spain had lost more than 30,000 tons of shipping by torpedoing, and more than 50,000 in circumstances which were, to say the least, obscure. The shipping interests asked for Government help. A period of Government activity set in. On Jan. 31 Germany sent in a note establishing an "absolute blockade" of the Allied coasts. Count Romanones was committed to a policy which implied a firm answer to such a note. He gave it in the note of Feb. 6. But the Prime Minister realised that this firmness meant nothing unless backed with the will to fight if necessary and that public opinion would not follow him so far. He resolved to leave the Government there and then, at the top of the wave of his own policy.

*Committees of Defence.*—Other considerations of home policy were perhaps not altogether without effect on his decision, notably, the first signs of a military conflict, which was fundamentally to alter Spanish politics for years to come. When on April 19 Count Romanones resigned, he took the easiest path. His fall, however, cost him the leadership of his party. The new Ministry, under the premiership of Señor García Prieto, was frankly neutralist, and Germany, rightly interpreting the position, felt freer to intensify her submarine campaign. But the Government had to concentrate on the situation created by the so-called committees of defence. Towards the middle of 1916, a system of infantry committees of defence appeared, which soon evinced a tendency to interfere with the Government in such a manner that, towards the end of the year, Count Romanones, then in office, insisted on their dissolution. General Aguilera, the War Secretary in García Prieto's administration, ordered the leaders to be arrested.

But meanwhile, probably owing to royal hints, a less disciplinary line of action was taken, and the arrested men were released. It was known later that an ultimatum had been placed in the hands of General Marina, Captain General of Barcelona, with a time-limit of 12 hours (June 1). Not unnaturally the Government resigned. Dato, called to office, capitulated before the Juntas, and accepted their regulations in full. This victory of a movement which, in its essence, was revolutionary, had an immense effect on immediate events as well as on the political evolution of the country. The revolutionary ferment was stimulated. Political manifestos asking for a renovation in government and constitution followed each other (Socialists June 12, Catalanists June 16, Left-Coalition June 16). All but three of the deputies and senators for Catalonia met on July 5 at Barcelona, and passed a resolution asking for an immediate meeting of the Cortes, and declaring that, should the Government refuse to comply with this request, a meeting of all the deputies and senators composing the Cortes would be called at Barcelona on July 19. The Government allowed it to be known that should the Assembly meet it would be considered as rebellious and treated as such.

The Assembly met, 13 senators and 55 deputies attending, including all the Socialist, Republican and Reformist members of the Cortes, voted resolutions asking for a reform of the constitution, and set up three commissions to prepare reports on reforms to be submitted to a second meeting to take place later. At one moment it looked as if these 68 men would take the lead of the revolutionary spirit which the bold action of the army officers had stirred in the country. But the mass of the Assembly was too dull, and no real leader manifested himself. Thus two attempts, one military, one middle-class, both directed against the evils of the old régime, failed through lack of co-ordination and mutual understanding. A third attempt, and a third failure, was still to come. On Aug. 10 the railwaymen of the Northern Railway went on strike. On the 13th, a general strike, clearly revolutionary, was suddenly launched in the whole country.

The country was declared in a state of war, and the military crushed the rebellion with a ruthless hand. By Aug. 19 the situation was well in hand. The net result was to prove that the only real force in the country was the army committee system. On Aug. 10, the Council of Ministers passed a special credit for military expenses. The committee, conscious of their strength, asserted themselves in the field of civil politics. The scandal

became public on the Government lifting the censorship. The committees attempted to deliver a message into the hands of the King. Dato had to resign on a "perfectly constitutional" hint by the King. In point of fact he was expelled by the army committees. The crisis was long and laborious, and in the midst of it, the Parliamentary Assembly met in Madrid (Oct. 30) in its second session. The Cabinet was at last formed by García Prieto. It was a Coalition ministry composed of Maurists, Liberals, and Catalanists, in which, in order to give satisfaction to the new demand for an impartial general election, a non-political judge was given the post of Home Secretary. Señor La Cierva, who took the War Office, was the real head of the Cabinet. His policy consisted of ingratiating himself with the committees of defence, so as to become their leader and representative.

Juntas were soon formed by the civil servants of nearly all Government departments, and on Jan. 12 1918, on the occasion of a difference between the Postmaster-General and his subordinates, an agitation began which was ultimately to cause the downfall of the Government. On Feb. 21 the telegraph officials went on strike—by meticulously carrying out official regulations.

On Feb. 24 the general election took place under these abnormal conditions. For the first time a Coalition Government presided over an election, and great hopes were entertained as to the result. The new Chamber, however, was but an average of the preceding ones, different only in that no party in it had a clear majority. La Cierva began then to act as the self-appointed leader of the committees. After provoking two partial crises, he committed the Government to a policy as firm towards the civil Juntas as it was weak with the military ones. On Feb. 17 the postal services declared a strike. La Cierva's efforts to cope with this by means of military improvisations ended in utter failure and the Government fell, March 18. All possible combinations were tried and failed, until on March 21 at midnight, at a meeting of ex-prime ministers called by the King in his study, after, it is said, having threatened his abdication, King Alfonso succeeded in forming a "ministry of all the talents."

This Government had agreed on a concrete programme: reform of the standing rules of the Cortes, amnesty, military reforms, budget. The Government carried them all but the fourth, Alba having left the Cabinet on their refusal to pass his education plans (Oct. 8), which ultimately brought the Cabinet to its end on Nov. 6. The new Government, presided over by García Prieto, had to be formed amid the sensation caused by the arrival in Madrid of the news of the Kaiser's flight. The world being full of the idea that the triumph of the Allies meant that of democracy, the Government published an "advanced" manifesto, but the ministry fell on Dec. 3 1918, and Count Romanones formed a stop-gap Cabinet so as to pass the budget and leave the King free for a change of policy. The first important act of Count Romanones was his visit to President Wilson, then in Paris.

It is to the credit of the successive Governments which ruled Spain during this period that they succeeded in steering clear of all obstacles, home and foreign, overburdened as they were with home problems and foreign advice not always disinterested. On June 20 1917, a German submarine "UC52" arrived in Cadiz for repairs. Dato allowed its arrival and departure within 24 hours, and thereupon had a royal decree signed forbidding submarine navigation in Spanish waters. The next incident of the kind was the escape of the "U53," which had been interned in Cadiz under the above royal decree. On the initiative of the Romanones administration a treaty had been negotiated in London between the Marqués de Cortina and the English Government. This agreement was signed on Dec. 6. Its importance lay in the fact that it legalised in the eyes of the pro-Germans all trade with England, which received food and ore in exchange for coal. Torpedoings continued all the same, and the Spanish Government decided to apply to Germany the claim of ton for ton. Germany had agreed to the ton-for-ton indemnity when the end of the War came. The Spanish merchant marine had lost 65 ships representing 140,000 tons. From the material point of view, the neutral attitude adopted by Spain contributed to

accelerate the progress which was observable in her economic development in the pre-War years. This period of exceptional activity comprises two coincident movements. One is a somewhat artificial "inflation" of Spanish industries, due to the demand of the Allies. The other one is the continuation of a development already noticeable before the War. Thus certain industries, really national, such as that of olive oil, succeeded at last in establishing themselves in foreign markets.

*Troubles in Barcelona.*—Count Romanones did not precisely find in Paris in 1919 the diplomatic triumph which he had expected, but neither did he return wholly disappointed. He found the country astir with a mixture of two political currents, one a democratic, constitutional agitation, born of the Allied victory, another one a revolutionary agitation which could be traced to the unwholesome effect of the Juntas' *pronunciamientos*. The main effect of these two movements was felt in Barcelona and was represented by Catalanist propaganda, a military undercurrent of opposition to it, and lastly syndicalist agitation which made the two former forget their mutual enmity and unite against it. A violent conflict arose between the military and the civil authorities of Barcelona on the occasion of a strike, and when the strike had been settled by the latter, the Government suddenly resigned. It was known afterwards that this resignation was due to the military having expelled the civil authorities from the town. Maura took office on April 15, asked for a decree dissolving the Cortes, and to the consternation of all parties, obtained it. This amounted almost to a *coup d'état* on the part of the King.

After a general election held under a strict censorship, under the protest of all the Left parties (including the Monarchical Liberals), and with the use of electioneering methods which had been long forgotten in Spain, Maura failed to bring to the new Cortes more than about one-eighth of its total membership under his banner. His Government fell under a discussion of his electioneering methods (July 20), and Señor Sanchez de Toca (Dato being ill) formed a Conservative Cabinet, which had to deal with a grave situation in Barcelona, where syndicalist trouble was again brewing. But a new outburst of the Juntas forced the Government to resign, and Señor Allendesalazar (a follower of Maura) took office with a Coalition Cabinet. The change of policy which the change of Cabinet implied aggravated the conflict. Murders continued. A mutiny organised by syndicalist soldiers took place in a barracks in Saragossa. Disorders broke out in Valencia and Santander. Another militarist outburst ended the life of the Cabinet, which, having passed the budget, left office on March 4 1920. The King called Dato to power. But the general election at the end of 1920 showed that the mainspring of the old system—i.e., the docility of the electorate to any kind of government—could no longer be counted upon. Dato failed to obtain a working majority, his supporters numbering 177 members out of 405. All his efforts were accordingly bent towards the reconciliation of the several factions within the Conservative party. While engaged in this task he was assassinated by anarchists on March 8 1921.

*Decay of the Party System.*—This murder accelerated the disintegration of the system of rotation of the two political parties, which, as arranged by Cánovas and Sagasta at the death of Alfonso XII (Pacto del Pardo), had stood the monarchy in good stead as a substitute for a real constitutional practice on the lines of the English Monarchy. The lack of an objective policy, or even of objective principles, which had all along been a cause of weakness in the two political parties of the Restoration and the Regency, became more and more apparent as death, whether by natural or by criminal means, thinned out the ranks of the leaders and delivered the parties to the intrigues of understudies and second-rate politicians. While the old system deteriorated day by day owing to its own internal weakness, the forces which attacked it from the outside gradually gained strength.

These forces were of three different kinds: first, the anti-dynastic elements, once heaped together under the common name of Republicans, now moving towards Socialism on the one

hand and on the other towards different varieties of social revolutionaries such as syndicalists, anarchists and, even professional agitators without any particular political or philosophic bias; secondly, the Catalan homerulers, gradually evolving from autonomy to separatism; finally the movement of what might be called *military syndicalism* embodied in the famous *juntas de defensa*, to the intervention of which in active politics many of the political crises of the period have been due. The death of Dato (March 8 1921) was to reveal the interplay of these forces. The Conservative party found itself suddenly deprived of its chief. The King called on Maura, who made it clear from the outset that he would constitute a national coalition or no Government at all and, finding no support in the Liberal party, had to withdraw from the field. A purely Conservative Government took office under the leadership of Allendesalazar, during whose administration some of the symptoms of the crisis through which the very constitution of the country was soon to pass, began to appear on the political horizon. Thus in a famous speech delivered on the occasion of a banquet in Córdoba, May 23 1921, the King referred to the working of the Spanish Parliament in terms of scathing criticism.

*The Melilla Withdrawal.*—The greatest event of the year was the military disaster which the Spanish troops met in Morocco in July 1921. It entailed the following immediate effects: the withdrawal of the Spanish troops from all the zone previously occupied by the commanding-officer in Melilla; the death of the commanding-officer in Melilla, General Silvestre, a brilliant cavalry officer, who committed suicide at the beginning of the precipitate withdrawal of the Spanish troops effected in most painful conditions at heavy cost of men and material; and finally considerable moral effects both in Spain and in the Rif—in Spain because from that moment onwards the Moroccan problem became the very centre of national politics; in the Rif because the collapse of the Spanish troops in Anoual raised the prestige of Abdel-Krim. The country was suddenly brought to compare these results with the cost of the army which, after the reorganisation effected in 1918, rose to a figure of about 700,000,000 pesetas yearly.

The emotion due to these events swept away the inadequate Government of Allendesalazar. A stronger Conservative Government was constituted under Maura who was enabled, by a public opinion strongly roused by the situation in Morocco, to send to the rescue of the troops there an army of 140,000 men. But at the same time an energetic demand for an inquiry which would ruthlessly bring out the responsibilities for the disaster made itself heard. As a set-off against this current of civilian opinion, the *juntas de defensa* began a campaign of threats and accusations against Parliament, which they considered responsible for the general disorganisation leading to the Moroccan crisis. The gradual revelation of the magnitude of the defeat; the growing number of details published concerning the disorganisation of the auxiliary services in the Moroccan Army, and particularly those of health and commissariat; the inopportune proposals of the War Minister, La Cierva, who, in Nov. 1921, before any adequate inquiry as to the responsibility for the disaster had been decided upon, submitted to Parliament a bill for military rewards; the warm and public welcome given by the King and his Government to General Berenguer, who was commander-in-chief of the military forces in Morocco at the time of the Anual disaster, before any authoritative pronouncement had been made as to the extent of his responsibility in the matter; these and other factors of a similar kind so strengthened the demand for an inquiry that the Government decided to appoint General Picasso as an official investigator to report to the Government on the operations and the responsibility for them. General Picasso carried out his task with a high sense of duty and impartiality, and his report was received by all parties alike as a fine example of patriotic courage.

But this display of energy on the part of the Government increased the opposition of the military *juntas de defensa*. The Cabinet sought a clumsy solution of this problem by a so-called "disbandment" of the *juntas* and their replacement by *juntas*

*informativas* publicly and legally recognised and placed, at least in theory, under the authority of the War Minister. This solution satisfied nobody. Parliamentary opinion did not fail to see its purely superficial character, while the officers themselves, though in no way deprived of their organised power, resented the humiliation imposed on them by the new measures. The Maura Cabinet resigned on a conflict with them in Jan. 1922, and though it continued in office by express wish of the King, had finally to disappear in the month of March of the same year, leaving office to another Conservative Cabinet under the leadership of Señor Sánchez Guerra.

*The Juntas.*—The new Prime Minister was known to be an energetic man, strongly opposed to any undue interference of the military in political matters, but he took office at a time when Parliament was exceedingly weak. This fact was not without influence in the movement towards a federation of all the groups into which the Liberal party had split up since the death of Sagasta. In April 1922, these Liberal groups came to an agreement, not only among themselves, but also with the small but influential Reformist group, headed by Alvarez. Meanwhile, the *juntas de defensa* of the infantry officers, authorised by the previous War Minister, met in an assembly which adopted a number of resolutions, two of which may be given here as an indication of their general attitude: (1) Every infantry officer to be bound to affiliate to the *juntas*, or otherwise to be prosecuted before a tribunal of his brother officers; (2) No promotion to be authorised in the army save by seniority.

It became more and more apparent that in the *juntas*, the army officers had set up a form of military syndicalism which, owing to the material strength that it wielded, was a state within the State. The parliamentary debates on Morocco became more and more searching on the publication of the figures relating to the expenses during the fiscal year 1921-2 amounting to 519,681,839 pesetas as against 173,190,000 in 1920-1. Simultaneously with this revelation, the news of a considerable defalcation in the offices of the commissariat in Larache was made public, while Parliament had at the same time to deal with a deficit in the budget amounting to 1,101 millions. All these facts contributed to give substance to the demand for bringing home political responsibility which up to the moment had met with the obstacles imposed by the traditional co-operation and comradeship prevailing between the two main political parties since the Pact of el Pardo. The report that had been prepared by Picasso was submitted to a parliamentary commission on which all the Parties were represented. The long-drawn debates of this commission led to three different draft reports, and this lack of unanimity increased the difficulties in which Sánchez Guerra's Cabinet was at the time entangled. The Prime Minister had courageously applied to the situation which he found on taking office methods borrowed from the policy of his Liberal opponents. Thus he restored the constitutional guarantees which had been in suspense for over two years and he recalled from the civil governorship of Barcelona General Martínez Anido who had established a certain amount of order in that unhappy city but by methods which had aroused considerable criticism. Sánchez Guerra was also responsible for a decree dissolving the military *juntas*, and prohibiting officers of the army from entering any association whatsoever connected with their profession.

The parliamentary debates on the three reports submitted by the commission on responsibility gradually warmed the political temperature of the Congress of Deputies to such a pitch that men of a conservative turn of mind like Señores Maura and Cambó rose to indict the political system in general and (in the case of Cambó) the Cabinet in office in July 1921. Public opinion outside followed with intense interest the proceedings of Parliament. The more popular part of the campaign was led by the Ateneo de Madrid, an intellectual club which has always played an important part in the literary, artistic and political leadership of the country. But the debate in Parliament degenerated towards its close into a political fight of such violence that the government collapsed and Parliament was dissolved.

*Liberals and Morocco.*—The Liberal coalition which had been created in April of the same year then took office (Dec. 1922); in its official declaration to Parliament the new government made it clear that it would uphold the parliamentary procedure adopted in regard to the conduct of the Moroccan campaign. Popular feeling did not lag behind and promptly backed this attitude of the new government. A popular procession organised by the Ateneo de Madrid showed the enormous hold that this question had obtained on the people. Señor Lerroux, a well-known Republican leader, in a speech delivered in Seville, in Jan. 1923, went even so far as to involve the King in part of the responsibility for the disaster and a Conservative paper *La Accion*, published in Feb. of the same year a sensational article in which it advised the King to give up all idea of abdication, an intention which, according to this newspaper, the King had more than once expressed in private conversation. *La Accion* took this opportunity of pointing an accusing finger at certain politicians in order to screen the King, and thus the estrangement between the King and the political circle of collaborators who had stood him in good stead from the beginning of his political life, and even from the beginning of his life (for King Alfonso was born a King), began to show itself in the Press.

The new government had to face a crisis on their proposal for the amendment of Article 11 of the Constitution dealing with the toleration accorded to other religions than that of the Roman Catholic Church. The clergy protested, and the government, having withdrawn the proposal, the Minister of Finance, Señor Pedregal, who represented the Reformist group in the Cabinet, left the Ministry, though the Reformist group, realising that the Liberal party had in any case an uphill road before them, continued to give their active help to the administration. The elections held in April 1923, led to a Liberal-Reformist majority, but its sensational feature was the success of five out of eight Socialist candidates in securing election in the capital, attributed by the Socialist party to the strong line which they had taken against the war in Morocco and in favour of a searching inquiry.

After the opening of Parliament the high court for the war and the navy (*Tribunal Supremo de Guerra y Marina*) demanded from the Senate authority to prosecute General Berenguer, ex-high commissioner and commander-in-chief in Morocco, who, as a senator, could not be prosecuted until the Senate withdrew from him his parliamentary immunity. Generals began to appear in the forefront of politics, foreshadowing what was to come. A notorious personal incident, involving General Aguilera, President of the Supreme Military Court, Sánchez Guerra and another ex-Prime Minister and ex-president of the Senate, Señor Sánchez Toca, was the herald of the coming political storm. The difficulties arising out of this phase of the Moroccan question, were considerably increased by other events in the same field. During the summer of 1923 the Liberal Govt. had endeavoured to strengthen civilian and to reduce military action in Morocco. From 1909, when military action was started on a large scale, until 1923, Morocco had consumed more than 2,500,000,000 pesetas and the yearly figures showed a definite tendency to increase; thus the average yearly expense had been from 1909 to 1913 75,000,000, from 1914 to 1918 146,000,000 and from 1919 to 1923 358,000,000 pesetas. The outlook was therefore black for Spanish finance, particularly as the budget for the year 1922-3 showed a net deficit of 920,000,000 and a total of actual expenses estimated at 3,373,000,000. The increase in military and naval expenditure for the period 1915 to 1922-3 had been 167%, while the net revenue of the State had only increased about 100%.

The burden which the Moroccan question imposed on the Treasury was aggravated by other problems which the nation was unable to put aside. The railways were face to face with a severe crisis due to a variety of reasons, industrial and financial. A system of recoverable advances to the companies established in 1920 had resulted in the shifting of part of the financial burden of the railways from the private companies to the State. In three years the Treasury had handed over 173,000,000 to the

companies. Moreover, in April 1920, confronted by a dangerous conflict between the owners and the men, the government had consented to meet any additional expense caused by increases in the wages of all railway servants. As a result of this decree of April 1920, the Treasury had to disburse from the said date until Sept. 13 1923, a sum of 328,000,000 pesetas. The economic situation had somewhat improved since 1920-1, when the tension between owners and men was at its highest, particularly in Catalonia, where professional agitators victimised both owners and men to such an extent that in the year 1921 there were in Catalonia alone 145 attempts on human life causing 90 deaths.

In Sept., 1923, the debates of the parliamentary commission on the disaster of 1921 were drawing to a close and the commission was ready to draft its findings and submit them to Parliament. Several well-known politicians were stated to be deeply involved either for lack of foresight or because they had allowed too much freedom to the military or—and this was perhaps the most dangerous element in the situation—because they had accorded too much unconstitutional initiative to the King. Other difficulties, no less grave, were raised owing to the ill-feeling with which the army received any parliamentary or civilian criticism of its action in Morocco. While the nation was anxiously wondering what was going to be the next development of this long-drawn conflict, a dramatic stroke brought suddenly to an end the system under which the country had lived since 1875.

*Primo de Rivera.*—The captain-general of Catalonia, Don Miguel Primo de Rivera (Marqués de Estella) rebelled against the government, threatening its members with jail, and seized power first and office afterwards. Don Miguel Primo de Rivera had already once or twice appeared in the limelight owing to declarations on such questions as the giving up of Morocco, on which he held, from the first, courageous if unorthodox views, and on the interchange of Gibraltar and Ceuta. This last expression of opinion had caused his removal from the position of military governor of Cadiz which he then occupied. At the time of the *coup d'état* General Primo de Rivera was captain-general of Catalonia, his headquarters being in Barcelona, where he wielded considerable political influence. There is no doubt that he utilised his office as the jumping-ground for his bold adventure, for his first steps were certainly taken in agreement with, if not with the full concurrence and help of, the conservative homerulers of Catalanian politics.

In the early morning of the 13th, the government published the news that the captain-general of Catalonia had risen in arms against the government, that the government would not leave its post and that the King, who at the moment was in San Sebastian, would arrive in Madrid the same day. The military authorities of Bilbao and Saragossa, it was reported unofficially, had sided with the rebels and in Madrid a council of military commanders of the Madrid garrison were acting for Primo de Rivera. The captain-general of Madrid, General Muñoz Cobos, maintained a cautious, though dubious attitude. A manifesto published the same day by Primo de Rivera declared that it was indispensable to liberate the country "from the professional politicians, the men who, for one reason or another, are responsible for the period of misfortune and corruption which began in 1898 and threatens to bring Spain to a tragic and dishonourable end." The general added that "the wide net of greedy politics has caught in its meshes and imprisoned the royal will itself." He announced the constitution of a military directorate in Madrid which was to find for the problem of Morocco a "quick, dignified and sensible" solution and was to bring home responsibility "promptly and justly" by the formation at an early date of "tribunals of recognised moral authority." He brought accusations of a grave character against the Foreign Secretary, Don Santiago Alba, who had taken a strong stand against military action in Morocco, and announced that Alba would be prosecuted immediately, as well as the Prime Minister himself, Marqués de Alhucemas, for the support he had given to his Foreign Secretary.

Immediately after the King's arrival (delayed 24 hours) the

Prime Minister called on His Majesty and proposed strong action against the military rebels, but the King asked for time for reflection and the government resigned. Two hours later a deputation of generals was received at the Palace and, as a result of this visit, the King requested Primo de Rivera, still in Barcelona, to take office, while accepting the authority of the military directorate which had been previously constituted by him. Upon his arrival in Madrid on Sept. 15, Primo de Rivera proceeded to transform the military directorate both in its personnel and in its constitution. The first directorate was confined to the military commanders in Madrid; the one founded by the General represented all the branches and all the garrisons of the army: it contained a brigadier-general from each military district belonging each to a different branch of the service and a representative of the navy, in the person of Admiral Marqués de Magaz, a member of the permanent advisory commission on military, naval and air questions of the League of Nations.

From a constitutional and administrative point of view, the directorate struck an original note. The only Minister was Primo de Rivera himself. As a whole, the directorate was the equivalent of the Council of Ministers, but the directors were not Cabinet Ministers. The various ministerial departments were entrusted to the care of under-secretaries, but final decisions were always taken by the directorate as a whole, after a special report had been received from one of the directors, not necessarily always the same for the same department. The under-secretaries in charge were in some cases genuine permanent officials, in other cases minor political or semi-political figures eager for advancement. The Home Office was entrusted to General Martínez Anido. Public opinion received the change in absolute silence, save for a protest from the Socialist party. The other political parties remained silent, except the followers of Maura who, without the approval of their chief, declared in favour of the new administration because "the Crown had accepted it and the unmistakable majority of the country was behind it."

*The Directorate's Policy.*—Meanwhile the directorate began to assert itself. It declared the country in a state of war. The Press was put under a strict censorship and all public demonstrations of a political character were forbidden. A government manifesto was addressed to the working-classes foreshadowing, if necessary, the enforcement of compulsory laws in order to fix the hours of work and rate of wages. All provincial governors were dismissed and their authority handed over to the military. The municipalities, which were considered by the new administration as nests of political corruption which the directorate had come to destroy, were the object of systematic scrutiny. No fewer than 115 municipalities were thus closely inspected by the military, who failed however to bring forth proof of any substantial local corruption. Nevertheless, the directorate replaced most of the municipalities of the country by a new personnel chosen amongst local people who happened to be trusted by the military delegates, and appointed officers to take supreme control over local politics and administration. Military men were also appointed to a considerable number of high public offices. In order to forestall possible trouble in the lower ranks of the army, a substantial rise in pay was granted to non-commissioned officers. A heavy budget for public works, amounting to 54,000,000 pesetas, was set aside for Morocco.

On Nov. 13, two months after the *coup d'état*, Count Romanones and Don Melquiades Alvarez, the presidents respectively of the Senate and of the Congress of Deputies, called on the King in order to remind him that the Crown was under a personal constitutional obligation to call the Cortes together within three months of their dissolution. The two presidents drew the attention of the King to the fact that this article of the constitution had always been scrupulously respected during the 47 years it had been in force. The King referred the matter to the directorate, and an official note from the Government was published to the effect that these two statesmen who were deprived of their posts and privileges were the representatives of a decaying parliamentary system and their visit an ingenious move in favour of a political régime which had passed away.

The King and his Premier went on an official visit to the Court of Italy in Nov. 1923. Three sets of facts must be recorded in connection with this visit. First, the public and private expressions of approval from the King and from Primo de Rivera for the success and methods of Fascismo. Thus the King declared to General Italo Balbo: "I admire Fascismo. You are happy here in being so near the end of your labours. We are just beginning." Then the political activity of the King and his Premier in regard to the Vatican. The King read a sensational speech in the presence of the Pope which met with considerable criticism, not only in Vatican circles but also in Spain and South America. Spain was offered to His Holiness in the event of a new crusade being necessary. The answer of the Pope was a discreet, broad-minded pronouncement. Finally, it was widely believed that as a result of this visit a definite political programme of international co-operation between the two Mediterranean peninsulas was being prepared, a view belied by subsequent events. The next important step in the foreign policy of the directorate was the signature of the Tangier Convention in Dec. 1923. This Convention, which was severely criticised in the country, excluded Tangier from the Spanish Zone, establishing for it an international régime. Public opinion in Spain on the other hand had always considered that the alternatives for Spain in Morocco were either giving up the whole adventure or else remaining in Morocco with Tangier as the basis for action. In spite of the strict censorship, the hostility of public opinion became clear and the directorate took great pains to explain away the awkward fact that, although the country was at the moment governed by a strong dictatorship, its strength could not reach beyond the frontiers and indeed seemed in the international sphere to be weaker than the old system which it had replaced.

*Home Affairs.*—In home politics the government continued to repress all hostile expression of opinion. The agitation for an inquiry into the Moroccan campaign remained active and had for its centre the Ateneo de Madrid. The directorate, after having vainly attempted to obtain from the Ateneo its consent to a curtailment of its liberty of speech, closed the club—the first time since its creation in the second half of the 19th century. Don Miguel de Unamuno (*q.v.*), the famous author and professor of Salamanca University, whose strong stand against the directorate, expressed in indignant and sometimes offensive articles in the Press of South America had greatly incensed the directorate, was exiled to the Canary Islands.

Though the activities of the government were mainly concentrated on Morocco it did not, however, neglect internal matters. Thus in March 1924, the council of national economy was created in order to co-ordinate the activities of numerous economic organisations working under several departments. The council of national economy was divided into six sections: tariffs, valuation of goods for tariff purposes, statistics, commercial information, defence of production, treaties of commerce. The directorate freed itself from any legal restrictions in the matter of accountancy and financial administration and its decrees had the full force of law. It found a treasury heavily burdened with military and Moroccan expenditure and a budget with a regular deficit. In April 1924, it floated an internal loan of 700,000,000 pesetas of four-year-term bonds at 5% and 1% sinking-fund, in order to meet the Treasury Bonds issued by them in Oct. 1923. This loan was covered nearly eight times over. Further in 1923 the directorate organised a national railway council in order to regulate and co-ordinate the administration of the railway companies, the State and the companies sharing in the administration and the State participating in the financial liabilities and assets of the companies. As a result of this step the government launched a railway loan (Oct. 1925) to the amount of 300,000,000 pesetas at 5% free from tax. This loan had but a moderate success in contrast with the success of the loan of Treasury Bonds made in Nov. 1924, mainly owing to the fact that the economic crisis through which the country was passing, due among other reasons to excessive protection and continual deficits, had become graver.

Elated by the success of the loan floated in Nov. 1924, the directorate then began to consider the possibility of perpetuating their régime by the creation of a political party outside the framework of the old ones which they christened the "Patriotic Union Party," while refusing to other political organisations the right to address public meetings. In the old City of Medina del Campo representatives of many civilian municipalities met the president of the directorate and asked him for tariff protection and agricultural credits. A similar movement aiming very much at the same ends, was active in Andalusia, supported largely by the great land-owners anxious to obtain some betterment of the financial and economic conditions of agriculture, but oblivious of what is perhaps the most important factor in the agricultural situation of Spain, namely the conditions under which land is held by the small land-owner and cultivated by the labourer.

*New Phase in Morocco.*—The problem of Morocco, however, soon monopolised the attention of the president. The expenses continued to increase. The Budget of 1923-4 had to face a deficit of 576,000,000 pesetas, compared with a deficit of 920,000,000 in the budget of 1922-3, and of 1,101,000,000 for 1921-2. The decrease in the deficit in 1923-4 was not due to a reduction in expenses, but to a considerable increase in receipts due to the rise in the assessment of the tax on *utilidades* (a kind of tax on incomes) and to a better assessment of local and urban taxable property. As for the year 1924-5, while financial papers estimate the deficit at 1,000,000,000, the directorate declares that it does not go beyond 600,000,000. There is no doubt, however, that the figures show a considerable and continuous increase in the military and Moroccan expenses of the country. General Primo de Rivera tackled the problem of Morocco with characteristic courage. In the summer of 1924 he decided to carry out what had always been his plan, namely, a considerable withdrawal and a curtailment of military liabilities. Two obstacles lay across his path. The first was that in taking this decision he was but following in the wake of the Foreign Secretary whom he had violently expelled from power, since the policy of an agreement with the Rifian leaders and of withdrawal from the more inaccessible parts of the Spanish zone, as well as the transformation of a military occupation into a civil administration, had all along been advocated by Alba.

The second obstacle was that the Spanish Army in Morocco did not consider that it had sufficiently avenged the disaster of Anual, and would not hear of any proposals for withdrawal. In the face of these two obstacles, Primo de Rivera resolved to carry out his policy and he deserves all credit for having succeeded first, in imposing his views on the Spanish Army in the field at the risk, not only of his popularity, but even sometimes of his life, and also for having most skillfully conducted a difficult military retreat covering all the zone between Tetuan and Xauen. Later events, however, obliged General Primo de Rivera considerably to modify his policy in Morocco. In the summer of 1925 a sudden attack launched by Abdel-Krim against the French forces in the French Protectorate, led to the combined action of the two countries interested in Morocco. The French Govt. sent to Spain M. Malvy, who negotiated with General Primo de Rivera an agreement for military and political co-operation which led to the recovery of the French territory lost during the first onslaught of the Rifian troops, and to the occupation of Abdel-Krim's headquarters, after a brilliant landing in Alhucemas Bay by the Spanish troops. (For later developments see Morocco.)

From the political point of view, this episode in the Moroccan War may be considered as one of the many instances of Spanish co-operation in international politics with France and England. Since the War the foreign policy of the Spanish Govt. has followed the lines of this co-operation. The first neutral State to join the League of Nations, Spain has occupied since an elective seat in the Council and, partly owing to its neutrality in Europe, and partly owing to the ability of its representative in the Council, Señor Quiñones de León, has often played in the League the rôle of "honest broker" in questions in which there was a difference of opinion between the Great Powers. This was

so in the question of Upper Silesia, in the case known as the "Corfu case," and in others of smaller importance.

**Municipal Reform.**—During 1925 the directorate embarked on a thorough-going reorganisation of the provincial and municipal administration of the country. The government promulgated two decrees. The first deals with municipal reform and aims at establishing a system of municipal autonomy, delegating to municipalities the right to levy certain rates, thus enabling them to set up their municipal treasuries; and establishing female and proportional suffrage in municipal stations. A similar decree has been promulgated concerning provincial administration, the most important effect of which was the abolition of the *Man-comunidad*, a kind of Catalan local parliament. In its Catalan policy the directorate soon reversed the pro-home rule orientation which had inspired the first utterances of Primo de Rivera. The Conservative home-rule elements of Catalonia, in supporting the first steps of Primo de Rivera, had undoubtedly hoped that the president of the directorate would facilitate a policy of devolution. He, however, found considerable opposition to such a course amongst the military forces which surrounded him for, gradually, the sympathies of the directorate towards the Catalan autonomist movement disappeared and made way for a régime which was described in Catalonia itself as one of systematic persecution.

The country owes to the directorate a fuller measure of internal peace than it had enjoyed under the old system, and this fact certainly helps to facilitate its task. Nevertheless the military government, though with the best intentions, is inflicting on the country grave harm in depriving it for such a long time of the normal channels for the expression of public opinion. With the Press gagged, and political leaders of the country deprived of their right to address the public, public opinion cannot exist, let alone express itself. Rumours are astir all over the country, as is always the case when news is controlled by official means. Local risings such as that of Vera in 1924 which, though a purely local affray between civil guards and obscure men, ended in the execution of three misguided individuals, and widely spread military conspiracies such as that discovered in Nov. 1925, which led to the imprisonment of several generals in Madrid and of a few professors in Barcelona, revealed an unhealthy state of affairs. Though the president of the directorate often describes the system for which he is responsible as the first phase in a new order of things, it would be more accurate perhaps to describe it as the last phase of the old order.

Nor is this observation in any way weakened by the choice of his collaborators in the recent transformation of the directorate into a Ministry or Cabinet. On Dec. 3, Primo de Rivera parted from his military team and formed a Ministry of which, apart from himself and the Ministers of War and Marine, a fourth soldier was a member in the person of Martinez Anido, who became Home Secretary and vice-president of the council. The other Members of the Cabinet were for the most part young and unknown men drawn from the extreme right of the old party system. Primo de Rivera, in becoming president of the council, made it perfectly clear that he meant to retain full powers as dictator, and he emphasised, in particular, that the Press should remain under the same system of strict censorship. During 1926 the censorship, both of the press and of persons, was vigorously used, especially in Catalonia, one eminent professor being exiled.

It seems obvious that the country must pass through more dangerous waters before coming to calm seas again. But, one of the hopeful signs is the calmness and apparent indifference with which Spain is accepting its present trials, for it shows that the nation, after a long period of agitation, has at last come to realise that political progress is a matter of silent and daily work rather than of dramatic action and violent enterprise.

**BIBLIOGRAPHY.**—*El Año Político*, published yearly by Fernando Soldevilla; Count Romanones, *El Ejército y la Política* (1921); F. de Leon y Castillo, *Mis Tiempos* (1921); Count Romanones, *Las Responsabilidades del Antiguo Regimen* (1924); Francisco Cambó, *En Torno del Fascismo Italiano* (1925); G. Maura Gamazo, *Historia Crítica del Reinado de Don Alfonso XIII.* (1925). (S. DE M.)

## II. EDUCATION

From the beginning of the 20th century there has been marked educational activity in all parts of Spain. A large number of students and teachers are sent abroad to study every year, and they constitute a reserve from whom teachers and research-workers are being recruited. With the help of the "Committee for the Extension of Scientific Study and Research" (an autonomous but official body), departments for the study of mathematics, biology, physics, chemistry, botany, philosophy, philology, history, archaeology, palaeontology and law are being founded. The same committee was responsible for the founding of the *Instituto-Escuela* in 1917—an establishment for secondary education which, attended by hundreds of girls, is rapidly transforming old educational methods, particularly as it exercises considerable influence over other secondary education centres.

Primary education is also improving in respect of the numbers, salaries and training of teachers. The number of teachers in 1917 was 26,253; in 1920, 28,202; in 1924, 30,180; and in 1925, 31,180. Illiteracy is decreasing, but only slowly, owing to the lack of sufficient schools and the number of poor families who are compelled to send their children of school age out to work. The statistics for illiteracy, which is of course most marked in the rural centres, are as follows:—in 1887, 68.01%; in 1900, 63.78%; in 1910, 59.35%, and in 1920, 52.23%.

The *Junta de pensiones para Ingenieros y Obreros* gives assistance for technical and professional training and sends the most suitable engineers and the most intelligent and industrious workmen, including those who are engaged in agriculture and its subsidiary industries, to the best industrial centres for purposes of study and training. The 11 existing universities have, according to the last complete census, that of 1923, 25,690 students, recording a steady increase since 1914-5, when the number was 20,497. The normal schools for male teachers, numbering 42, have passed through a critical period owing to the poor pay of the teachers, but since the increase in their commencing salaries—3,000 pesetas and residence—in 1923, the number of entries has increased, exceeding 5,700 in 1922, and 7,000 in 1925. The 48 normal schools for women teachers had 12,100 pupils in 1922, and over 14,000 in 1925. All these schools are recruited from all classes of the community, and a considerable number of the pupils come from good upper-middle-class families. Secondary education also has its difficulties, and as the 60 existing *institutos* or state secondary schools are unable to provide for more than 32 to 35% of the scholars available (54,602 in the last census), many have to take their educational courses in private schools.

The 37 schools of art and industry, which teach some 40,000 pupils, are unable to absorb the large number of applicants from the working classes. There are 23 commercial schools, two schools for the training of industrial engineers and one each for the following:—mines, forests, roads, canals and ports, and agriculture. It is interesting to note that there is a revival in the study of the old Spanish industrial arts—ironwork, artistic textiles, leatherwork, embroideries, lace, carpets, ceramics, etc.

## III. ECONOMIC HISTORY

**Population.**—According to the census of 1910 the population of Spain was 19,995,686. By 1920 it had grown to 21,389,842, and according to an estimate of 1925 it was 21,966,000.

The principal centres of population are:—

| Inhabitants |         | Inhabitants |         |
|-------------|---------|-------------|---------|
| Madrid      | 750,896 | Barcelona   | 710,335 |
| Valencia    | 251,258 | Seville     | 205,529 |
| Malaga      | 150,584 | Saragossa   | 141,350 |
| Murcia      | 141,175 | Granada     | 103,368 |

These are the only cities whose population exceeds 100,000. The population of the large towns is increasing, and whereas in 1900 to 1910 the provincial capitals accounted for 16% of the total population of the peninsula, in 1920 this percentage had increased to 18.8 and it was calculated that in 1925 it would have approximated to 20%. The population is most dense in the province of Biscay, with 189 inhabitants per sq. kilometre; Barcelona, 175; Guipuzcoa, 137; Madrid, 133, and Pontevedra,

121. It must be remembered, however, that it is Barcelona and Madrid that are responsible for the density of the population in two of these provinces, and that in the same way Biscay contains Bilbao and Guipuzcoa contains San Sebastian.

Pontevedra is the province with the greatest actual density of population per kilometre, followed by La Coruña, while those with the lowest density are Soria with 14, Guadalajara, Cuenca and Huesca with 16, Albacete with 19 and Cáceras with 20. The average birth-rate for the period 1918-22 was 29.2 per 1,000 inhabitants, and the mortality 24.4—a high rate which is leading to a demand for hygienic reform among the more enlightened sections of the community.

*Agriculture.*—The abnormal profits made during the War led to an extension of the areas under cultivation, some of them unsuitable, and also to the uneconomic exploitation of forests, with the following three results: (a) the extensive purchase and use of agricultural machinery; (b) the introduction of better methods of cultivation; (c) hygienic improvements on the farms, and the provision of water for irrigation purposes. Much benefit is expected when the following irrigation works are completed:—

(1) The central canal of Aragon, with its smaller offshoots, which, with the Ebro, will water 300,000 hectares of Upper Aragon.

(2) The irrigation works of Alicante and Murcia, now almost completed, which are turning the steppes of those provinces into orchards.

(3) The series of reservoirs and canals, some of them completed, like that at Jerez and others under construction, which will irrigate 100,000 hectares in the fertile valley of Guadalquivir.

(4) The works already begun for making the Guadalquivir navigable up to Córdoba, the construction of weirs to regulate the course of the river and reservoirs from the springs feeding the Guadalquivir which will provide electrical power and also help navigation.

The works under (1) and (3) are State; (2) and (4) are private enterprises.

In Old Castile and in the "Reino" de León the experimental farms of Palencia, Valladolid and Zamora are introducing new arable methods, and there is noticeable progress in all parts, though in the north and northeast, with their small holdings and lack of credits, the advance is not so rapid.

The average production of wheat was:—

|                      |                            |
|----------------------|----------------------------|
| In 1910-4 . . . . .  | 34,119,556 metric quintals |
| In 1915-9 . . . . .  | 38,061,869 metric quintals |
| In 1919-24 . . . . . | 35,437,831 metric quintals |

an increase that has made Spain self-supporting in cereals apart from bad harvest years like those of 1922 and 1924.

Spain has now attained first place in the world production of olive oil, with marked effects on its trade balance. The average production of oil in metric quintals was:—

|                  |           |                  |           |
|------------------|-----------|------------------|-----------|
| 1905-9 . . . . . | 1,961,985 | 1915-9 . . . . . | 3,105,313 |
| 1910-4 . . . . . | 2,132,960 | 1920-4 . . . . . | 3,034,761 |

The olive cultivation areas were: 1914, 1,453,000 hectares; 1917 over 1,504,273 hectares; 1924 over 1,624,233 hectares.

Andalusia alone produces two-thirds of Spain's output of an average of 300,000 metric tons per annum, which is more than 45% of the world's production.

The valuable wine trade suffered from the same crisis which affected both France and Italy, but production is increasing, the average figures (incomplete) being: for 1915-9, 20,072,703 hectolitres; for 1920-4, 23,882,000 hectolitres.

The production of beet sugar is increasing, and in the valley of the Guadalquivir is very profitable, owing to the high sugar content. This success reacts on the industry throughout Spain, because of the cheapness of the arid land on which beet cultivation was first started. The average value of agricultural products was estimated at 3,824,394,425 pesetas for 1903-07, at 7,975,623,025 in 1916 and at 9,201,476,000 in 1923.

*Commerce.*—The character of Spain's foreign trade changed during the War, for the balance hitherto always unfavourable save at exceptional periods, as for example, when the French vines were attacked by phylloxera, became favourable.

| Average imports in pesetas |               | Average exports in pesetas |               |
|----------------------------|---------------|----------------------------|---------------|
| 1910-4 . . . . .           | 1,868,446,602 | 1910-4 . . . . .           | 1,092,129,014 |
| 1915-9 . . . . .           | 1,110,239,020 | 1915-9 . . . . .           | 1,263,546,180 |
| 1920-4 . . . . .           | 2,573,522,339 | 1920-4 . . . . .           | 1,306,689,864 |

It must be remembered, however, that the imports for 1915-9 include the large remittances of gold which the bank of Spain amassed during the War. The commercial landslide from which the country suffered after the War can be gauged from the fact that whereas in 1919 the balance of exports over imports rose to 235,000,000 pesetas, the imports in 1920 exceeded exports by 420,000,000 and in 1924 by 1,199,000,000. Spain met this unfavourable balance by invisible imports such as the freights earned by her mercantile marine, and by the large remittances sent by its emigrants in America, to the value of over 200,000,000 of pesetas for the northwest region alone. This latter source of revenue is continually increasing owing to the growing custom of the emigrants of leaving their families in Spain for the first few years, and also owing to the increasing economic importance of definitely Spanish centres in certain countries such as Cuba, Mexico and Argentina. The following figures (pesetas) are for the last year available, 1924:—

| Imports                              |  | Pesetas       |
|--------------------------------------|--|---------------|
| Livestock . . . . .                  |  | 14,803,260    |
| Raw materials . . . . .              |  | 955,841,063   |
| Manufactured articles . . . . .      |  | 1,497,589,893 |
| Foodstuffs . . . . .                 |  | 476,652,218   |
| Gold in bullion and coin . . . . .   |  | 2,146,090     |
| Silver in bullion and coin . . . . . |  | 123,380       |
| Total . . . . .                      |  | 2,947,155,804 |
| Exports                              |  | Pesetas       |
| Livestock . . . . .                  |  | 3,639,220     |
| Raw materials . . . . .              |  | 350,465,603   |
| Manufactured articles . . . . .      |  | 401,245,505   |
| Foodstuffs . . . . .                 |  | 992,234,967   |
| Gold in bullion and coin . . . . .   |  | 2,442         |
| Silver in bullion and coin . . . . . |  | 262,380       |
| Total . . . . .                      |  | 1,747,850,177 |

Thus, agriculture alone supplied in foodstuffs 56% of the total exports, whereas manufactures contributed only 22%.

Of the imports in 1924 Great Britain contributed 17.16%, the United States 16.55, France 13.74, Germany 5.90 and Argentina 4.70. Of the exports, Great Britain absorbed 21.80%, France 19.79; the United States 10.01, Cuba 6.03, Argentina 5.71 and Germany, 5.66. Spain has had considerable tariff difficulties with other countries. An Anglo-Spanish commercial treaty was ratified in April 1924, and remains in force for three years from the date of ratification.

*Industry.*—Since the War Spain has tended to become self-supporting, and there is a general tendency to substitute goods of Spanish origin for foreign imports. Many industries however have been passing through periods of severe depression due to some extent to the poor purchasing power of the middle and working classes. The textile industries of Catalonia more particularly have been suffering from an inadequate home demand and also from a reduction in exports, leading to a strong demand for protection. The equipment of this industry is not sufficiently up-to-date, as only a small proportion of the spindles in use are of recent construction. Moreover Spanish textiles are not concentrated in large concerns, but divided among small firms. The War, however, gave the textile industry a period of prosperity hitherto unknown. Taking the 1913 index as 100, the following table shows imports and exports:—

|                   | 1914  | 1915  | 1916  | 1917  | 1918  | 1919  | 1920  |
|-------------------|-------|-------|-------|-------|-------|-------|-------|
| Cotton textiles:  |       |       |       |       |       |       |       |
| Imports . . . . . | 92.2  | 150.4 | 111.5 | 107.5 | 68.4  | 80.3  | 101.3 |
| Exports . . . . . | 93.5  | 316.8 | 246.9 | 258.2 | 233.3 | 239.2 | 137.8 |
| Woollen textiles: |       |       |       |       |       |       |       |
| Imports . . . . . | 67.7  | 93    | 102.7 | 66.1  | 169.9 | 73.7  | 103.8 |
| Exports . . . . . | 188.9 | 583.5 | 411.1 | 342.1 | 283.5 | 337.7 | 184.5 |

In the years 1922-4, cotton manufactured goods were exported to the value of 54, 56 and 54 millions of pesetas; and woollen to the value of 33, 37 and 43. The sugar industry continues to grow, the average annual production of sugar for the period 1915-9 being 121,789 and in 1920-4, 174,215 metric tons. The iron and steel industry benefits from the high tariff, and has been erecting more factories, but the latest statistics, those for 1922,

do not include the new plant installed in the northeast and in Biscay, and make no mention of the extensions rendered possible in Biscay and Barcelona by the construction of new locomotives for the railways, or of the huge electrical plant erected in Córdoba.

**Mining.**—The output of minerals in 1923 was 1,900,000 tons in excess of that in 1922. The following are the values for 1922 and 1923:—

|          | 1922                   | 1923                   |
|----------|------------------------|------------------------|
| Minerals | Pesetas<br>290,391,411 | Pesetas<br>389,370,340 |
| Metals   | 460,708,518            | 730,021,550            |
|          | 751,099,929            | 1,119,391,890          |

This apparent increase of 368,000,000 ought to be reduced to 140,000,000, owing to the inclusion in the 1923 figures of certain items which did not appear in those for 1922. The production of coal represents 50% of the total mineral production of the country, but the coal industry whose output, including lignite, was 1,600,000 tons more than that in 1922, began to experience difficulties in 1924, owing to a variety of causes, such as the resumption of imports which tended to close the poor pits exploited during the War, the gradual re-adaptation of industry to peace conditions, and the general causes which depressed the industry throughout the world. Consequently some mines were closed down, there was a decrease in employment, followed by an increase of production per head of labour employed. Thus in 1920, when the highest price per ton was reached, namely 70 pesetas, the production of Asturias—the district accounting for 50% of the national production—was 2,900,000 tons for 39,000 miners; and in 1924 the production was 3,900,000 tons for 30,000 miners, while the price per ton fell from 70 pesetas in 1920 to 27 in 1924. National production, which was 4,200,000 tons in 1914, rose to 6,200,000 in 1924, but does not meet the national consumption, which is increasing, for, whereas in 1920 it was 5,800,000 tons, in 1924 it rose to 7,600,000, the difference being mainly imported from England. Apart from coal, the principal minerals are pyrites, zinc, iron ore, copper and lead.

**Communications.**—The network of main roads maintained by the State, which at the beginning of the War totalled 51,634 km., rose in 1919 to 58,022, and at the end of 1925 exceeded 60,000. The railway lines according to the 1923 statistics covered 15,300 km., excluding the construction of the double line which is well on its way. The average annual number of passengers carried from 1915-9 was 72,045,742, rising in 1920-4 to 103,583,881 and the tonnage of goods carried, which was for 1915-9 34,345,773, rose in 1920-4 to 35,262,932 (figures incomplete), despite the rise in tariffs and the industrial crisis of 1920-1. Revenue per kilometre has risen from 27,602 pesetas to 51,828 and expenditure from 14,850 to 37,550. The outstanding feature of railway administration in 1925 was the Railway Statute passed by the Military Directorate which provides for the participation of the State in the financing and management of the railways. In connection with the first issue of railway bonds by the State in Oct. 1925, the Government was able to vote 300,000,000 pesetas for improvements in the transport service, which is still inadequate for the industrial necessities of the country.

**Shipping.**—Spanish shipping is still in a backward state, the percentage of ships over 20 years old being 52.27, compared with 21.72%, the average calculated for the rest of the world. Consequently, though the Spanish merchant marine is absorbing the coastal trade, in the ocean-going trade there is an increase in the number of vessels under foreign flags which enter and leave Spanish ports with cargoes of Spanish imports and even with a considerable portion of the exports. The result is that the shipping interests are insisting more and more on protection.

|      | Sailing Ships |         | Steamships |           |
|------|---------------|---------|------------|-----------|
|      | Number        | Tonnage | Number     | Tonnage   |
| 1914 | 237           | 32,974  | 633        | 747,022   |
| 1925 | 554           | 95,775  | 687        | 1,141,529 |

**Banking.**—The Bank of Spain which in 1913 held 472,000,000 gold pesetas, held in 1920 over 2,448,000,000 and at the beginning of 1925 2,558,000,000, representing a reserve of over 58% of the 4,352,000,000 pesetas in note circulation at the same date. The guarantee credits which in 1915 were 166,000,000 rose to 1,830,000,000 at the beginning of 1925, and the current credit accounts rose from 689,000,000 to 1,209,000,000. The dividends since 1900 have never fallen below 19%, and were 44% in 1921, and despite the rise in the shares, they continued to pay 28% in 1922 and 1923. The fall in the prestige of Spanish private banks, due to more than one failure, and the large number of bankruptcies since 1922, have compelled the directorate to take steps for exercising closer supervision over private banks. Savings bank returns show an increase from 525,372,000 pesetas in 1915 to 756,000,000 in 1918, 1,456,000,000 in 1922 and, it is calculated, over 2,000,000,000 in 1925.

Towards the close of 1923, and up to the end of March 1924, the peseta gradually weakened, but in April there was a sharp recovery, due to government measures to regulate speculation in exchanges, which was followed, however, by a gradual depression. The peseta, whose par of exchange in sterling is 25.22½, fluctuates from about 33.50 to about 34.50, and in view of the strong position of the Bank of Spain and the improvement in the trade and budget deficits, it is difficult to explain its depreciation. (F. DE LOS R.)

**SPANISH LITERATURE** (see 25.578).—The dominant feature of Spanish contemporary literature in 1910-26 may be found in a more conscious realisation of the creative element of the race by its critical element and, therefore, in a tendency towards the fusion of both these elements into a complete whole. With the death of Galdos, the sceptre of Spanish literature passes to Miguel de Unamuno, who represents the modern version of the Spanish mystic writer. His main concern is the relation of man to creation. It is the subject of his masterpiece *Del Sentimiento Trágico de la Vida* (1913), a book of passionate meditation (of which an excellent translation exists in English, *The Tragic Sense of Life*, 1921), and as an attitude of mind it dominates his criticism; *En torno al Casticismo* (1902), *Ensayos* (1916), *La Agonía del Cristianismo* (1926); his novels: *Niebla* (1914), *Abel Sánchez* (1917), *Tres Novelas Ejemplares y un Prólogo* (1920) and his play: *Fedra*. In these works Unamuno appears as the apostle of an ideal of life more closely connected with spiritual Easternism than with the intellectual and social tenets of the West. He thus fulfils in Spain much the same function as Dostoevsky did in Russia, for Spain like Russia is a transition between East and West. He aims at intensity rather than extension. His style is not unlike the style of Carlyle in that it is written with the whole being of the man, body and soul.

If, in order to complete the parallel with Russia, a Spanish western type of mind had to be opposed to Unamuno, as Turgenev could be opposed to Dostoevsky, a younger man, José Ortega y Gasset, might be selected for this purpose. Ortega y Gasset is a refined humanist, strongly influenced by German contemporary Neo-Kantian schools of thought. His main work is in the field of criticism and psychology—*Meditaciones del Quijote* (1911), *El Espectador* (1917). In more recent books he has endeavoured to draw philosophical and psychological conclusions from current events; for instance, in the field of politics with his *España Invertebrada* (1922) and in that of philosophy and science with *El Tema de nuestro tiempo* (1923), a masterly commentary on the new vistas opened out to thought by the discoveries of Einstein. In this same school may be included José Martínez Ruíz (b.1876), better known under his literary name of Azorín, whose art has all the finish and exquisiteness, all the smallness also, of miniature painting. He has had the rarer merit of applying these gifts to the interpretation of national scenes and places, as in his *Castilla* (1920); *Los Pueblos* (1905); *La Ruta de Don Quijote* (1905), and has thus contributed in no small measure to the movement for national self-knowledge which is noticeable in contemporary Spain.

**Fiction.**—In fiction, though belonging to an older generation, Vicente Blasco Ibáñez must be mentioned. His war novel

*Los Cuatro Jinetes del Apocalipsis* (1916, Eng. trans. 1918) has made him famous with the English-speaking public. Older novels (and better ones) have been translated, such as *La Barraca* (1899); *The Cabin* (1919); *Sangre y Arena* (1908) and *The Matador* (1918). Blasco Ibáñez represents an art which is Spanish only in its subject but not in its spirit, manner or style.

Of a younger generation, Pío Baroja (b. 1872) is perhaps the most widely read. A Basque, with all the acuity of mind of his race and not a little of its rustic independence and antagonism to civilisation, Baroja writes abundantly and carelessly with more spirit than art. His best work is perhaps *Idilios Vascos*, in which he has rendered the quaint charm of his own country. Many of his works have been translated into English by American publishers. To this generation belongs also Ricardo León, who writes in a more consciously traditional vein and pays considerable attention to matters of style. His main work is *Casta de Hidalgos* (1908). Concha Espina, a brilliant woman novelist, has distinguished herself by novels of psychological insight and easy style, such as *El Metal de los Muertos* (1920).

Ramón Pérez de Ayala (b. 1881) is perhaps the best novelist of the younger generation. A critic of great talent and a poet, he has written several novels, the best of which are *Novelas Poemáticas de la Vida Española* (1916) (translated into English under the title of *Prometheus*) and *Belarmino y Apoloquio* (1921). He is a typical exponent of the fusion of the traditional Spanish spirit with the conscious knowledge of its resources referred to above, as characteristic of contemporary literature in Spain. The same may be said of Gabriel Miró, whose delicate sensibility and deep knowledge of the language make him one of the most richly endowed authors of contemporary Spain. Among his works are *El Humo Dormido* (1920); *El Libro de Sigüenza* (1921); *Figuras de la Pasión del Señor* (1916) (this last translated into English 1924). Of recent years several authors have cultivated the utopian and satirical variety of novel-writing. To this kind belong *El Archipiélago Maravilloso* (1923) by Luis Araquistain, and *La Girafa Sagrada* by S. de Madariaga (originally written in English and published 1925). Among newcomers in novel-writing Claudio de la Torre and Felix Urabayen, *El Barrio Maldito* (1925) must be singled out.

**Drama.**—Jacinto Benavente still dominated the Spanish theatre during this period. His most famous play, *Los Intereses Creados* (1907), is not representative, for it illustrates but one phase of the talent of this many-sided author. A more powerful tragedy, *La Noche del Sábado* (1903), is of the same period. In more recent times he has given an intense drama of life in *La Malquerida* (1913). There is, however, a type of play in which Benavente must yield the prize to the brothers Álvarez Quintero (Serafín, b. 1871; Joaquín, b. 1873). As authors of Comedias de Costumbres these two writers, who always work together, are unsurpassed. The list of their comedies is long, and includes *Las de Caín* and *Puebla de las Mujeres* (1912). Other playwrights of note are Linares Rivas (b. 1866), remarkable for his skill in the handling of dialogue; Martínez Sierra, a name which stands for the collaboration of Don Gregorio Martínez Sierra (b. 1881) and his wife, resulting in a happy blend of dramatic skill and delicate psychology; and Pinillos (Parmeno) (1875-1923), a vigorous painter of social conflicts. The poetical theatre still lives in Spain, maintained by Valle-Inclán (b. 1870), Marquina Cata and Ardavin. In recent years a writer of unusual power, Jacinto Grau, has conquered the foreign stage, particularly with his *El Conde Alarcos* (1917), *El Hijo Pródigo* (1918). But drama and comedy are only one, and that not the most important, aspect of the Spanish theatre. Still more typical of the nation is what is modestly known in Spain as *Género chico* (small genre), a type of theatrical production consisting in plays generally short and accompanied by music and ranging from variety pieces akin to operettas to little masterpieces of musical drama. Its best-known exponents are the brothers Quintero and Carlos Arniches (b. Alicante, 1866).

**Poetry.**—The two main influences acting on Spanish poetry towards the close of the 19th century, i.e., national tradition and the example of foreign poetry, particularly that of the symbolist

school of France, which reaches Spain through South-American poets, such as Rubén Darío, are still at work. Though the first is the more vigorous and conscious, the second widens so as to include all influences: D'Annunzio, Maeterlinck, Tagore. More typically national are Unamuno, *Rosario de Sonetos Líricos* (1911), *El Cristo de Velázquez* (1920); Antonio Machado (b. 1875), whose pessimistic serenity is in keeping with the landscape of central Spain (*Soledades*, *Campos de Castilla*) and Salvador de Madariaga (b. 1886), whose *Romances de Ciego* (1922) re-state in a new form the old Spanish theme of Jorge Manrique. Other poets produce under more complex influences. Thus Manuel Machado (b. 1874), whose main inspiration is popular, and southern has, nevertheless, written excellent verse in which the influence of French elegant sensibility is discernible; Juan Ramón Jiménez (b. 1881), remarkable rather for exquisite sensitiveness than for power (*Arias Tristes* and *Elegías*, 1908-10), is led by his melancholy moods towards fluid rhythms which, though more settled, are reminiscent of Maeterlinck and, through him, of Rossetti. Ramón del Valle-Inclán (1870), perhaps the most skilful musician among modern Spanish poets, has given in *La Marquesa Rosalinda* (1913) an admirable example of the adaptability of the Spanish language to the most exquisite and complicated rhythms. Ramón Pérez de Ayala in his three volumes, *La Paz del Sendero* (1916); *El Sendero Innumerable* (1916); and *El Sendero Andante* (1921), effects a happy wedding of thought with harmonious poetry in a work not wholly uninfluenced by Francis Jammes, D'Annunzio and Walt Whitman. Among the rising generation may be mentioned Pedro Salinas, Jorge Guillén, García Loria and Rafael Alberti.

**Miscellaneous.**—In the field of erudition and literary history the task of Menéndez y Pelayo is continued by Don Ramón Menéndez Pidal, whose works on the poem "Mio Cid" (1911, 1913, etc.) and on the Spanish Chronicles have thrown much light on the origin of Spanish epic poetry. Francisco Rodríguez Marín (b. 1855), editor of *Don Quijote*, a specialist of Spanish folk lore, has succeeded the Master as head of the National Library. Father Asín has won world-wide fame by his illuminating work on the Arabic origins of Dante. Of the younger generation Federico de Onís (b. 1885) has edited *Fray Luis de León* (1914) and Américo Castro (b. 1885) has worked on *Lope de Vega* (1919).

Journalism, always a great art in Spain, where the newspaper is infinitely more read than the book, is cultivated by all writers and everyone of the names mentioned above might be quoted here again. Mention must be made, however, of two eminent contemporary writers whose work is almost exclusively journalistic: Ramiro de Maeztu (b. 1874), a versatile mind whose educating influence on the Spanish reading public has been incalculable; and Luis Araquistain, a powerful dialectician and a master of the polemic style.

**BIBLIOGRAPHY.**—César Barja, *Literatura Española, Libros y Autores Modernos* (1924); E. L. Gómez de Baquero, *El Renacimiento de la Novela Española en el Siglo XIX*. (1924); Miguel de Unamuno, *En Torno al Casticismo* (1902); W. Starkie, *Jacinto Benavente* (1924); S. de Madariaga, *The Genius of Spain* (1923). (S. DE M.)

**SPECTROSCOPY** (see 25.619).—As developed since 1910 the science of spectroscopy has for one of its chief purposes the analysis of spectra, and the deduction therefrom of the structure of the atoms and molecules which generate the spectra. The progress which has been made in this connection has depended upon improved determinations of the wave-lengths of spectral lines, the further investigation of the varying spectrum of the same substance when excited to luminosity in different ways, the more complete analysis of certain spectra into regular series systems and, finally, on theoretical investigations. In another direction, important advances have been made in the interpretation of the spectra of the various classes of celestial bodies, which may be regarded physically as experiments on large masses of matter at various high temperatures.

**Standards of Wave-length.**—Extensive interferometer determinations of wave-lengths in the arc spectrum of iron, based upon 6438.4696 "international" angstroms for the red cadmium line.

have been made by K. Burns<sup>1</sup> and others, which provide the necessary standards for the general determination of wave-lengths by interpolation. It has been found, however, that the wave-lengths of many lines differ considerably in different parts of the arc, so that special precautions are necessary in order to obtain comparison spectra in agreement with the tabulated standards. Probably the most accurate set of standards are those given by C. E. St. John and H. D. Babcock,<sup>2</sup> who used a small central zone of a "Pfund" iron arc operated between 110 and 250 volts with five amperes or less, at a length of 12 millimetres. This list contains 1,026 lines, from  $\lambda 3370$  to  $\lambda 6750$ , and for most of them the wave-lengths are believed to be accurate to 0.001 ångström.

**Flame, Arc and Spark Spectra.**—The range of spectroscopic research has been almost indefinitely extended by the discovery that the same substance yields different spectra when stimulated in different ways. Such differences are of little importance from the point of view of chemical analysis, but they have become of great significance to the physicist, and have also greatly aided in the interpretation of the spectra of celestial bodies.

The three typical methods of producing luminosity for the observation of the spectra of metallic elements or their salts are the flame, the electric arc and the electric spark. As a general rule, the three sources exhibit important differences. In the flame the lines are comparatively few in number; in the arc the flame lines remain prominent, but many more lines, including some which are as strong as the flame lines, make their appearance. In the spark, there is a tendency for many of the typical arc lines to disappear, whilst other lines may be much intensified, and entirely new lines may also be present. The important class of lines which are intensified, or which only appear under the violent action of the condensed spark, were designated enhanced lines by Sir Norman Lockyer, and this name has been generally adopted. The different classes of lines are thus commonly known as flame, arc and spark (or enhanced) lines, according to their relative prominence in these three sources. This classification, however, is in some respects imperfect, and more definite designations are now based upon the theoretical considerations to which reference will be made later. A detailed temperature classification of the lines of many elements has been based upon experiments with the electric furnace by King.<sup>3</sup>

Similar variations have also been observed in the spectra of gases when submitted to the action of discharges of varying intensity, and the different classes of lines are sometimes distinguished by analogy as arc and spark lines, although with few exceptions the arc is not actually employed. The actual spectrum given by a gas depends upon its pressure as well as upon the intensity of the discharge by which it is made luminous. Generally speaking, the greater the pressure of the gas the greater will be the strength of the discharge required to produce the "spark" lines.

One important aim of spectroscopic research has been to search for an explanation of these phenomena, for it cannot be doubted that the causes of the variations in the spectra are intimately connected with atomic structure. In this connection it will be instructive to refer first to the spectra of known compounds. There are many compounds which can be excited to luminosity without total decomposition,<sup>4</sup> and it has been found that each compound gives a characteristic spectrum by which it can be identified as such. These spectra invariably consist of bands, and different sets of bands characterise, for example, the oxides, chlorides and fluorides of the alkaline earth elements.

It is sufficiently obvious that if a compound be stimulated so strongly that it becomes dissociated, the spectrum will change from one consisting of bands representative of the compound to one containing the lines of the constituent elements. It is not only compounds, however, that show changes of this character. Experiments on nitrogen, for instance, show a range of spectra from one consisting wholly of bands to one in which lines occur alone. Even hydrogen has two spectra: (a) the highly complex, so-called secondary spectrum, which doubtless represents a banded spectrum of rather coarse structure<sup>5</sup> and (b) the familiar line spectrum, constituting the Balmer series. Similar results have been obtained for many other elements, and from analogy

with the spectra of compounds the natural conclusion is that the band spectra of the elements arise from molecules, while the line spectra are produced by the atoms which are set free when the molecules are dissociated.

If this be a true view, the change in the structure of the atom, or in its mode vibration, which accompanies the successive modifications of the line spectrum becomes a question of paramount interest. Lockyer<sup>6</sup> did not hesitate to believe that while the arc lines of an element were to be attributed to ordinary atoms, the enhanced lines could only be produced by the splitting-up of the atoms themselves, and he called these simpler forms of matter the proto-elements. Proto-calcium, for instance, denoted calcium which had been broken up into sub-atoms by the application of a sufficient stimulus. A somewhat similar, but more probable, explanation has been based upon an application of the quantum theory by Bohr to Rutherford's nucleus theory of the atom. This theory is founded largely on the analysis of spectra into regular series. (See ATOM.)

**Range of Observations.**—For the complete determination of the laws of spectra it is necessary to extend the observations far beyond the limits of the visible spectrum. Conspicuous success in the direct photography of the near infra-red spectrum has been achieved by Meggers and others, by the use of ordinary plates stained with dicyanin.<sup>7</sup> By this method excellent photographs of the arc spectra of a large number of elements, extending to  $\lambda 10,000$ , have been obtained with a concave grating, and the positions of the lines have been measured with a high degree of accuracy. For the present, the extreme infra-red can only be investigated by thermal effects, involving the use of the thermopile, bolometer or radio-micrometer, as in the researches of Paschen, Lehmann and Randall.

Spectroscopic observations in the direction of the ultra-violet, beyond the limit about  $\lambda 1850$  set by the absorption of quartz, and beyond about  $\lambda 1700$  set by the absorption of air, which were first made by Victor Schumann, have been greatly extended by the use of concave gratings in vacuum spectrographs by Lyman and others. R. A. Millikan<sup>8</sup> and his colleagues have observed lines as far as  $\lambda 136\text{Å}$ . Several improvements in technique were necessary to this success. It was achieved, in the first place, by using gratings specially adapted for the purpose; secondly, by working in an essentially perfect vacuum, through the use of powerful pumps; and finally, since no ordinary spark could pass in a vacuum, by the use of a specially strong sparking apparatus which was capable of forcing a discharge across a very small space between the electrodes.

Spectroscopic data thus cover a very wide range, and offer many interesting problems to the investigator. Their solution depends on his ability to make a true analysis of spectra, and to deduce therefrom the corresponding atomic or molecular conditions.

**Analysis of Spectra.**—Great progress has been made in the investigation of the regularities in spectra. In these inquiries the position of a spectral line is most conveniently represented by its "wave-number" ( $\nu$ ); i.e., the number of waves per centimetre *in vacuo*. In practice it is obtained by dividing  $10^8$  (the number of ångström units in a centimetre) by the wave-length as corrected to a vacuum. The simplest spectrum is that of hydrogen, which may be accurately represented by the simple formula:—

$$\nu = R \left( \frac{1}{m_1} - \frac{1}{m_2} \right)$$

where  $m_1, m_2$  are integers and  $R$  is the "Rydberg constant," having the value  $109,678.3$ .<sup>9</sup> If  $m_1 = 1$  and  $m_2$  takes successive integral values 2, 3, . . . the formula represents a series of lines in the extreme ultra-violet which has been called the "Lyman series." With  $m_1 = 2$ ,  $m_2 = 3, 4, \dots$ , there results the "Balmer series," extending through the visible spectrum to the near ultra-violet. Other series which appear in the infra-red, including the "Paschen series," are similarly represented by putting  $m_1 = 3, 4$  and so on. R. W. Wood<sup>10</sup> has extended the Balmer series to  $m = 22$  by experiments with long vacuum tubes, while 34 members of this series have been recorded in the spectrum of the sun's chromosphere during total eclipses. In each series, it should be noted, the lines become closer together and diminish in intensity as they approach the definite limit indicated by the first term of the formula. Theoretically, the number of lines in a series is infinite, but it often happens that only a few of the earlier members are observed, and no series has been traced to its limit.

<sup>5</sup> An excellent photographic map of this spectrum has been given by T. R. Merton. *Proc. Roy. Soc.*, A, vol. 96, 382 (1920).

There is only one other known spectrum which has the same simplicity as that of hydrogen—namely, the enhanced spectrum of helium. This includes the series first found by Pickering in the star  $\zeta$  Puppis, and the line  $\lambda$  4686 and others calculated by Rydberg, by whom both series were attributed to hydrogen. These lines were produced in the laboratory by A. Fowler,<sup>1</sup> and additional lines of the Pickering series, first indicated by Bohr's theory, were afterwards observed by E. G. Evans<sup>2</sup> and by Paschen.<sup>3</sup> It was, in fact, the theoretical work of Bohr which first suggested that the lines in question originated in helium and not in hydrogen.

The enhanced series of helium can be represented by a formula similar to that for hydrogen, with the difference that the series constant has rather more than four times the value for hydrogen, namely  $4 \times 109723$ . When  $m_1 = 3$ , and  $m = 4, 5, \dots$  we obtain the series having  $\lambda$  4686 for its first number. The complete Pickering series is given by putting  $m_1 = 4$ ,  $m = 5, 6, \dots$ , and a series in the extreme ultra-violet observed by Lyman is given when  $m_1 = 2$ . It should be noted that alternate lines of the Pickering series are nearly coincident with the Balmer series of hydrogen.

The spectra which are next in order of simplicity are the arc spectra of the alkali metals, lithium, sodium, potassium, rubidium and caesium. In each of these there are several series superposed, and all the lines are doublets. In the alkaline earth metals, beryllium, magnesium, calcium, strontium and barium, there are two systems of series, one consisting of singlets and the other of triplets. As in the spectrum of hydrogen, the lines of each series converge to a definite limit and may be represented by such a formula as that of Hicks, namely

$$\nu = A - R \left/ \left[ m + \mu + \frac{a}{m} \right]^2 \right.$$

where  $A$ ,  $\mu$ ,  $a$  are constants calculated from the observed lines and  $m$  takes successive integral values.  $A$  is the limit of the series, and  $R$  the Rydberg constant. The constituent series are of different types, having names and symbolical representations as follows:—

|                    |             |
|--------------------|-------------|
| Principal series   | $= 1s - mp$ |
| Sharp series       | $= 2p - ms$ |
| Diffuse series     | $= 2p - md$ |
| Fundamental series | $= 3d - mf$ |
| F G series,        | $= 4f - mg$ |
| etc.               | etc.        |

In each case the first term denotes the limit of the series, while the second represents a sequence of terms, in which  $m$  has successive integral values. A group of such series constitutes a system, and there may be two or more systems in the same spectrum, as the singlet and triplet systems of the alkaline earths. It will be observed that in a given system the limit of a series is a term of one of the other series, and that a line is always represented as the difference of two terms. As first indicated by Ritz in his "Combination Principle," other series may exist, such as  $2s - mp$ ,  $3p - md$ , etc.

In a singlet system, each of the terms has but one value, and all the lines are single. In a doublet system,  $s$  has one value and all the rest two values. The principal series thus consists of doublets,  $1s - mp_2$  and  $1s - mp_1$ , diminishing in separation towards the limit; the sharp series of equidistant pairs  $2p_2 - ms$ ,  $1p_1 - ms$ . The diffuse doublet series does not consist of double-doublets, as might have been expected, but of groups of three, one possible component being ruled out by a principle of selection to be mentioned later. In a triplet system, all but the  $s$  terms have three values, and certain intercombinations with the associated singlet system also occur.

**Origin of Spectra.**—The theory of N. Bohr<sup>4</sup> offers a very satisfactory explanation of the spectra of hydrogen and enhanced helium, and gives a physical meaning to the spectroscopic terms in general which has proved very fruitful in suggesting new directions of research. According to this theory, the atom of

an element consists of a positively charged nucleus with an appropriate system of electrons in orbital motion around it, such that the total negative charge of the electrons is equal to the positive charge of the nucleus. Nearly the whole of the mass of the atom is concentrated in the nucleus, which is very small in comparison with the distances separating it from the electrons. When an electron is removed from its normal position by the application of an external stimulus, it may traverse temporarily one or another of certain orbits determined by quantum considerations and is said to be "excited." In each of these orbits it has a certain amount of energy, and there is no radiation so long as the electron revolves in such an orbit. When the electron returns to its normal position it comes to an orbit in which, for equilibrium, it must possess less energy than it had in the temporary orbit. The difference of energy, which is proportional to the difference of the corresponding terms, is emitted as a homogeneous radiation, and gives rise to a definite spectral line, while, if the electron occupies successively different orbits on its return, several lines will be produced in succession. The actual spectrum at any moment is the summation of the different lines yielded by atoms in different states.

The differences between the arc and enhanced spectra receive a simple explanation on the Bohr theory. The lines of an arc spectrum are supposed to be generated by the disturbance of a single outer electron and its subsequent interaction with the nucleus and remaining electrons. When two electrons are removed from their normal positions, and one remains at a great distance, the return of the second electron generates an entirely different spectrum consisting of the enhanced lines. An atom which has lost an electron is said to be "ionised": if it has lost two electrons it is doubly ionised, and so on.

Assuming the hydrogen atom to consist of a nucleus and a single electron, the energies of the possible orbits can be calculated, and are found to be proportional to the observed terms  $R/m^2$ . Helium, the next lightest element to hydrogen, has two electrons, and the mathematical problem of determining their motion has not yet been solved. If one of the electrons is removed, however, the atom is similar to that of hydrogen, except that the nucleus has a double positive charge and four times the mass. The resulting enhanced terms are therefore calculable. They again have the form  $R/m^2$ , but  $R$  has now a much larger value than it has for hydrogen. It is represented in both cases

by the expression  $\frac{2\pi^2 e^2 E^2}{ch^2} \frac{mM}{m+M}$ , where  $e, m$  and  $E, M$  are re-

spectively the charge and mass of the electron and nucleus,  $h$  Planck's constant and  $c$  is the velocity of light. In the case of hydrogen  $E = e$ , and when the experimental values of the various quantities are substituted in the formula, the series constant is reproduced with remarkable accuracy. The second factor increases with  $M$ , so that it will be slightly greater for helium than for hydrogen. Also, the double nuclear charge makes the first factor in the expression four times as great for enhanced helium as it is for hydrogen. These theoretical requirements have been completely verified by experiment. Fowler, calculating  $R$  for hydrogen and enhanced helium from the observed lines, used the theoretical expressions to calculate the value of  $M/m$ ,—i.e., the ratio of the masses of the hydrogen atom and the electron—and obtained a result in very close agreement with that arrived at by direct measurement. Moreover, he has shown<sup>5</sup> that in the more complicated spectra of the alkaline earths the enhanced line terms are also represented by formulae in which  $R$  has four times its value for arc spectra.

More recently, F. Paschen has identified 4 R series and 9 R series in singly ionised and doubly ionised aluminium respectively,<sup>6</sup> while Fowler has traced series of silicon for which the series constant has the successive values  $R$ ,  $4R$ ,  $9R$  and  $16R$ .<sup>7</sup> For convenience of reference these spectra are designated Si

I, Si II, Si III, Si IV, and similarly for other elements. These results for elements at successive stages of ionisation give further strong support to Bohr's theory by their verification of the changing value of the series constant as electrons are detached from the atom one by one.

Further developments of the theory, taking into account the variation of the mass of the electron with velocity required by the theory of relativity, have indicated that the lines of the hydrogen and enhanced helium series are complex, and under high resolution should appear to consist of several components. This has been verified by Paschen,<sup>1</sup> who found results for helium in remarkable agreement with the predictions of Sommerfeld. The intensities of the several components also are in the ratio calculated by Sommerfeld by a special hypothesis.

**Resonance and Ionising Potentials.**—Strong support for the Bohr theory is also given by experiments in which atoms are bombarded by electrons of regulated speed. If an electron of charge  $e$  is made to fall through a potential difference  $V$ , it acquires a quantity of energy  $eV$ , expressed in appropriate units. If such an electron bombards a neutral atom, it is found that no change takes place until  $V$  reaches a certain value, when there is a sudden radiation of energy corresponding to a particular line—usually a strong flame line—in the spectrum of the bombarded atom. According to Bohr's theory, the energy in this radiation is equal to  $h\nu$ , and experiments with several elements show that this critical value of  $V$  is determined by the relation  $eV = h\nu$ . This means that the energy of bombardment has been just sufficient to remove the outermost electron in the atom from its normal orbit to the next permissible orbit, and, on its return, the electron restores the energy in the form of monochromatic radiation of the appropriate frequency. If  $V$  is expressed in volts, the wave-number of the emitted line is numerically equal to  $V \times 8102$ . The value of  $V$  when emission first takes place is known as the "resonance" or "radiation" potential. Further, by increasing  $V$ , it is possible to remove an electron from the atom altogether. If the energy  $eV$  in this case is equated to  $h\nu$ , the resulting value of  $\nu$  is found to be equal to the largest term in the spectrum. This term would correspond to the innermost orbit of the electron, and the result indicates that the energy which must be applied to remove an electron from the atom is just equal to the energy possessed by the electron when revolving in its normal position. The potential required to remove an electron from the atom is known as the "ionisation potential." It has been determined experimentally for a number of elements, and has been found to be in complete agreement with the orbital energy as calculated from the largest term in the spectrum. The Bohr theory thus presents a simple picture of the processes taking place in experiments of this type.

**Zeeman and Stark Effects.**—The resolution of spectral lines under the influence of intense magnetic fields—usually known as the Zeeman effect—has been extensively studied for a large number of elements. Somewhat similar effects, but much greater in magnitude, produced by an electric field, have been brought to light by Stark and examined in considerable detail by a number of workers. J. W. Nicholson and T. R. Merton<sup>2</sup> have shown that the Stark effect may operate to an appreciable extent in an ordinary vacuum-tube discharge, causing a broadening of the lines. Both the Zeeman and Stark effects have been treated on the basis of the Bohr theory with success. A comprehensive set of rules for the calculation of the Zeeman effect for any combination has been given by Landé.<sup>3</sup>

**The More Complex Spectra.**—The spectra of the higher groups of elements are much more complicated than those of the earlier groups, and few series of the same simple types have been identified. An advance of great importance, however, was made in Professor Fowler's laboratory by M. A. Catalan<sup>4</sup> in the identification of complicated groups of lines in the spectrum of manganese and other elements which could only be accounted for on the supposition that spectroscopic terms may have a greater multiplicity than that represented by triplets. The groups of lines in question, showing internal regularities, were named multiplets, but it may be noted that the  $pd$  and  $df$  combinations in a triplet system, each consisting of six lines, are also entitled to the same designation. With this beginning, the analysis of complex spectra has proceeded vigorously, and the structure of even so complicated a spectrum as that of iron has been elucidated. Thus, quartet, quintet, sextet and still higher systems of spectroscopic terms are now recognised.

Theoretical work based on quantum considerations has also progressed rapidly, and it is now possible to state quite briefly

the rules which have been deduced from the analysis of spectra. Following Sommerfeld and A. Landé,<sup>5</sup> a spectroscopic term in general may be represented by  $n_k j$ , where  $n$  is the "principal" quantum number (related to  $m$  of the previous formulae),  $k$  is the "rotational" or "azimuthal" quantum number,  $j$  a characteristic "inner" quantum number, and  $r$  represents the maximum multiplicity in the system to which the term belongs. It is convenient in practice to replace  $n_k$  by  $ms$ ,  $mp$ , etc., as used previously, it being understood that  $k=1, 2, 3, \dots$  for terms of  $s, p, d, \dots$  types respectively. The various components of a multiple term are then distinguished by using the relevant values of  $j$  as subscripts, which differ in this respect from the subscripts adopted until quite recently. When necessary to avoid ambiguity as to the system of terms under consideration, the multiplicity is indicated by an index figure on the upper left side of the term symbol. Thus  $3^3p_2$  indicates the term  $3p$  of a triplet system which has the inner quantum number 2, it being understood that all  $p$  terms have  $k=2$ . The characteristics of the first six groups of terms are shown in the appended table.

|       |                        |                           |
|-------|------------------------|---------------------------|
| $k=1$ | $S_0$ singlet<br>$r=1$ | $s_1$ doublet<br>$r=2$    |
| $k=2$ | $P_1$                  | $p_1 p_2$                 |
| $k=3$ | $D_2$                  | $d_2 d_3$                 |
| $k=4$ | $F_3$                  | $f_3 f_4$                 |
| $k=1$ | $s_1$ triplet<br>$r=3$ | $s_2$ quartet<br>$r=4$    |
| $k=2$ | $p_0 p_1 p_2$          | $p_1 p_2 p_3$             |
| $k=3$ | $d_1 d_2 d_3$          | $d_1 d_2 d_3 d_4$         |
| $k=4$ | $f_2 f_3 f_4$          | $f_2 f_3 f_4 f_5$         |
| $k=1$ | $s_2$ quintet<br>$r=4$ | $s_3$ sextet<br>$r=6$     |
| $k=2$ | $p_1 p_2 p_3$          | $p_2 p_3 p_4$             |
| $k=3$ | $d_0 d_1 d_2 d_3 d_4$  | $d_1 d_2 d_3 d_4 d_5$     |
| $k=4$ | $f_1 f_2 f_3 f_4 f_5$  | $f_1 f_2 f_3 f_4 f_5 f_6$ |

The combinations which ordinarily occur within the same system are those for which  $k$  changes by one unit; i.e.,  $\Delta k = \pm 1$ , and the  $p$  terms, for example, combine with  $s$  and  $d$  but not with  $f$ . The combinations are further restricted by the condition that  $\Delta j = \pm 1$  or 0, with the exclusion of the transition 0 to 0; thus, in a triplet  $pd$  combination the nine lines which are arithmetically possible are reduced to six, namely,  $p_2d_3, p_2d_2, p_2d_1, p_1d_2, p_1d_1$  and  $p_0d_1$ . When two or more systems occur in the same spectrum, the  $k$  and  $j$  rules are still applicable, and intercombinations are restricted to those for which  $\Delta_2 = \pm 2$ . Thus, in the alkaline earths there are both singlet and triplet systems, but in the combination of  $1S_0$  with  $3p$ , the application of the  $j$  rule shows that the only possible line will be  $1S_0-3p_1$ .

As an illustration of one of the simpler multiplets, the following quintet  $pd$  group in the arc spectrum of iron may be quoted, the positions of the spectral lines being indicated by their wave-numbers, and the relative intensities by figures in brackets following the wave-numbers:—

|           |             |              |              |              |       |
|-----------|-------------|--------------|--------------|--------------|-------|
| $d_0$     | $d_1$       | $d_2$        | $d_3$        | $d_4$        | $p_1$ |
| 36431(10) | 9036521(20) | 18436705(15) |              |              |       |
|           | 252         | 252          |              |              |       |
|           | 36269(20)   | 18436453(30) | 28836741(40) |              | $p_2$ |
|           |             | 390          | 390          |              |       |
|           |             | 36063        | 28836351(25) | 41636767(60) | $p_3$ |

**Anomalous Terms.**—The terms of ordinary types which have so far been considered are regarded as originating in the transitions of a single electron between different virtual orbits. It has been found, however, that in many spectra there are other terms resembling these in regard to their inner quantum numbers and Zeeman effects, but differing from them in following the combination rule  $\Delta k = 0$ ; these are distinguished by writing them in the form  $s', p', d', \dots$ , and are called "primed terms." A whole series of  $p'$  terms has been found in the alkaline earth spectra by H. N. Russell and F. A. Saunders<sup>6</sup> who have shown that the limit of the series is greater than that of any of the regular series. In other words, in some of the combinations  $pp'$  the atom radiates a greater amount of energy than that due to the largest jump which a single electron can make. The adopted explanation is that two of the outer electrons are displaced, and that the changes of energy of both are united in the emission of a single quantum.

<sup>6</sup> Astrophys. Jour., vol. 61, p. 38 (1925).

<sup>1</sup> Annalen d. Phys., vol. 50, pp. 901-940 (1916).

<sup>2</sup> Phil. Trans., A, vol. 216, p. 459 (1916).

<sup>3</sup> Zeit. f. Phys., vol. 15, p. 192 (1923).

<sup>4</sup> Phil. Trans., A, vol. 223, p. 127 (1922).

Other anomalous terms are similar in their combining properties to terms of regular types from which they differ, only in the fact that they have no place in the Rydberg series. These are distinguished by doubly accented letters, as  $p''$ ,  $d''$ , etc.

*Spectra and the Periodic Table.*—Attention is being drawn more and more to the relation of spectra to the periodic table of the elements. It has long been known that, when doublets or triplets occur in the spectra, the wave-number separations of their components (which are constant in the sharp and diffuse series) are approximately proportional to the squares of the atomic weights of the elements producing the spectra—so long as those elements belong to the same family sub-group. The Zeeman effect also is generally the same for lines of corresponding series in the spectra of elements belonging to the same group. But perhaps the most comprehensive connection of spectra with the periodic table is established by the "alternation law" and by the "displacement law" of Kossel and Sommerfeld.

The spectra of a large number of elements have now been successfully analysed, and it has been found that there is an alternation of even and odd multiplicities in successive columns of the periodic table. This has been most completely verified for the fourth period of the elements, for which the following details have been given by W. F. Meggers:—<sup>1</sup>

| Column<br>Element | I<br>K-19 | II<br>Ca-20 | III<br>Sc-21 | IV<br>Ti-22 | V<br>V-23   | VI<br>Cr-24 | VII<br>Mn-25 | VIII<br>Fe-26 | Co-27       | Ni-28       |
|-------------------|-----------|-------------|--------------|-------------|-------------|-------------|--------------|---------------|-------------|-------------|
| Systems           | 2         | I<br>3      | 2<br>4       | I<br>3<br>5 | 2<br>4<br>6 | 3<br>5<br>7 | 4<br>6<br>8  | 3<br>5<br>7   | 2<br>4<br>6 | I<br>3<br>5 |

The numbers following the chemical symbols are the atomic numbers of the elements, and those below represent the multiplicities of the systems of terms which have been found to combine in the production of the actual spectra. Elements in the same column of the table have similar multiplicities.

The displacement law states that, when an element is ionised, the enhanced series take on the same type of complexity as the arc series produced by the element to the left (*i.e.*, in the preceding column) in the periodic table. This has been verified for a considerable number of elements and is probably true for all. The same rule applies also to the spectrum of an element at successively higher stages of ionisation. As a result Mg II, Al III and Si IV, for example, all yield spectra of the same type as that of Na I, only one valence electron being left in each case; these spectra only differ in the displacement of corresponding lines to shorter wave-lengths and in the wider separation of corresponding pairs as the degree of ionisation is greater. Continued observations of this kind may be expected to contribute largely to our knowledge of the structure of atoms.

Suggestion as to the arrangement of electronic orbits in a large number of elements, based upon spectroscopic data, have been made by N. Bohr,<sup>2</sup> and important modifications of Bohr's scheme have been proposed by E. C. Stoner.<sup>3</sup>

*Band Spectra.*—A typical band consists of a large number of faint lines, which become especially crowded towards the "head," where the intensity appears greatest. Groups of such bands frequently occur, partially overlapping, and there may be several groups in the same spectrum, so that a band spectrum may include thousands of component lines. In each band it is usually possible to pick out a number of regular sequences of lines, each of which may be approximately represented by a Deslandres' formula  $\nu = A + Bm + Cm^2$ , where A, B, C are constants calculated from the lines and  $m$  is the number of a line counted from a suitable starting point. The heads of the bands may be represented by a formula of the same type.

The theory of band spectra, on quantum principles, has lately been greatly advanced. It is supposed that in a molecule the total energy is the summation of the energies due to rotation of the molecule as a whole, to vibrations of the atomic nuclei and to move-

ments of the electrons within the molecule. If a change occurs in one or more of these, the total energy will be changed and, exactly as in line spectra, the difference will be radiated as a single quantum. The complexity of a band spectrum is thus due to the great variety of possible states of the molecules by which it is emitted (see Sommerfeld, *op. cit.*, chap. VII.).

*The Solar Spectrum.*—A striking feature of continued work on the solar spectrum is the identification of a large number of faint lines with lines composing the bands of certain compounds, in addition to the band lines of carbon and cyanogen previously recognised by Rowland and Lockyer. The peculiarities of the region about the G group of Fraunhofer have been shown by H. F. Newall<sup>4</sup> to be due to the absorption of the well-known hydrocarbon band  $\lambda 4315$ , and the group P has been found by A. Fowler and C. L. L. Gregory<sup>5</sup> to include the strong ultra-violet band of ammonia having its maximum near  $\lambda 3360$ . In addition, the band of luminous water vapour beginning at  $\lambda 3064$  has been found by Fowler<sup>6</sup> to be present in the solar spectrum. A large number of previously unknown solar lines have thus been accounted for, and it is not improbable that the thousands of faint lines which remain unidentified may eventually be traced to other band spectra.

*Stellar Spectroscopy.*—Our detailed knowledge of the spectra of the stars has been greatly advanced by the use of the large telescopes which have been erected, and considerable progress has also been made in the interpretation of the stellar lines through experiments in the laboratory. In particular, the use of stronger discharges than had previously been employed has led to the discovery of new lines of several elements, which have been identified with lines occurring in the hotter stars. Certain lines of the Wolf-Rayet stars, for example, have thus been traced to carbon by T. R. Merton,<sup>7</sup> and others to oxygen by A. Fowler and J. Brooksbank.<sup>8</sup> The general outcome of the experimental reproduction of stellar lines is to support the view that the order in which the different classes of stars had been arranged is a true temperature sequence. This order, previously indicated by Secchi and Vogel, is now generally expressed by the classification introduced at Harvard by E. C. Pickering, in which the most important classes, passing from the white to the redder stars, are designated by the letters B, A, F, G, K, M.<sup>9</sup> On passing from the relatively cool M stars to the hot B stars, it is necessary, in accordance with the work of Lockyer, to employ a gradually increasing stimulus in order to excite the spectra which appear at successive stages of the stellar sequence.

The theory of thermal ionisation has been further developed by R. H. Fowler and E. A. Milne<sup>10</sup> with important results.

<sup>9</sup> The work of H. N. Russell, in general agreement with that of Lockyer, renders it probable that the true sequence is from M to B with increasing temperature, and thence from B to M with decreasing temperature, the density increasing throughout. Stars of rising temperature, on account of their great volume, have been called "giants," those of falling temperature "dwarfs." Differences between the spectra of giants and dwarfs of the same spectral class have been found by Adams (see *Monthly Notices R.A.S.*, vol. 81, p. 334) (1921).

glass prism and, after refraction and dispersion, is received on a distant white screen.

The name is firmly established for the orderly array of coloured lines, each corresponding to a single component, seen when a sample of light to be analysed has passed through a very narrow slit of a suitable spectroscope. "Spectrum," is used in an extended sense to cover the whole range of rays studied by methods capable of detecting not only visible rays but also ultra-red and ultra-violet rays, wireless waves, X-rays and  $\gamma$ -rays (see RAYS).

*Ultra-violet Rays.*—The existence of ultra-violet rays was discovered in 1801 by Ritter, who found that silver chloride was blackened by rays more refrangible than the utmost limits of the visible rays of the spectrum. The ultra-violet rays were examined in detail by Stokes in 1852 by the use of fluorescent substances to which attention had been called by Sir John Herschel in 1845 in researches on what he termed the "epipolic dispersion of light" by solutions of quinine. Stokes found that quartz prisms and lenses were far more transparent to ultra-violet light than glass, and that they revealed the existence of an invisible region extending as far beyond that previously known as the latter extends beyond the visible spectrum, and exhibiting a continuation of the Fraunhofer lines. He obtained evidence that the limit of the solar spectrum in the more refrangible direction had been reached; for the arrangement which revealed by means of fluorescence the existence of what were evidently rays of higher refrangibility coming from electric sparks failed to show anything of the kind when applied to the solar spectrum.

*Measurement of Wavelengths.*—On the undulatory theory of light, wavelengths can be assigned to rays of every degree of refrangibility by the use of diffraction gratings. A grating is a plate, of glass or of speculum metal worked plane (or concave) and highly polished, and on it fine straight parallel lines are ruled very close together at very regular minute intervals. Thomas Young in 1802 describes the use of a grating ruled on glass with 500 lines to the inch; and, in his developments of the undulatory theory and of the principle of interference, he deduced rough values of the average wavelengths of the various colours. Modern gratings are ruled with 10,000 to 20,000 lines to the inch. They serve admirably for optical work of high precision. But when we have to deal with very short wavelengths such as have been discovered in the last 30 years, a spacing of lines comparable in closeness with the spacing of atoms in solid substances is required.

*Ångström Unit.*—Wavelengths are measured in terms of a unit known as an Ångström unit (A.U.) or tenth-metre. Such a unit is  $\frac{1}{10,000,000,000}$ th of a metre =  $\frac{1}{10^{10}}$ m =  $\frac{1}{10^8}$ cm. The visible parts of the spectrum extend from about 3,900 A.U. to 7,600 A.U., nearly an octave in the musical sense of the word.

In terms of these units, Stokes would seem to have seen lines as far as 1,900 A.U. in the spectra of electric sparks between terminals of metallic lead. With fluorite prisms and lenses (in rarefied hydrogen to avoid the absorption due to air) Schumann photographed spectra extending to 1,000 A.U.; Lyman has reached 600 A.U.; and Millikan has penetrated as far as 200 Ångström units.

*Ultra-red Rays.*—Rays of invisible heat were discovered by William Herschel in 1801 in the ultra-red region.<sup>1</sup> Langley in 1886 traced, by the use of the bolometer, rays of radiant heat as far as wavelength 182,000 A.U. and Rubens penetrated as far as 610,000 Ångström units.

Thus our knowledge of the spectrum extends from 200 to 610,000 A.U., of which only the region between 3,900 and 7,600 A.U. is visible to the eye as light. (See RAYS.)

*Maxwell's Theory.*—In 1861-5 Maxwell developed, out of the physical conceptions of Faraday, his dynamical theory of the electromagnetic field. He gave reasons for believing that any change in the electrification of a conductor or in the magneti-

<sup>1</sup>This region is very frequently called the infra-red region, and its rays the infra-red rays (see RAYS).

sation of a body is accompanied by the propagation of corresponding disturbances through the surrounding medium. His equations showed that the rate of propagation should be expressed by the same number which expresses the number of electrostatic units in one electromagnetic unit. The comparison of available measures of these electrical quantities gave a number corresponding with the velocity of light. Maxwell adds:—

At the outset of this paper, the dynamical theory of the electromagnetic field borrowed from the undulatory theory of light the use of its luminiferous medium. It now restores the medium after having tested its power of transmitting undulations and the character of those undulations, and certifies that the vibrations are transverse and that the velocity is that of light. What then is light according to the electromagnetic theory? It consists of alternate and opposite rapidly recurring transverse magnetic disturbances accompanied with electric displacements, the direction of the electric displacement being at right angles to the magnetic disturbance, and both at right angles to the direction of the ray.

*Lodge and Hertz.*—In 1887-8 Oliver Lodge and Hertz were, each unknown to the other, running a neck-to-neck race, to crown Maxwell's achievement by devising experimental methods of producing and detecting electro-magnetic waves of very high frequency—about 100,000,000 per sec.—very high in comparison with those in common use in ordinary electrical experiments, but very low in comparison with those attained in Langley's examination of the ultra-red parts of the prismatic spectrum. Hertz succeeded in measuring, within the walls of his laboratory, the wavelengths of the periodic disturbances emitted by the spark-discharge of an electric condenser. And from these pioneering experiments the whole system of wireless telegraphy (*q.v.*) has been evolved by the inventive genius of many workers. The wavelengths of Hertzian or wireless waves range from a few hundred metres to long waves of about five km. and more.

*X-rays (q.v.).*—The X-rays discovered by Röntgen in 1895 are now known to be identical in nature with light but to be of exceedingly small wavelengths. A. Laue in 1912 made a fundamental discovery when he passed X-rays through crystals and found evidence which at one and the same time disclosed the orderly atomic structure of such bodies and the undulatory nature of X-rays. W. L. Bragg in 1913 discovered that X-rays could be reflected by the cleavage planes of crystals at nearly glancing incidence; and he and his father Sir W. H. Bragg devised the X-ray spectrometer, by means of which they measured the wavelengths of specially selected X-rays and studied the structure of crystals. Their methods were applicable both to the electrical detection of the rays and to photographic records of the "spectral lines" of such characteristic rays of the elements as were discovered by Barkla in 1904. The tactical array of the atoms in a crystal serves the same sort of purpose as the systematic spacing of lines on an optical grating and wavelengths as small as 1 A.U. were measured (see CRYSTALLOGRAPHY).

Moseley in 1913 discovered that in the high frequency spectra of the elements a wonderful progressive increase of wavelengths of homologous lines was disclosed by the elements when arranged in order of atomic weight (see ATOMIC WEIGHTS); and theoretical considerations led him in 1914 to prove by measurement of photographic records that (1) every element from aluminium to gold is characterised by an integer which determines its X-ray spectrum, and (2) this integer *N*, the "atomic number" of the element is identified with the number of positive units of electricity contained in the atomic nucleus (see ISOTOPES).

He thus corroborated the conceptions of Rutherford (1911) and of van den Broek (1913) of the nature of this constituent of an atom, and, besides establishing a fundamental principle in atomic physics, provided measures of wavelengths in the extreme regions of the ultra-violet spectrum.

X-rays used in physics and medicine range from about 0.01 A.U. to 12 Ångström units. The highly penetrating rays are of short wavelength; the "softness" of rays increases with the wavelength. The  $\gamma$ -rays emitted by radioactive substances are highly penetrating rays and have wavelengths less than 1.5 Ångström units. The recent observations of Millikan in 1925 on

a very highly penetrating radiation point to the existence of X-rays of wave-lengths even smaller than those of  $\gamma$ -rays.

Thus our knowledge of the spectrum of electromagnetic radiations may be said to extend over a range of more than 70 octaves, or from wavelengths from 0.001 A.U. to 10,000 km.; and within this range the visible rays occupy hardly an octave; the British Broadcasting Company utilise rays ranging over about 2 octaves; and only about 5 octaves in the whole range have escaped actual detection (see WIRELESS). See E. C. C. Baly, *Spectroscopy* (1924). (H. F. N.)

**SPEE, MAXIMILIAN**, COUNT VON (1861–1914), German sailor, was born in Copenhagen June 22 1861. He entered the German navy in 1878 and from 1887 to 1888 was Hafenkommandant (commander of the port) in German Cameroon. In 1908 he was made chief of staff of the German North Sea command, and at the end of 1912 took over the Far Eastern Squadron. On Nov. 1 1914 he was engaged by Admiral Cradock off Coronel, on the Chilean Coast, and succeeded in defeating the British squadron. On Dec. 8 1914, however, he was attacked by Admiral Sturdee's cruiser squadron. The Germans were heavily defeated in the battle that took place. This is usually known as the battle of the Falkland Islands, and in it Spee himself went down with his flagship, the "Scharnhorst." (See CORNEL; FALKLAND ISLANDS).

**SPEED INDICATOR**.—Instruments used for measuring either linear or angular speed are classed under the general heading of speed indicators. Those used for indicating linear speed are used most extensively on motor vehicles and are known specifically as speedometers, while instruments based on the same working principles but used to measure angular speed are known as tachometers. Tachometers are always graduated in revolutions per minute, while speedometers are graduated in miles (or kilometres) per hour.

The speedometer is driven from one of the road wheels or from the transmission tail shaft of the vehicle through a flexible shaft and a gear mechanism, and as its indications depend solely upon the speed at which its own shaft revolves, account must be taken in calibrating it, of the diameter of the road wheel from which it is driven and of the gear ratio between this wheel and the speedometer shaft. Inversely, if the scale is fixed, the gear ratio must be varied to suit the wheel diameter.

**Odometers**.—Speedometers used on automobiles carry, in addition to the actual speedometer mechanism, a so-called odometer, which indicates the distance covered by the car. This instrument comprises a number of dial wheels with numerals imprinted on their circumference, which show through a window in the face plate. The dial wheels do not move continuously but periodically, in steps of one-tenth revolution. Usually there are two sets of such dial wheels, one set showing the total mileage covered by the car since the instrument was installed, the other the mileage covered on a single trip, the dials of the latter being returnable to the zero position at the end of each trip by means of a reset device. An odometer, therefore, may be regarded as an integrator of linear motion; a corresponding instrument for integrating angular motion is known as a revolution counter and is much used on large, low-speed engines, in mechanical tests, and for many other purposes.

**Main Principles**.—There are three general principles on which the operation of speed indicators may be based, of which that of centrifugal force has been employed longest. With this, a pair of weights is carried on a revolving shaft, in such a manner that they may move out from the axis of the shaft under the influence of centrifugal force, while being forced toward the axis of the shaft by a spring, the motion taking place around fixed pivots. The centrifugal force on the weights increases with the speed, and the faster the shaft revolves, the farther the weights will move out from the axis of rotation. An indicating hand connected mechanically to the centrifugal weights may be made to indicate the speed of rotation of the shaft, or the speed of motion of a vehicle to one of whose road wheels the shaft is connected.

The second principle very extensively used is that of magnetic drag. A cup of sheet aluminium is mounted on a spindle and

held in the "zero" position by a spiral spring. A permanent magnet whose lines of force pass through the wall of the cup is rotated inside the latter at a speed proportional to that to be measured. The rotation of the magnet induces currents in the aluminium cup and the reaction between these currents and the magnetism of the magnet produces a drag on the cup, which causes it to turn around its axis against the torsion of the spring, in proportion to the speed of the magnet. A scale printed on the outside of the cup shows through an opening in the face of the instrument, and the scale reading in line with a mark on the face indicates the speed.

The third principle made use of is based on the fact that speed is the quotient of distance by time. Instruments based on this principle comprise an odometer and a clockwork, measuring distance and time respectively, and they effect the operation of division mechanically. (P. M. H.)

**SPENDER, JOHN ALFRED** (1862– ), British journalist, was born at Bath, the son of a doctor, and educated at Bath College, and at Balliol College, Oxford, under Jowett. Adopting the career of a journalist, he was editor of *The Eastern Morning News* from 1886 to 1890, after which he came to London and was on the staff of *The Pall Mall Gazette*. When the *Westminster Gazette* was established in 1893, he became an assistant editor and from 1896 to 1922 was its editor, leaving just after it became a morning paper. As editor of the *Westminster* Mr. Spender won general respect, not only as a brilliant writer but as the possessor of an exceptionally fair and balanced mind. He won, too, a high place in the councils of the Liberal party, and his services to the state included membership of the royal commission on divorce, and of the Milner Mission to Egypt. A slight volume, *The Comments of Bagshot* (1914), reveals Mr. Spender at his best. He has also written *The Indian Scene* (1912); *The Foundations of British Policy* (1917); and *The Life of Sir. H. Campbell-Bannerman* (1923). His brother, Harold, also known as a Liberal journalist, and the author of a number of books of travel and politics, died April 15 1926.

**SPENGLER, OSWALD** (1880– ), German philosopher, was born at Blankenburg in the Harz May 29 1880. He studied mathematics and natural history at various German universities, and at the same time interested himself deeply in history and art. This early and rare combination of scientific knowledge with interest in the humanities is the foundation of the peculiar character of Spengler's work, in which unexpected parallels between scientific truths of physics and mathematics and the artistic and other cultural achievements of an epoch of history are made clear. Spengler's thesis for his doctor's degree dealt with "The Metaphysical Idea of the Philosophy of Heraclitus" (Halle, 1904). From 1907 to 1911 he taught mathematics and physics at a school in Hamburg. In 1911 he conceived the main theme of his work. Abandoning teaching, he completed in 1914 the first version of *Der Untergang des Abendlandes*, which remained unpublished until 1918. A revised and much enlarged edition was completed in 1922. An authorised translation of the first volume into English (*The Decline of the West*), by Charles Francis Atkinson, was published in 1926. The work has had great popularity and influence.

Other works of Spengler, chiefly concerned with contemporary political problems are: *Preussentum und Sozialismus* (1920); *Pessimismus* (1921); *Politische Pflichten der deutschen Jugend* (1924); *Neubau des deutschen Reiches* (1924).

See M. Schroeter, *Der Streik um Spengler*, etc. (1922).

**SPERRY, ELMER AMBROSE** (1860– ), American inventor, was born at Cortland, N.Y., Oct. 12 1860. His education was received at Cortland normal school, 1876–9, and Cornell University, 1879–80. He founded the Sperry Electric Co., Chicago, in 1880, engaging in the manufacture of arc lamps, dynamos and other electrical appliances, and also the Sperry Electric Co., Cleveland, O., manufacturers of electric cars. This last-named company was sold to the General Electric Co., New York City, in 1894. He perfected one of the first arc lamps, and invented aeroplane and ship stabilisers, the highest intensity searchlight (1,500 million candle power), and many special devices for the U.S. Navy. His most important invention was the gyro-compass

(patented in 1918), designed to obviate magnetic disturbances incident particularly to armoured ships and submarines. He further devised the gyro-pilot, a device for the automatic steering of a ship. In 1910 he became president of the Sperry Gyroscope Co., Brooklyn, N.Y., a company formed to manufacture his inventions. In 1915 he became a member of the Naval Consulting Board and chairman of its mines, torpedoes and aeronautics committees. In 1883 he erected the highest electric beacon in the world on Lake Michigan (350 feet).

**SPIELHAGEN, FRIEDRICH VON** (1829-1911), German novelist (see 25.667), died at Charlottenburg, Berlin, Feb. 25 1911.

**SPINAL MENINGITIS** (see 18.130).—The term meningitis signifies merely an inflammation of the membranes (meninges) surrounding the brain and spinal cord. An equivalent term is cerebro-spinal meningitis. As the inflammation is usually incited by microbes and attended by fever it is also called cerebro-spinal fever.

The meninges, as is the case also with the corresponding membranes of the chest (pleura), heart (pericardium) and abdomen (peritoneum), are subject to infection with quite a wide variety of bacteria—cocci and bacilli. According to the microbic incitant, the infection is termed tubercular, pneumococcal, streptococcal, staphylococcal, influenzal (*B. Pfeifferi*), typhoid, etc., meningitis. The precise diagnosis of one or another of these varieties is accomplished by means of the bacteriological examination of fluid (cerebro-spinal) withdrawn by means of the device known as lumbar puncture. The above-mentioned class of bacterial infections of the meninges tends to arise exceptionally or sporadically; as a rule it accompanies the corresponding bacterial infection affecting other parts of the body, the lungs, middle ear, tonsils, etc.

**Epidemic Form.**—In sharp contrast with the sporadic varieties of meningitis is the epidemic form, incited by a particular micro-organism, the diplococcus discovered by Weichselbaum in 1887, now called meningococcus, of which many epidemic outbreaks have been recorded in medical literature. The meningococcus possesses biological characteristics which serve readily to distinguish it from other members of the large class of cocci; and it appears not as a single, sharply defined species, but rather as a group in which the composing strains, while showing many properties in general, are yet distinguishable by means of physiological differences, as of power to ferment carbohydrates, reaction to specific agglutinating agents, etc.

As with other such disease-producing or pathogenic bacterial groups, e.g., pneumococci, certain strains or types of meningococci have greater virulence for man than have others. The more virulent strains show greater fixity of biological properties than the more fluctuant, less virulent ones. During epidemics of meningitis the types of enhanced pathogenicity have the wider distribution; while in interepidemic periods the weaker, less defined strains are more frequently encountered.

A very wide epidemic, so-called pandemic, of meningitis prevailed during the first two decades of the present century. It embraced Europe, America, Asia, Africa and many islands of the seas. This pandemic was characterised by high mortality and by those multiple clinical features which have been noted in previous severe epidemics of the disease. A part only of the cases, usually not a large part, was attended by the visible haemorrhages in the skin and mucous membranes to which the name of spotted fever was applied in earlier times. Usually the very severe and rapidly fatal so-called fulminating cases fell into this category.

The fatality of the epidemic outbreaks, whether in Europe, in America or in more distant countries, in the years between 1904 and 1910 did not vary greatly. In the United States the percentage figures were from 75 to 90; in Great Britain 70 to 80; in Germany 60 to 70; in France, Italy and Belgium 75 to 80; in Palestine 80; in Greece 60; in the Transvaal 75. In other words, the pandemic seems to have been little affected by locality or race. As in all previous epidemics closely observed, the mortality was influenced by the age period of the attacked; the very young and the very old rarely survived attack. On the

other hand, children over five and adults up to 30 years of age have the best chance of recovery.

**Serum Treatment.**—The outlook for recovery has been greatly modified by the discovery and use of the antimeningococcal serum, or as it is now called merely antimeningitis serum. In view of the advance of bacteriology and serum therapy, it was natural and inevitable that with the reappearance in force about 1904 of epidemic meningitis, efforts should be made to produce a curative serum. These attempts were carried out simultaneously in Germany by Jochmann and Wassermann, and in America by Flexner. The former failed perhaps because the manner of use was wrong: the serum was injected chiefly subcutaneously. The latter succeeded, because the injections were made repeatedly directly into the inflamed meninges by means of lumbar puncture. Flexner's method was based on an experimental study in which the meninges of monkeys were infected with the meningococcus, and the treatment was applied by lumbar puncture. The serum-treated monkeys survived, while the untreated and those treated by subcutaneous injections of the serum succumbed.

This result is in harmony with what is known of the anatomical-physiological conditions affecting the passage of chemical substances from the blood into the cerebro-spinal fluid. Such passage, even when the membranes are inflamed, takes place to a very small extent or not at all. In order, therefore, to bring the curative serum into relation with the seat of disease, it became necessary to circumvent the protective mechanism of the choroid plexus, which structure determines the quality of the cerebro-spinal fluid. This could readily be done by making direct injections through the lumbar puncture needle.

**Results of Serum Treatment.**—The consensus of competent opinion is that given a potent antimeningitis serum, which carries the immunity principles of the chief strains of virulent meningococci—a so-called polyvalent serum—its proper employment is capable of greatly modifying the course of the meningitic disease, of reducing the mortality, and of preventing crippling consequences. The results of the serum treatment are affected by such considerations as age of the patient, period of the disease at which the treatment is begun, the manner in which the repeated injections are carried out and also of course by the original severity of the cases themselves. Little has been accomplished in mitigating the effects of the fulminating disease, since often the interval between onset and termination is only 24 to 48 hours.

A number of tabulations have been published showing the effects of the serum according to age groups, days of first injection, etc. The largest compilation is that of Flexner, dealing with about 1,300 cases in which the mortality among those treated in the first three days of illness was 18.1, the second three days 27.2 and after the seventh day 36.5%. The total mortality among these cases was 30.8%, as compared with 75 to 80% among corresponding non-serum-treated cases. Netter's figures for the corresponding three periods are 7.14, 11.1 and 23.5%; and Dopfer's 8, 20, 14.4 and 24.1%. Flexner's figures are compiled from the reports of physicians at many places, of whom not a few had had only slight experience with the serum, while Netter's and Dopfer's are based on personal experiences largely with a more uniform material and method. Similarly, the influence of age on the results of the treatment is shown as follows: According to Flexner, under one year 50%, one to 20 years 75%; over 20 years 60% recovered; according to Netter, under one year 40%, one to 20 years 79% recovered; and according to Dopfer, under one year 53%, one to 20 years 78%, and over 20 years 76% recovered. These are impressive figures when compared with those of earlier epidemics, and especially with corresponding and even simultaneous cases of the same epidemics in which the antimeningitis serum was not employed.

It is desirable to ascertain whether the favourable action of the serum can be related to any other striking results of its use. In this way the mere numerical or statistical evidence may come to be supported. Fortunately, certain important objective effects are produced. Perhaps the most immediately impressive

is the modified character of the clinical course of the disease itself. Briefly stated, this relates to the essential disappearance of the chronic cases slowly moving through weeks and months to a fatal issue, attended by hydrocephalus, extreme emaciation and other sequels. Either the cases fail to respond and terminate quickly, or in a few days the real infection is over and the patient convalescent. The growth and multiplication of the meningococcus within the cerebro-spinal fluid are quickly arrested. Probably it is this action of the serum which controls the disease. Next, epidemic meningitis is a disease from which when recovery occurs spontaneously it tends to take place slowly, gradually, or by "lysis"; under the influence of the serum, sudden termination by "crisis" frequently takes place. Finally, the severe consequences, as of hydrocephalus, impairment of vision and mentality, paralysis and joint affections, are diminished. The one severe complication which has not been influenced is deafness, which occurs in a varying, usually small percentage of the cases, and usually very early in the disease.

**Mode of Infection.**—The mode of infection in epidemic meningitis may be regarded as established. The meningococcus gains access to the interior of the body by way of the mucous membrane of the nose and throat. The incidence of meningitis bears relationship to the proportion of nasopharyngeal carriers of the meningococcus. When the cases are few in any community or group of persons the carrier rate is low. When the carrier rate rises the cases tend to increase in number. During sharp outbreaks, among an exposed personnel, the carrier rate may reach 20%; ordinarily it is 2 to 3% or less.

Probably the meningococcus passes from the nasal mucous membrane into the blood, with which it is carried to the meninges. Whether the microbe ever passes along the direct lymphatic channels stretching from the nasal membrane to the meninges may be doubted. Instances are known in which meningococci were present in the blood some time before signs of meningitis appeared. The intravenous injection of the antimeningitis serum has been successful in removing the microbe from the blood and of curing the general or blood infection. No meningitis followed. It is because of the occurrence of meningococci in the blood stream that early intravenous injection of the serum is recommended by certain authorities as a regular part of its intraspinal use in the treatment of epidemic meningitis. To be of value, the intravenous injection should be carried out very early in the disease, and it should not be substituted for the direct injection into the inflamed meninges. As a rule, a number of intraspinal serum injections on successive days is required to control the infection.

The successful employment of the antimeningococcus serum has led to efforts being made to control other microbic varieties of meningitis in a similar manner, but thus far without notable success. Probably the meningococcus, as compared with the more hardy pneumococcus, streptococcus and Pfeiffer bacillus, is a fragile organism easily subject to injury by direct action of the antiserum. Certainly it tends to be taken up by the white blood cells (leucocytes) present as the result of inflammation. It is this striking intracellular feature which led Weichselbaum, the discoverer, to invent for it the cumbrous name of *Diplococcus intracellularis meningitidis*, now rarely employed. Moreover, with so many of the class of microbes other than the meningococcus, the meningitis is a complication of some other severe infection, as a pneumonia, a peritonitis or other severe affection, so that its amelioration offers fewer possibilities of successful issue than when, as in epidemic meningitis, the chief if not the sole disease is confined to one place. Even with the antimeningitis serum, the natural curative powers of the body come into play, when the recovery of one and not of another individual occurs and there are relatively comparable conditions of infection. Hence, the more seriously embarrassed the body is with multiple sources of microbic poisoning, the less able are these inherent powers to assert themselves, even when assisted by artificially produced healing agents.

**SPITSBERGEN**, the Arctic archipelago between Greenland and Novaya Zemlya (see 25,708), is now officially known as Svalbard, though the individual islands retain their former names. According to the most recent surveys, the highest peak in the archipelago is believed to be Mount Newton, 5,445 ft., in the eastern part known as New Friesland. Several other peaks in the same and near ranges are over 5,000 feet. Mount Eidsvoll, in King James Land, is 4,770 ft. and Mount Monaco, on Prince Charles Foreland, is 3,543 feet.

**Geology.**—Considerable exploration has not greatly modified the main conception of the geological structure, but it is now realised that the Caledonian folds of Scotland and Scandinavia pass through Prince Charles Foreland and western Spitsbergen and are probably continued in the north of Greenland. The old rocks of the west, generally described as the Hekla Hook series, seem to be of Ordovician age to which may also be ascribed most of the so-called Archaean rocks of the northwest. There are no permo-carboniferous rocks in King James Land and the strips of rocks on the northeast side of Prince Charles Foreland and the opposite shores of the mainland, formerly attributed to that age, are now known to be tertiary. Certain of the coal measures in Advent Bay prove to be of cretaceous and not tertiary age and these cretaceous beds probably appear also below the tertiary beds in Lowe Sound. An extinct volcano and several hot springs with a temperature of 75° to 82° F. were discovered in Bock Bay, off Wood Bay in 1910. The volcano seems to date from a later period than any other volcanic manifestation found in Spitsbergen. Research has proved that dislocation has played a great part in determining the main features of the fjord system, especially in Ice Fjord where the course of the Fjord has been decided by great faults.

**Climate.**—From the meteorological data now available, including eight years' records from Green Harbour, the following means may be given:

Cape Thorsden.—Jan.+0.3° F., July 39.9° F.;  
Green Harbour.—Feb.-8.3°, July 39.7°;  
Axel I. (Lowe Sound)—Feb.-7.2°, July 40.3°;  
S.E. of Edge I.—Feb.+0.3°, Aug. 37.4°;  
Bear I.—Feb.+10.4°, Aug. 40.1°.

The mean annual precipitation at Green Harbour is 11.6 in.; Prince Charles Foreland has more and the interior of Spitsbergen less.

**Exploration.**—Recent exploration in Spitsbergen has been devoted mainly to geological work, largely with economic ends in view, and detailed cartographical survey.

The principal survey work has been done by Norwegians working in small parties every summer since 1906, assisted by grants from the Norwegian State. These parties have been successively commanded by G. Isachsen, A. Staxrud and A. Hoel, and have mapped in detail the western side of the mainland from the north coast to the South Cape. The work is expedited by the use of photogrammetric methods to assist triangulation. The detailed survey of Prince Charles Foreland was completed by W. S. Bruce and assistants, who also mapped the area between Klaas Billen and Sassen Bays. Swedish surveyors mapped the land round Lowe Sound and Braganza Bay. The Prince of Monaco showed continued interest in Spitsbergen exploration by giving assistance to several explorers, including the Swiss, H. Stoll, who in 1913 crossed the unknown country between Lowe Sound and Agardh Bay.

W. Filchner in 1910 surveyed the glaciated region between Temple Bay and Mohn Bay. Another German expedition under Lt. Schroeder-Stranz in 1912 came to grief on the north coast, with some loss of life, and accomplished nothing. In 1920 J. M. Wordie scaled several of the highest peaks on the west coast, including Mounts Monaco, Rudmose and Barents. In 1923 and 1924 the Oxford expeditions under G. Binney carried out some surveys on the coasts of North-East land and crossed the island. Hydrographic surveys have been carried out by G. Isachsen and others on the west coast and in Green Harbour, by W. S. Bruce in Foreland Sound, Klaas Billen and Sassen Bays and Stor Fjord, and by the Norwegian naval survey in Ice Fjord and on the southwest coast. Swedish Govt. surveyors have been at work in Lowe Sound. Oceanographical work has been done in Spitsbergen waters by Dr. F. Nansen. King's Bay was used by R. Amundsen in 1925 in his unsuccessful attempt to fly to the Pole and again in 1926. The Norwegian Govt. has maintained a wireless telegraph station and meteorological observatory in Green Harbour since 1911. A German meteorological station was founded in Ebeltoft Haven, Cross Bay, in 1910 as the outcome of a visit by Prince Henry of Prussia and Count Zeppelin, when experiments with dirigible balloons were conducted. This station was abandoned in Sept. 1914. From 1920-6 Norway maintained a meteorological and geophysical station for aerological and geo-

magnetic research at Quade Hook, King's Bay. In Aug. 1921 a Norwegian Church was consecrated at Longyear City. There are Norwegian post-offices at the chief mines.

**Mining.**—The development of the coal-fields has proceeded rapidly, greatly stimulated during the War by the scarcity and high price of coal in Scandinavia. The coal-mine in Longyear Valley, Advent Bay, which has been under American ownership since 1905, was sold in 1916 to Norwegians. Several other Norwegian mines have started, notably in King's Bay and Hjorth Haven in Advent Bay and on Bear Island. Swedish mines were opened in Lowe Sound (Braganza Bay) in 1917. There are Dutch mines in Green Harbour. British enterprise, hampered by war conditions, revived in 1919 in the coal bearing areas in Klaas Billen Bay, Temple Bay and Coles Bay. By 1920 practically all the coal-bearing areas were annexed by one or other company. In 1925 seven mines were exporting coal. The total amount of coal exported in 1924 was 440,000 tons, nearly all of which went to Norwegian ports, including some to Narvik for the Swedish railways. A few thousand tons went to Archangel. The coal exported so far is of Tertiary and Cretaceous age and proves to be good steam coal. Bituminous coal of Carboniferous age will soon be available for export. Mining continues throughout the year but the export season at present is from late May to September. The largest mining camp is Longyear City in Advent Bay, housing some 500 men in summer and 400 in winter. No other minerals besides coal are as yet exploited commercially, but large deposits of iron ore (36% iron) and gypsum are known, as well as smaller deposits of zinc and asbestos. Signs of oil have been reported. Whaling was revived in Spitsbergen waters in 1905 but after a few years was abandoned. Winter fur-hunting is pursued by a few Norwegians.

**Political History.**—The question of political control had been discussed since about 1870, mainly by Norway, Sweden and Russia, without any solution being found. Spitsbergen therefore occupied the curious position of being *terra nullius*. In 1907, however, Norway again opened negotiations for an international conference to decide the question of sovereignty, and one was held at Oslo (Christiania) in July-Aug. 1910, followed by another in 1912, without definite result. In July 1914 a conference which included also representatives of Britain, France, Belgium, the United States, Holland and Germany tried to devise a form of administration consistent with the country remaining a *terra nullius*, but the outbreak of the World War put an end to the discussions. In 1919 the Supreme Council conferred on Norway, the sovereignty of Spitsbergen, including Bear I., and all islands between 10° and 35° E., and between 74° and 81° North. The signatories of the treaty were Great Britain and the British Dominions, France, Italy, the United States, Japan, Holland, Denmark, Norway and Sweden. Ratifications were delayed and Norwegian sovereignty did not become effective until Aug. 1925. Russia has now adhered to the Treaty. The rights and territories of nationals other than those of Norway are safeguarded, and Norway is not allowed to show preferential treatment to Norwegian mining companies or to levy taxes except for expenditure on the administration. Disputed claims to estates are to be decided by a neutral commission presided over by a Dane. The islands are never to be used for warlike purposes. Svalbard is the new name for all islands in the Norwegian sphere in the Arctic but the names of individual islands are unchanged. Svalbard is deemed a part of the Kingdom of Norway.

**BIBLIOGRAPHY.**—The literature is in the main scattered in periodical publications, specially useful are *Ymer* (Stockholm) *Viden-skapsselskapets skrifter* (Oslo), *Naturen* (Bergen), *Scottish Geographical Magazine* and *Albert I.*, Prince of Monaco's *Résultats des campagnes scientifiques*, vol. 40, 41 and 45 (1889, etc.). Two modern works are R. N. Rudmose Brown, *Spitsbergen: its exploration, hunting and mineral riches* (1919) and F. Nansen, *Enferdt til Spitsbergen* (1920); or *Spitzbergen* (Leipzig, 1921). G. Isachsen, "Fra Ishavet" in *Det Norske Geografiske Selskabs Aarbok* (1916-9) gives much information about Norwegian hunters. H. M. Cadell, "Coal Mining in Spitsbergen," *Trans. Inst. Min. Eng.*, vol. 60 (1920) and A. Hoel, "The Coal Deposits and Coal Mining of Svalbard" (Oslo, 1925) describe the coal-bearing areas. F. C. Wieder, *The Dutch Discovery and*

*Mapping of Spitsbergen 1596-1829* (Amsterdam, 1919) has many reproductions of early maps. The meteorological observations at Green Harbour are published annually in *Jahrbuch des Norwegischen Meteorologischen Instituts* (Oslo). A. Miethe and H. Hergesell, *Mit Zeppelin nach Spitzbergen* (1911) is noteworthy for the excellence of its illustrations, including colour plates. G. Binney, *With Seaplane and Sledge in the Arctic* (1925) describes the work of the Oxford expeditions. Some of the results of the Norwegian surveys are collected in *Expedition Isachsen au Spitzberg 1909-10 Resultats scientifiques* (Oslo, 1916). The geomorphology of Spitsbergen is explained by G. de Geer "On the physiographical evolution of Spitsbergen" *Geog. Annaler*, vol. 1 (Stockholm, 1919). *Spitzbergen-Handbuch* (Berlin, 1916) gives full sailing directions. The Spitsbergen Treaty is published in Treaty Series No. 18, Cmd. 2092 (1924). (R. N. R. B.)

**SPITTA, FRIEDRICH** (1852-1924), German theologian (see 25.711), died at Göttingen June 7 1924. In 1910 he published *Das Johannes-Evangelium Als Quelle der Geschichte Jesu*.

**SPITTELER, CARL** (1845-1924), Swiss poet and novelist, known by his pen name of Felix Tandem, was born in Liestal, Switzerland, on April 24 1845. He was educated at the Basle Gymnase and studied theology at the universities of Zurich and Heidelberg. From 1871 to 1879 he acted as a tutor in Russia; from 1879 to 1880, he was a teacher at the Girls' High School, Berne, and afterwards at Neuenstadt. In 1885 he became editor of the *Grenzpost*, Basle, and in 1890-2 was fiction editor of the *Neue Züricher Zeitung*. In 1892 he settled down as an independent author at Lucerne. In 1919 he won the Nobel Prize for literature and the Prize of Honour of the Swiss Schiller Foundation. He died at Berne Dec. 29 1924.

His chief works are: *Prometheus und Epimetheus* (1881), an epic; *Extramundana*, a poem (1883); *Imago*, a romance (1906); *Schmetterlinge*, poems; *Friedli, der Kolderi*, a tale; *Gustav*, a tale; *Balladen*; *Conrad der Leutnant*, a tale; *Lachende Wahrheiten*, essays; *Olympischer Frühling*, an epic (1900-3); *Glockenlieder*, poems; *Die Mädchenfreunde*; *Meine frühesten, Erlebnisse* (1914); *Rede über Göttilfried Keller*, etc.

**SPOKANE, Wash., U.S.A.** (see 25.713), had a population in 1920 of 104,437 (of whom 17,096 were foreign born) and had grown by 1925 to about 125,000 within the city limits (local estimate). After the World War there was a lively period of activity in all kinds of construction (public, commercial, industrial and domestic buildings) amounting to an aggregate value of \$16,410,489 for the years 1919-24. The assessed value of taxable property in 1924 was \$86,549,924. Industrial development progressed until there were (1924) 364 establishments in or near the city, with an output for the year valued at \$125,000,000. Meat and other food products, lumber and lumber products, flour, machinery and paper were among the leading commodities produced. The wholesale and jobbing business for the same year was estimated at \$197,538,000. By 1925 there were seven hydro-electric plants on the Spokane river, within 30 m. of the city, which had an installed capacity of 185,400 H.P., supplying current in Spokane for the street railways, street lamps and domestic and industrial use. The commission form of government was adopted in 1911. In 1917 a comprehensive park system was laid out. By 1925 there were 2,200 ac. in public parks (the highest *per capita* provision in the country), including a mountain 5,808 ft. high, 35 m. away, owned by the city. Spokane had the lowest percentage of illiteracy and the highest percentage of school attendance among the cities of 100,000 and over in 1920.

**SPRAYING:** see ENTOMOLOGY, ECONOMIC.

**SPRINGFIELD, Mass., U.S.A.** (see 25.739), increased in population 45.8% in the decade beginning 1910, reaching 129,614 in 1920, of whom 31,461 were foreign born, and reaching 142,224 in 1925 (State census). The numerous and diversified manufactures within the city had an output valued at \$31,773,000 in 1909; \$98,333,000 in 1919; and, after only a slight decrease during the post-War depression, \$104,568,038 in 1923. In the industrial district, within five m. of the "municipal group," there were 543 plants in 1924 making 478 different products. In 1916 the Eastern States Exposition (agricultural and industrial) was established, with permanent grounds of 172 ac., in West Springfield; by 1924 plant and equipment were valued at \$2,000,000 and included a coliseum with an unobstructed arena 100 by

200 ft. and seating capacity for 5,600 persons. A new Union station was built in 1919. The Hampden County Memorial Bridge (concrete) across the Connecticut river, built in commemoration of the patriotic service of the county's citizens, was dedicated in 1922. Zoning ordinances were adopted in 1922-3-4.

**SPRING-RICE, SIR CECIL ARTHUR** (1859-1918), British diplomatist, was born in London Feb. 27 1859, the second son of the Hon. Charles Spring-Rice (1819-1870), and grandson of the 1st Baron Monteagle. Educated at Eton and Balliol College, Oxford, he entered the Foreign Office in 1882, becoming private secretary to Lord Granville in 1884 and précis writer to Lord Rosebery in 1885. He went to Washington as third secretary in 1886, and in 1895 proceeded to Berlin. In 1898 he became secretary at Tehran, and in 1901 British commissioner on the Caisse de la Dette in Cairo. In 1903 he went to St. Petersburg (Leninград), first as secretary and later as councillor of embassy, remaining in Russia till the end of 1905. In 1906 he was sent to Persia as minister, having lately been created K.C.M.G. In 1908 he was created G.C.V.O. and went to Sweden as minister, and in 1912 was appointed ambassador to the United States. He died at Ottawa on his way home to England, Feb. 14 1918. See Sir V. Chirol, *Cecil Spring-Rice: In Memoriam* (1919).

**SPRUE.**—Sprue (*see* 25, 742) (Dutch Spruw) is fairly distributed in tropical and subtropical regions, and it is impossible to affirm positively that cases do not arise in temperate climates.

**Symptoms.**—The symptoms usually begin with dyspepsia and irregularity of bowel action. In a fully declared case the chief signs are the passage of large, bulky, frothy, pale porridge-like, fermenting stools, especially in the early part of the day, much flatulence and acidity, with a sore, tender, ulcerated mouth, a red, smooth and tender tongue, often with exquisitely painful ulcers on the frænum and at the sides where the tongue comes into contact with the back teeth. Loss of flesh is very rapid amounting perhaps to 40 lb. in two months. Cramps of the fingers and of the feet and calves identical with those of tetany, are common in severe cases and death occurs either from emaciation, exhaustion and intercurrent disease or, more usually, from intense anaemia, with signs resembling in some respects, but not in all, those of pernicious anaemia (*q.v.*), or rarely from perforation of the intestinal ulcer, since the alimentary tract may show ulcers similar to those present in the mouth.

**Causation.**—An early and persistent symptom is intestinal disturbance, due, it may be, to the growth and products (toxins) of streptococci isolated from the stools and mouth lesions or to fungoid organisms, monilia or as a sequela of dysentery, though many suffer from dysentery who never develop sprue, and many sprue patients have never had dysentery. It has been ascribed to food deficiency or avitaminosis, but sprue attacks mostly the European in good circumstances, not the native, underfed and living in unhygienic surroundings.

Recent investigations tend to regard sprue as due to disturbance of the parathyroid glands which are closely associated with the thyroid and seem to have a two-fold function, (1) to exert an anti-toxic action, especially against intestinal poisons and (2) to regulate the metabolism of calcium. In sprue the primary mischief appears to be the production of intestinal toxins, a condition very common in tropical and subtropical regions, and arising from one or more causes as noted above. The parathyroids perform their detoxicating function until exhausted and no longer able to cope with the poisons elaborated. Determination of the calcium content of the blood at this time yields definite indications of upset of calcium metabolism. In normal blood plasma calcium exists in two forms, the ionic, or free, and the coagulative, or combined, and present in the proportions of 6 ionic to 4-5 of combined. When the blood coagulates, the calcium of the serum of normal subjects is all in the ionic form. In sprue, either the conversion of the combine to the ionic form does not take place, or a recombination occurs so that, though the total calcium content is about normal, the ionic is found to be reduced. This indicates that the tissues fail to use the calcium absorbed from the alimentary canal in the absence of the parathyroid hormone. In other conditions which

may be confused with sprue—such as pancreatic affections, the so-called coeliac disease of children, post-dysenteric diarrhoeas, ankylostomiasis, filariasis, to name but a few—this peculiar behaviour of the calcium does not obtain. The test, therefore, known as Vines's test, after its deviser, is of inestimable value in diagnosis and, since the proportion of ionic to total calcium increases with progress under treatment, affords a reliable indication when carried out at intervals.

The chief points on which the calcium parathyroid-deficiency theory is based are (1) the fatty diarrhoea, loss of weight, cramps, oedema and tetany as symptomatic of faulty calcium metabolism, (2) the low proportion of ionic calcium in untreated sprue, (3) the increase of ionic calcium as the condition improves and its fall if a relapse occurs, (4) the improvement when calcium is administered alone, which is quicker and more stable when combined with parathyroid.

**Treatment.**—The treatment is rest in bed for a fortnight on a diet restricted to milk (increasing from 4 to 7½ pints daily) which itself contains much calcium and, to ensure an abundance of this element, calcium lactate may be given in cachets (gr. 15 thrice daily) and, to regulate its distribution and support the failing glands, extract of parathyroid (gr. 1/10th twice daily). The parathyroid *must* be free from all admixtures with thyroid (most preparations contain some of the latter) for these two appear to be antagonistic and if any of the latter be present, the symptoms become aggravated and palpitation and other indications of thyroid excess are superadded. With a pure preparation, however, the sprue symptoms improve within a fortnight, the ionic calcium increases to about 8 mgm. %, the stools are reduced to one a day and the soreness of the mouth disappears. Gradual additions to the diet can then be permitted and the patient allowed up for an increasing time each day. At the end of four weeks in favourable cases, the calcium lactate can be dropped and the parathyroid reduced to half doses. By this time or within another week or so, the blood serum will show a normal calcium content, but the parathyroid-extract should not be left off entirely for another three to four weeks in order to stabilise the condition before all support is removed. Should any symptoms of recurrence appear, a return for a few days to a simpler diet and to the parathyroid extract will restore health.

Many patients treated on these lines have returned to their duties abroad, many others, unable to come home, have been treated in the tropics and have recovered. A few years ago the appearance of sprue meant immediate return to a temperate climate, prohibition of future residence in the tropics and the ruin of a hopeful career abroad. (H. H. Sc.)

**SQUASH RACQUETS** (*see* 22,783) has developed remarkably since 1910. Formerly it was played chiefly at public and private schools, while courts were to be found at a few clubs and private houses. Shortly before the War the game began to increase in popularity and afterwards its spread has been rapid, both in Great Britain and America, while there are now a certain number of courts on the continent of Europe.

The standard dimensions for courts are different in the British Isles and the United States and there are also some variations in the rules of the game as practised in the two countries. This, however, has not prevented the players meeting in matches. In 1924 a British team visited Canada and the United States and an American team came to England in 1925. A number of individual and team competitions are now held annually, among them being an amateur championship and a ladies' amateur championship. One advantage of squash racquets is that courts lend themselves readily to artificial lighting and the conditions for play are as good at night as during the day time.

**SQUIRE, JOHN COLLINGS** (1884- ), British man of letters, was born at Plymouth April 2 1884 and educated at Blundell's School, Tiverton, and St. John's College, Cambridge. He then engaged in publishing and journalism, working for a time in the Press Gallery of the House of Commons. He became literary editor of *The New Statesman* in 1913, and was its acting editor in 1917-8. His early poems were issued as *Poems and Baudelaire Flowers* (1909), after which came some clever parodies, *Steps to*

*Parnassus* (1913) and *Tricks of the Trade* (1917). Further poems included *The Lily of Malud* (1917), *The Birds* (1919), *The Moon* (1920), and *American Poems* (1923). In 1919 Squire founded *The London Mercury*, a monthly journal of literature and the arts, soon a distinctive stronghold in contemporary English criticism. He was also responsible for several volumes of reprinted essays and reviews (some originally under the pseudonym of "Solomon Eagle"), a number of anthologies of verse, and a book of short stories, *The Grub Street Nights Entertainments* (1924). See ENGLISH LITERATURE.

**STAFF, MILITARY** (see 25.752).—One result of the unqualified success which Prussian arms achieved in the wars of 1866 and 1870–1 was that the general staff principle, which had so largely contributed to give victory to the hosts controlled by von Moltke in those contests, was adopted by almost every military power during the last quarter of the 19th century. Thus in the different staff organisations as they were constituted in peace-time, work in connection with devising plans for offensive operations and for ensuring territorial defence, duties dealing with the collection of military information, the superintendence of the education of officers, the conduct of manoeuvres and the training of troops, were kept as far as possible distinct from administration—*adjutantur*, as the Germans call it.

**General Staff System.**—Only two of the more important nations—the United Kingdom and the United States—adhered to previously existing systems, under which preparation for war was relegated to the background in staff duties. Then came the South African War of 1899–1902. The difficulties and disappointments encountered by British military forces in that protracted struggle, coupled with the unsatisfactory working of the staff in the field (especially in its higher grades) during the progress of the operations, made plain the need of reform, and in 1904, the Government set up a "War Office Reconstitution Committee" charged with the duty of reorganising the central administration of the army. By far the most important of its proposals was that a General Staff Department, which was to constitute the foremost branch of the professional side of the War Office, should be created. The recommendations of the committee were accepted by the Government, and so it came about that a British general staff was established 10 years before the outbreak of the World War.

During those ten years remarkable progress was made, and when the nation was confronted by the tremendous emergency of Aug. 1914 it had at its disposition a body of well-trained general staff officers, sufficient for the comparatively small army that was available to take the field at the opening of hostilities, although totally insufficient to meet the requirements of the vast forces which had to be improvised after war had broken out. The Government of the United States was still later than that of the United Kingdom in establishing a general staff of the kind that Scharnhorst had thought of a century before. This was only set on foot in 1911, six years before the entry of the Republic into the great conflict which was to upset so many preconceived ideas on the subject of conducting war, but which was to prove—even more conclusively than had the Franco-German War and the Japanese triumphs of 1904–5—how imperative it is under modern conditions for a state which embarks upon a serious struggle to have an efficient and suitably organised military staff at its command.

**Modern Functions of the Staff.**—The remarkable progress in modern science has tended to impose new duties and new branches upon military staffs, for instance, the utilisation and control of railway communications, of electric communications, of mechanical traction. The appearance of the tank on the battlefield increased staff work. Finally, the establishment of air power introduced a factor of incalculable importance as affecting the control of the belligerent armies.

One most important duty which devolves upon the general staff in a State compelled by its geographical position and by political and international problems to maintain fighting forces both by sea and by land is the establishment and maintenance of intimate relations with the naval authorities. Attention had

fortunately been paid to this question in the United Kingdom during the period that intervened between the creation of the British general staff and the outbreak of the World War, and to this is to be attributed the secrecy and the smoothness with which the British Expeditionary Force was transported across the Channel to France during the fortnight succeeding the declaration of war in 1914. General staffs on the Continent did not, on the other hand, prove to be equally well-informed as to maritime conditions; this was made apparent during discussions such as often took place between military authorities representing the different Allies, concerning the policy which ought to be pursued in the Near East and other problems in which sea-power was necessarily involved. When a country elects to make of its air service a department of State distinct from the army, as has happened in the United Kingdom, it necessarily falls to the lot of the military general staff to maintain those intimate relations with the air staff by which alone co-operation can be secured in time of war.

**Staff and Government.**—"War," said Clausewitz, "is only a continuation of State policy by other means," and elsewhere that "none of the principal plans which are required for a war can be made without an insight into the political relations." It was a recognition of this truth on the part of her Government that led to the triumphs of Prussia first over Austria in 1866 and then over France in 1870. The history of the short-lived German Empire indicates that in later years there was a tendency for the general staff to attempt to direct, and even partially to succeed in directing the policy of the Government. But the passages quoted above from the great Prussian military writer do not inculcate anything of that kind. What they do inculcate is that there should be at all times an intimate understanding between what has been called the "brain of the army" and the civilian executive at the head of the State.

It is on the central directing branch of the general staff, *i.e.*, on the General Staff Department at the War Office in the case of the United Kingdom, as it was on the "Great General Staff" of the days of von Moltke and the German Empire, that devolves the duty of maintaining relations with the Government and of advising it regarding the military aspect of problems created by the international situation. That central directing branch of the general staff is entitled to expect that the Government shall keep it fully *au courant* with the political conditions of the day. The merits of the doctrine preached by Clausewitz seem to be self-evident, but leaders of opinion in the United Kingdom were slow to realise its importance. There existed an almost unaccountable inability to perceive the dangers to which a State unprepared for emergencies is exposed. The bitter experiences of the South African War were required to awaken British statesmen to a realisation of their responsibilities.

**The Committee of Imperial Defence.**—The lessons of that contest were to some extent learnt, and there was set up the Committee of Imperial Defence, in which professional opinion was given a voice. But although the more prominent members of the Government were included in it, the committee itself was merely a consultative body, and no executive action involving expenditure could follow on one of its decisions without the obtaining of at least nominal Cabinet sanction. Moreover, it did not necessarily follow that the view of the general staff would be accepted by the committee even on academical questions. An interesting example of the working of the system is provided by the story of the Dardanelles.

When hostilities arise some instrument a good deal more effective than a consultative committee is needed to control conduct of the War, and, from Aug. 1914 to the date of the Armistice, the operations were, in the case of the United Kingdom, for the first two and a half years of the struggle under supreme charge of various forms of war council directly representative of the Cabinet and given a free hand by that body. They were later under supreme charge of the specially established War Cabinet. The general staff was practically always represented at the meetings of the war councils and of the War Cabinet, but purely in an advisory position without voting power. As a matter of fact its

opinion was occasionally ignored in questions of considerable importance. This was no doubt partly due to some want of confidence in its judgment felt in Government circles owing to the slow progress made towards victory, and partly due to the personality and the temperament of certain members of the Government itself.

It has been said that a general staff must "think politically." If this maxim is merely to be taken as a meaning that a general staff should appreciate political habits of thought, watch political tendencies and keep itself acquainted with the political aspects of every question influencing military action alike in peace and in war, its truth is indisputable. But one of the most important duties falling to the lot of a general staff, especially in times of emergency, will often be to strive to prevent mere policy from adversely influencing the conduct of operations of war. History provides some striking examples of political considerations gravely prejudicing the prospects of armies in the field. MacMahon's fatal march to Sedan was a case in point. The retention of Gen. Penn Symons' advanced force at Glencoe in the opening days of the Natal campaign of 1899 furnishes another instance.

*The Administrative Staff.*—Neither in the United Kingdom nor in any other military state does the staff of an army consist of a general staff alone. There must always be its "administrative" side. In peace-time, the administrative staff of an army is in a sense the more important of the two. The army has to be recruited and fed and clothed and equipped, and its discipline has to be maintained.

The British plan subordinates the administrative staff to the general staff less than is the common practice. This is perhaps due to the nature of British campaigns of the 1874-1902 era, campaigns fought in regions often destitute of communications and always poor in resources. Almost everything hinged on supply and transport in these contests. Losses in action were as a rule trifling as compared to losses from disease. For one thought that the commander or his chief advisers gave to the enemy, ten thoughts were given to communications. There was little difficulty in beating the enemy if only supplies could be got up to permit a fight. But, to whatever cause it may be attributable, the fact remains that the chief of the general staff of a British army nowadays is merely in the position of *primus inter pares* relatively to the adjutant-general and the quartermaster-general—and it is the same at the War Office. In almost all other armies, on the other hand, including that of the United States, the chief of the general staff is definitely chief of the staff.

*British and Other Systems Compared.*—If the existing British staff organisation comes to be compared with those where the chief of the general staff is also chief of the staff, it will be found that there is something to be said on both sides. That part of the British system under which a command or a district is in peace-time supplied with a superior officer in charge of administration, to whom wide responsibilities are allowed and who is generally in practice senior to the principal general staff officer, permits the general in command to devote nearly the whole of his attention to preparing his troops for war. But that arrangement would be unworkable in the field. There the progress of operations is so dependent on the work of the administrative staff that the commander cannot transfer his authority in connection with the latter to somebody else—as is recognised in the British staff organisation in time of war by the heads of the adjutant-general and the quartermaster-general staffs, as well as the inspector of communications, then dealing direct with the commander. Although peace represents the normal state of affairs, armies none the less exist for purposes of war, and in time of war the case for the British system is not so strong.

In face of the enemy, operations—planning them, deciding whether the plan is feasible, and taking the necessary steps for their execution—are of paramount importance, but cannot be said actually to govern administration, for unless the army's establishments are maintained and unless it has its food, its ammunition, etc., it cannot carry out the operations. It is for

the administrative staff to say whether the plan is feasible from the point of view of supply, transport, depôts, hospital service, and so forth. It is, however, for the general staff to weigh the administrative as against the strategical aspects of the case and then lay the whole subject before the commander for a final decision. The British *Field Service Regulations* clearly admit by implication that the chief of the general staff is the superior of the adjutant-general, the quartermaster-general and the chief of communications, without their being actually under him. That, under conditions such as develop on active service, is apt to prove a somewhat clumsy arrangement and to give rise to friction. It is neither one thing nor the other.

Granted that the "chief of the staff" system means centralisation, granted that it demands from the chief of the general staff a somewhat closer acquaintance with purely administrative questions than would be necessary if the heads of the chief branches of the administrative staff were virtually his equals, even granted that under it less of his time will be available for the consideration of the strategical and tactical situation than would otherwise be the case, the system does seem a more satisfactory arrangement for purposes of operations in the field than that which found favour in the British Army after the setting up of the Army Council. (C. E. C.)

**STAFF, NAVAL.**—Modern war involves the task of co-ordinating a multitude of subordinate commands, an array of specialised departments and a number of highly technical services towards a single end. The Command must not lose itself in the maze of detail. It must be free to survey any part of the whole, to formulate important decisions and supply a strong impetus of direction. The task of co-ordinating all these activities and of preparing a clear picture of the situation is performed through the instrumentality of a staff.

The principles of German staff organisation are well known. A clear line is drawn between "operations" and "maintenance," that is, between the task of using the instrument and the task of maintaining it in an efficient state. This is the first principle. The second is that the business of war must be performed by officers specially trained, drawn from the services they control, acquainted at first hand with their needs and seeing things through their eyes. This is the essence of Scharnhorst's and Moltke's system, one of the monumental achievements of the 19th century. It did not, however, commend itself to the navy. The naval officer had been brought up to delight in detail. The old type of flag officer felt quite competent to conduct with one or two assistants all the business of war and was jealous of the idea of training young officers to assist him. He could point, too, to an Intelligence Division in existence since 1885 and to a War College for senior officers, both of which had done a large array of good work.

It was only in 1912, after the Agadir crisis, that Mr. Winston Churchill was able to lay the foundations of a naval staff and to institute a course of staff training, but the navy had not suffered in the South African War and there was no weight of strong service opinion behind him, such as assisted Lord Haldane at the War Office. Under a First Lord's memorandum of Jan. 1912 a chief of the war staff was appointed with three divisions of the war staff (operations, intelligence and mobilisation), and a staff college was started for the training of staff officers. The memorandum was a brilliant one, but the Admiralty system was too strong for it. The chief of the war staff had no seat on the Admiralty Board, his function was purely advisory and he could not speak with any degree of authority. The space of two years was all too short to supply a sufficiency of trained staff officers, and the outbreak of war found the navy 10 years behind the army in this respect.

When war broke out the machinery of the staff more or less collapsed, and its work was performed by a small group of flag officers known as the "war staff group," working more or less independently of each other, a system which made it difficult for the divisions of the staff to get information. No one was quite certain what the flag officers did or even where they did it. The conduct of the Dardanelles campaign revealed the

deficiencies of this system and made it clear that there was no real machinery for the investigation of big strategical questions. Two years passed, and the menace of the submarine led to the inauguration of a better system on the army model.

In May 1917 the office of Chief of the Naval Staff<sup>1</sup> was attached to that of First Sea Lord; and by the appointment of a deputy chief and assistant chief of the staff to the board, the staff was given direct representation on the board and any course of action could quickly be given Board authority. New divisions manned by officers drawn from the fleet and in close touch with its work were added to the staff. An anti-submarine division was organised to control the campaign against the submarine. A plans division drew up plans for the mining of the Bight, Dover barrage and (in conjunction with Adml. Sims and his staff) the great northern barrage. A maritime movements division took the whole regulation of convoys into its hands, and the section dealing with wireless directionals and wireless intelligence was at last placed under the Director of Naval Intelligence and opened to the staff.

The Naval Staff grafted on to the Admiralty in war time in order to meet an urgent need, differs in some respects from the Imperial General Staff which grew up in peace-time at the War Office under Lord Haldane as an integral part of army administration. Thus in the General Staff, the Chief of the General Staff and the Director of Staff Duties exercise a much larger measure of control over the whole field of training than is to be found at the Admiralty, where questions of education seem to get lost in an array of departments, for the division of training which Mr. Churchill contemplated in 1914 never fully materialised. The question of the relationship of the Chief of the Naval Staff to "Chiefs of Supply" (the Third and Fourth Sea Lords), corresponding to the Chief of the Imperial General Staff and the Quartermaster-General, is less acute, for the First Sea Lord has always exercised a high traditional authority in these spheres.

Difficulties between the Chief of the Naval Staff and the Second Sea Lord as Chief of Personnel (corresponding to the Chief of the Imperial General Staff and the Adjutant-General) on questions of training could be largely avoided if the Second Sea Lord's office was reorganised on modern lines. Outside the Admiralty, the Chief of the Naval Staff has relations to maintain with the political executive and the other Government departments, more particularly with the army and air service. The first is best maintained through the Committee of Imperial Defence and the Cabinet secretariat, the latter through liaison and regular staff conferences. War on sea is one thing and war on land is another, and fusion of naval and military staffs would merely mean confusion. Their orbits cross in landing operations and bombardments, and here both services can work together on uniform and well recognised lines. Finally, no system can rise higher than the men who operate it. It is the men in it who bring success to a staff system and mould it as circumstances require. (See WORLD WAR: BIBLIOGRAPHY.) (A. C. D.)

*United States.*—The task involved in co-ordinating a multitude of subordinate commands and specialised technical departments is well illustrated in the organisation of the Dept. of the Navy of the United States. The department is presided over by the Secretary of the Navy, who is a member of the President's Cabinet. Under the Secretary of the Navy there is an Assistant Secretary of the Navy who performs such duties as may be prescribed by the Secretary, his chief duty being departmental administration of navy yards. In 1926 an additional Assistant Secretary of the Navy was provided for by law, to aid the Secretary of the Navy in fostering naval aeronautics. Under the Secretary of the Navy the two broad functions of operations and maintenance are handled by naval officers of the active list.

The chief of naval operations is appointed by the President and confirmed by the Senate for four years, with the rank and title of admiral. Under the Secretary he is charged with the operations of the fleet and with the preparation and readiness of plans for its use in war. To carry on the specialised work which may broadly be termed maintenance, there are under the Secre-

tary of the Navy eight bureaux, each headed by an officer with the rank of rear admiral. The names of the bureaux are indicative of their functions. They are: The Bureau of Navigation, in charge of all naval personnel, the Hydrographic Office and the Naval Observatory; the Bureau of Ordnance; the Bureau of Construction and Repair; the Bureau of Engineering; the Bureau of Yards and Docks; the Bureau of Supplies and Accounts; the Bureau of Medicine and Surgery; and the Bureau of Aeronautics. In addition to the office of the chief of naval operations and the various bureaux, there are three other important offices under the Secretary of the Navy. These are the General Board, the office of the major general commandant of the marine corps and the office of the judge advocate general of the navy. Every chief of bureau or head of an office furnishes such information and data as may be called for by the chief of naval operations.

The chief of naval operations, to carry out so large a task as the operation of the fleet and its preparation and readiness for war, has under him a considerable organisation. Each of the divisions of his office is headed by a rear admiral or a captain. The divisions are organized to carry out the functions of war plans, fleet training, intelligence, inspection of ships, ship movements, communication, the military administration of naval districts and the co-ordination of personnel and material readiness. With this organisation the chief of naval operations is able to prepare and maintain readiness plans for the use of the fleet in war, issue regulations for the training of the fleet in peace and co-ordinate the work of the bureaux in such a way as to meet the material and personnel requirements of the fleet and place it in readiness for war. To advise the Secretary of War and the Secretary of the Navy in matters wherein co-ordination and co-operation are required between the army and navy regarding national defence, there is a Joint Army and Navy Board, whose personnel is drawn from the general staff of the army and from the office of the chief of naval operations. The word "staff" itself is not used in the United States Navy. (E. W. E.)

**STAGE AND STAGE PRODUCTION** (see 26.732).—During the period 1910–26, many plays on the European and American stages were produced according to the principles and theories of the naturalistic theatre, the formal theatre, synthesisism, expressionism and constructionism, these movements in theatrical art being the most recent developments of stage theories.

But the majority of modern theatres remain untouched by these movements, and, in these, plays cannot in any way be said to be "produced." The actors play their parts, each for himself, and in the manner he finds most effective for himself, without consideration for, or even understanding of either the total form of the play or the dramatic ensemble. The real producer, the "régisseur" or "metteur en scène" in such theatres is unknown. His place is taken by the leading actor or by someone whose business it is so to arrange matters on the stage that the leading actors may be continually in the limelight. As means of interpreting and expressing the play, the scenic surroundings in these theatres are entirely meaningless. Nearly all the operatic, and a large proportion of dramatic theatres (for example, the Comédie Française in Paris) must be included in this category. The waves of the stormy theatrical ocean beat upon them, but are not strong enough to move them from the spot where they have quietly rested for more than 70 years.

#### THE NATURALISTIC THEATRE

In Germany, interesting naturalistic productions—especially of Hauptmann's plays—were given by Otto Brahm, mostly at the Lessing Theatre in Berlin, from 1904 to 1912. The influence of Brahm is very noticeable in the work of one of the best-known producers of our time, Max Reinhardt. In America, examples of this type are to be found among the productions of David Belasco. In France the naturalistic theatre founded by André Antoine has had no followers worthy of mention, and, practically speaking, has ceased to exist. In Russia, on the other hand, stage naturalism reached its greatest perfection through the work of the Moscow Art Theatre (now known in Soviet Russia as the Moscow Academical Art Theatre) founded by C. S.

<sup>1</sup> The old name War Staff was changed to Naval Staff.

SCENE FOR THE BALLET, "THE FIRE-BIRD"

Decoration by A. Golovin, from the aquarelle by René Lelong

Stanislavsky and V. T. Nemirovich-Danchenko. The Moscow Art Theatre began by following the principles of the productions at the Meininger Theatre established in 1874 by Duke George II. of Meiningen, and carried on until 1890. As at the Meininger, the Moscow artists fought against routine and stale tradition. They took from the Meininger the sets invented by the Duke George to give the full illusion of real living rooms, with ceilings, constructed three-dimensional details, natural lighting and perspective of other rooms. They used also the so-called "horizon" (panorama), introduced for the first time on the stage by the Meininger, the three-dimensional trees placed in the middle of the stage, the natural effects of singing birds, thunder, rain, crickets behind the stove, wind blowing the curtains, and so forth. The production of crowd scenes, neglected before the Meininger, also became a very important feature of the Moscow Art Theatre.

Some of the producers of the Stanislavsky Theatre trained their actors in the same way as did Kroneg, prescribing the exact intonations and emphases, gestures, movements and facial expressions. For the *mise en scène* they adopted Kroneg's method of dividing the stage into numbered squares like a chess-board, and moving the actors from one square to another. Later, while working upon the production of Chekhov's *Seagull*, Stanislavsky discovered that it is not enough for an actor to simulate nature by putting on a naturalistic make-up and using characteristic intonations, gestures, tricks and changes of voice. An actor has to "live" his part, i.e., to "feel" it really. To do this, he has to discover beneath the lines and stage directions the feelings that prompt those lines and directions—and because, according to Stanislavsky, an actor, or human being, "cannot naturally feel and express things he had not experienced in his own life," he has to remember and repeat on the stage the emotions experienced in his own life.

*The Stanislavsky System.*—On that principle is based the Stanislavsky "system of acting," at one time famous in Russia. The system led his theatre from the outward naturalism, toward a kind of inward naturalism, which led not merely to a complete neglect of the form of the play, but even to its destruction. For acting is not a repetition of the feelings experienced by an actor in his personal life, but the creation and expression of complicated feelings and thoughts prompted by the style and form of the play.

Stanislavsky's method was important for the general development of theatrical art, because it forced the producers and actors to forsake the outward naturalism and its tricks, and to give more value to the inner content of the plays and parts. But it brought the Moscow Art Theatre and its followers back to the 18th century, at which period theatrical scholars were of opinion that an actor on the stage "can only repeat emotions he has experienced in his own life," and that "the love-scenes are much better played by such actors as are really in love." The Moscow Art Theatre, when dealing with naturalistic plays, gave, from every point of view, accomplished and beautiful productions. Among these were some of the Chekhov plays, Gorky's *Night Lodgings* and Alexis Tolstoy's *Tsar Fedor*.

But when the producers attempted poetic or symbolic drama—Shakespeare or Pushkin, Byron or Gogol—they inevitably failed. Plays by these authors were dragged down from their heights, and drowned in naturalistic details or psychological experiments. The language was ruined, its power and beauty being sacrificed to naturalistic principles. A play written in verse was delivered as prose, because "verse is unnatural." In 1923 and 1924 the Moscow Art Theatre went to America with some of its earlier productions of Chekhov, Gorky, Tolstoy and Dostoevsky, and in 1925-6 were seen the new experiments of that theatre, with Aristophanes' *Lysistrata*, and two musical plays, Offenbach's *Pericolla* and *Carmencita* and the *Soldier*, an adaptation of Bizet's *Carmen*. All these plays were produced by W. Nemirovich-Danchenko on the lines of the formal method of production mixed with the constructive method. Neither method, however, is in any way typical of the work of the Moscow Art Theatre.

#### THE FORMAL THEATRE

The so-called "Formal Theatre" came into being as a protest against naturalism on the stage, at the very end of the 19th century. The "Formalists" held that the naturalistic theatre was not art, but a soulless attempt to photograph life, and that its actors were monkeys, endeavouring to imitate on the stage, characters, with their little habits and tricks, which they had observed in real life. The "formalists" sought first of all to simplify the stage settings. For example, instead of reproducing life-like rooms, giving exact copies of nature, or restoring historical surroundings with fidelity to details of time and place, they recommended "formal" scenery providing for the actor only suitable backgrounds or necessary surroundings for his acting.

*The Leading Formalists.*—Some of the formalists, notably a few of the new Russian producers, being inspired by the paintings of the later impressionists and primitivists, and by the work of the modern Russian and French painters, advocated the use of painted backgrounds, "panneaux décoratifs," only. Others, such as Adolphe Appia in Switzerland, Gordon Craig in England and Georg Fuchs in Germany, were against the use of flat painted settings, and recommended three-dimensional scenery. Appia and Craig went as far as to declare the painter-artist not only unnecessary, but a positive hindrance inasmuch as he was concerned only to make a picture and cared nothing for the placing of the actor. They thought that the building of the scenery ought to be in the hands of the producer himself. Georg Fuchs advocated the use of "stylised" settings and costumes, instead of the faithfully reproduced historical settings, costumes and life-like appearances. By "stylised" he meant that the settings and costumes should show not local details, or details of any particular historical epoch, but should be designed to provide a general idea of the play. Gordon Craig advocated abstract costumes and scenic surroundings, high screens resembling the towers of Ravenna, steps, platforms and other devices.

The Russian producers of the new school, such as Evreinov and Meyerhold, and before them, S. Marmontov, director of the Moscow Private Opera House, discarded the old-fashioned scene-painter and had their scenery designed by regular artists. With them begins the "picturesque" formal theatrical movement, which brought into fame the names of theatrical decorators such as Vroubel, Konstantin Korovin, Leo Bakst, Nicolas Sapounov, Alexandr Benois and Golovin. The director of the famous Russian Ballet, Serge Diaghilev, has always been one of the promoters of this movement, and thanks to him, such eminent French painters as Derain, Picasso, Matisse, Georges Bracque, Marie Laurencin, have come into fame as theatrical decorators. The Swedish Ballet of Rolf de Mari, following rather unsuccessfully the road indicated by Diaghilev, has shown us scenery by Picabia, Fujita and other modern painters.

In their notions of *mise en scène* and acting, too, nearly all the producers of the formalist school were influenced by Appia, Craig and Fuchs. From the formal stage, the "natural" speaking of lines, the "natural" movements and groupings, were banished, the symbolic and abstract costume plays being preferred. The Russian producer, Meyerhold, went as far as to advocate for the plays of Maeterlinck a kind of monotone voice without inflection, sounding "like drops falling into a deep well." As a reaction against the life-like movement which was the ideal of the naturalistic producers (the "crowd-work" of the Meininger and their followers), the formalists, under the influence of Maeterlinck, were enthusiastically in favour of "static" acting. Those who adopted the "picturesque," two-dimensional scenery dressed, grouped and posed the actors so that they should be in perfect keeping with the painted backgrounds, and even in some cases give the illusion of having been painted on the scenery. The actor being reduced to the position of a mere accessory, his art was eliminated. Some of the theorists had already come to the conclusion that the living three-dimensional actor, in front of the two-dimensional painted backcloth, was an anomaly in the picture, and should be replaced by a two-dimensional marionette.

The inventors of the three-dimensional "formal" scenery gave much more scope to the actor. They invented that kind of scenery in order to free the actor from the limitations of naturalistic settings, and give him a prominent position on the stage. Appia recommended constructions composed of straight lines, as being more in harmony with the three-dimensional actor, and as giving the necessary value to the curved character of the human body. Gordon Craig followed that idea, but Appia, in his scenic designs, although they were formal and stylised, still remained a naturalist. His formal, castle-shaped edifices were built of stone, and his forests, although formally related to the later futuristic scenery, remained real forests. Craig simplified his buildings to abstract three-dimensional screens of one colour, and in his settings will be found rows of steps, and square platforms indoors and outdoors by which means everything is symbolised. Elements of nature are absent, excepting perhaps in the suggestion of the sky.

*Ideas of Fuchs.*—At Munich in 1908 Georg Fuchs in a theatre (Münchener Künstlertheater) built in accordance with his new ideas, used scenery designed by Erlar and other well-known German painters. It was simplified, constructed three-dimensional scenery, but it was not abstract. It was painted, and gave the impression of reality. For instance, the cathedral scene in *Faust* was represented by a massive and lofty church column; the whole stage around the column faded into darkness, and in the background the altar was suggested simply by lights. In a pastorelle, he had a real "bosquet" made of real leaves, with arches, against a pale blue background.

Fuchs, like all the formalists, attached great importance to lighting, and in his Munich theatre he arranged a quite new system. There one had for the first time a stage without footlights and battens, but with special arrangements of diffused light resembling the light of nature. His "formal" stage was according to the old idea of Goethe—very shallow and divided into three parts, each one complete step higher than the other. The lowest of these was a narrow permanent proscenium enclosed between two movable flats with doors (called "towers") and covered by a ceiling that could be raised or lowered. This arrangement was afterwards imitated by Max Reinhardt in his *Faust* and other productions in Berlin. The acting ideas of Fuchs were on broad "stylised" lines. The groupings were sculptural and picturesque, and instead of "crowd" scenes ingenious suggestions of masses of people were employed.

*Reinhardt and Granville Barker.*—These features of the Fuchs stage are to be found in the productions of the latest schools such as the "expressionists" and the "constructionists," and in some of the productions of Reinhardt. In dealing with this famous German producer, it must be said that his fame rests more upon his versatility and his big sense of theatrical business than upon his originality. He started his career as an actor at the Municipal Theatre of Salzburg, and then came to Berlin, where he was with Brahm. When he opened his own theatres in Berlin, he produced plays in a variety of manners, always attaching great importance to good acting. His work was obviously influenced by Brahm, the Moscow Art Theatre, Gordon Craig, Fuchs and others of the later period.

In 1910 he opened his Grosse Schauspielhaus in Berlin, a theatre of "masses." Before beginning the performances there, he staged a Greek play (*Oedipus Tyrannus*) in the circus, bringing the action into the midst of the audience, and in a sense making the audience take part in the performance. It is clear that he found that idea in the writings of some theatrical theorists of the beginning of the 20th century. Among those, one of the most important was the Russian philosopher Viacheslav Ivanof, an authority on Greek literature and the Greek theatre, who advocated the theatre of masses, and the participation of the spectators in the theatrical show, which, according to him, ought to be given in the arena. Later, Fermin Gémier, in Paris, followed Reinhardt's example by producing plays in a circus.

In England, Granville Barker worked on nearly the same lines as Reinhardt; but whereas Reinhardt only changed the style of his productions for the sake of variety, Granville Barker

varied the style to accord with the inner meaning of the particular play. Moreover, although he had not such power as Reinhardt in dealing with actors and extracting from them their finest possibilities, he showed much greater artistic taste in selecting his material, and did not work for "stunts" as Reinhardt did in many cases.

#### THE SYNTHETIC THEATRE

It is in Russia that the genesis of the theatrical theory of "synthesis" is to be found, from which developed later "expressionism" and "constructionism." That theory originated partly as a result of some stage productions carried out by Komisarjevsky in a new way, in opposition to the methods of the "formal" theatre and partly as an experiment for the purpose of finding a more perfect form of theatrical show. It was intended that this show should, by uniting all the stage arts, produce the most powerful and complete impression on the audience. The "formalists" as the "naturalists," using the same methods of production for all plays, placed the actors and the plays in a condition of dependence upon the laws of nature in the one case, or upon their theories of uniformity in the other. Komisarjevsky, on the contrary, holds that the plays of each author should be produced and acted in a different form, each form to be expressive of the inner contents, rhythm and style of the play produced. Production is an expression of the understanding of the play by the producer, and the ensemble of the actors. The form chosen for that expression need be neither life-like nor formally unlife-like, but it must be synthetically expressive; that is to say, the elements of the scenic surroundings must be selected and put forward in such a way as to create the atmosphere desired by the producer and without distracting the spectator's mind with unnecessary factors, whether life-like, stylised or cubistic. On the other hand all the theatrical arts should be included in a synthesis, just as in an orchestra the different instruments are united for expression of the whole.

From these considerations there was evolved the conception of the synthetic play for a synthetic theatre, in which the movements, words, music and the colours and lines of the scenic surroundings would be united. The general idea, of course, is the same as that which was expressed long ago by Richard Wagner. Wagner, however, subordinated everything to his musical score, to the polyphony of his instrumental and vocal ensemble, and drowned the play and the actors in the orchestra. In acting, scenery, lighting, etc., and even in his treatment of his fantastic stories and characters, Wagner was a pure naturalist, and moreover a stagey naturalist. A school of acting on synthesisist lines was opened in Moscow by Th. Komisarjevsky, who adapted and produced operas by Mozart, Rossini, Offenbach and Wagner, and plays by Shakespeare, Beaumarchais, Molière and other leading dramatists.

In 1922 Komisarjevsky produced on the same lines Claudel's *The Tidings brought to Mary* for the Theatre Guild of New York, the only "art theatre" at the present time in the English-speaking world. The Provincetown Playhouse in the same city follows, under the leadership of Robert E. Jones (painter and producer) and K. Macgowan, the path opened in America by the Theatre Guild. The Guild, which started in a small place in Washington square, now has its own playhouse in the West End of New York, equipped with the newest European and American technical improvements. Without being extreme or daring, this theatre showed to New York examples of nearly all the European schools of production. In dealing with the forward movement of the productions in the United States, one cannot omit mention of amateur societies in the provinces, which are much more advanced than the Broadway commercial enterprises. In France, the methods of "formal" production were used by Jacques Coppeau, who even built in his own playhouse (Vieux Colombar) a permanent architectural stage; by Dulain, Louis Jouvet and George Pitoëf. The latter in some of his productions followed the ideas of the expressionists and constructionists. In Belgium Delacre, and in Italy Pirandello follow the paths opened by the producers of the new schools.

## THE EXPRESSIONIST THEATRE

In Germany the "expressionist" school came into existence. They destroyed reality, decomposing it to create out of its elements new forms which were intended to be symbolically expressive of their understanding of life. Some of the expressionists might be called "cubists," as they treat their productions in the same way as cubist painters treat their painting; others are developing the ideas of the "formalists" and "synthesists." The most important expressionist is Jessner, who, in 1919, when he was appointed director of the Berlin State Theatres, began his expressionistic productions. Of these, *Wilhelm Tell*, *Richard the Third*, *Don Carlos* and *Marquis von Keith* (by Wedekind) were extremely interesting. In the matter of acting, although Jessner is the director of the Schauspielschule, the expressionists have brought nothing new to the stage; they have followed the traditions of Brahm and Reinhardt.

## THE CONSTRUCTIONIST THEATRE

The "constructionists" came into being in Russia in the last years of the Revolution. Like the expressionists they have made no new departure in acting, except to bring circus clowning upon the theatrical stage. They have exaggerated the movements of the actors to such an extent that, in their productions, the play itself (which as a rule is always adapted to suit the scenic constructions and the elaborate movements of actors) disappears in a kind of "perpetuum mobile" of the actors. Instead of the painted or constructed scene, the constructionists used naked platforms, steps, ladders, etc., building the action up, instead of having it on the floor level. The most important constructionists are Tairov and Meyerhold. The former at times uses painted, constructive scenery, and advocates "clowning" and perpetual movement of actors on the stage. The latter, in his last productions, left out the "clowning" and exaggerated movement; he leaves the stage quite bare, using only necessary and undisguised rostrums, tracks and steps, sometimes adding insignificant pieces of scenery, or posters dealing with political propaganda, parts of machines, etc., underlining with all these accessories the idea that the production is done in a republic of workmen and peasants. The first constructionist productions were seen in Moscow in 1921. The most important of them are: Crommelynck's *Le Cocu Magnifique* (producer—Meyerhold in 1921), Chesterton's *The Man Who Was Thursday* (Tairov in 1923), *The Storm* by Ostrovsky (Tairov in 1924), *Forest* by Ostrovsky and *The Lake of Ljull* (both produced by Meyerhold).

Constructionism during the last years was accepted in Russia as a kind of national style, and the other producers, even in the very old-fashioned state theatres, have produced some plays and operas in that way. Meyerhold, being a very experienced and imaginative producer, sometimes obtains very powerful effects, but all his work is nowadays carried on in the very narrow channel of political propaganda. The theatre in Russia of the last few years represents the latest phase in the development of stage-craft. It must be confessed that it is a very poor one, and only leads us back to where we started. The old followers of naturalism copied life as it is, down to all the smallest and artistically unnecessary details, but they did not lack romance and a certain poetry in their work. The constructionists substitute scaffolds for natural life surroundings, and showed on these scaffolds actors in new naturalistic plays produced in accordance with the old naturalistic methods, or no methods at all.

Gernier, *Le Théâtre* (1923.) (T. K.\*)

**STÅHLBERG, KAARLO JUHO** (1865– ), Finnish politician, was born on Jan. 28 1865. At the beginning of his public career, he held alternately university and administrative posts until he became a member of the diet in 1904 and of the Finnish Govt.

in 1905. He resigned in 1907 and in the following year was appointed a professor of administrative law. At the outbreak of the World War, the Government was Finnish in name only, being composed entirely of Russian officials. Ståhlberg was then president of the Diet and he had to act as the chief public representative of Finnish opinion. He withstood the increasingly oppressive tendencies of the Imperial Russian Govt. with unwavering firmness. After the Russian revolution of 1917 Finland became an independent Republic, and in the summer of 1919 Ståhlberg was elected to the presidency as the candidate of the Progressive and Socialist parties. The country was still split up by sharp internal dissensions, and the new President had from the very beginning to fight the unconcealed hostility and distrust of the conservative parties. He pursued, nevertheless, a conciliatory and mitigating policy with the object of extinguishing the class hatred and casting oblivion over the past. The many beneficial effects of this policy became gradually obvious, and when the time of the next presidential election approached, Ståhlberg could register the personal triumph that the country almost unanimously desired him to accept re-election. He refused, however, and retired on the expiration of his presidency.

**STALIN, JOSEPH** (1879– ), Russian politician, whose real name is Dzhugashvili, was the son of a Georgian peasant, and was born in the Tiflis district and educated in a seminary from which he was expelled in 1898 for revolutionary opinions. From 1898 till 1917 he was engaged in revolutionary propaganda, interrupted by frequent arrests, imprisonments and banishments. He escaped five times from exile. In 1917 he edited the Bolshevik newspaper *Pravda*. Always a close supporter of Lenin, and for a very long time a member of the central committee, he became after Lenin's death the most influential member of the Communist party and general secretary of the central committee of the Communist party. In the civil war he took an active part in the defence of Tsaritsin, which town was subsequently, in his honour, renamed Stalinsk.

**STAMBOLISKY, ALEXANDER** (1879–1923), Bulgarian statesman, was born at Slavovitsa, in Southern Bulgaria, Sept. 1 1879, the son of a peasant landowner. After studying at the village school and later in the neighbouring town, he attended the agricultural college of Halle in Germany. On returning to Bulgaria, aged 18, he took up journalism, and in 1902 became editor of the organ of the newly-formed Agrarian League. His articles brought him fame and six years later he was elected to the Sobranie, where he made steady progress, soon becoming leader of the Agrarian party.

He now began to organise the peasant masses, who form 80% of the total population of Bulgaria, into agricultural associations. In 1911, when the Grand Sobranie met at Tynovo to amend the Constitution, his first conflict with King Ferdinand occurred. After the treaty of Bucharest (1913) Stambolisky and the Agrarians were unmerciful in their criticisms of Ferdinand's policy, though deterred from extreme measures by the fear of external complications. Stambolisky's opposition to Ferdinand came to a head in 1915 during the negotiations that preceded Bulgaria's entry into the World War. The story of the alienation of official Bulgaria by the blunders of Russian and Western diplomacy remains to be written; but the Bulgarian peasants were "pro-Russian by race and pro-British in sympathy." Stambolisky, their representative, backed the Entente in spite of the King's anger, pressure from the Government and the growing influence of the Central Powers. Summoned before the King, Stambolisky threatened him with personal violence if he should fight against the Allies, reminding him that he had a crown to lose. Ferdinand warned Stambolisky to take care of his own head, and ordered his immediate arrest. After being tried by court-martial he was condemned to penal servitude for life.

In Sept. 1918, when the resistance of the Bulgarian troops began to slacken, Ferdinand released Stambolisky, who left for the Macedonian front. He returned at the head of the insurrectionary troops and their arrival at Sofia resulted in Ferdinand's abdication and flight. A partisan of the new ruler, King

Boris, Stambolisky became a member of the Cabinet in Jan. 1919 and Prime Minister in Oct.; as head of the Government he went to Paris and signed the Treaty of Neuilly in the same year. On his return in Dec. he was faced by a railway strike which he settled successfully. In Feb. 1920 he dissolved the Sobranie, and the following month was returned to power at the head of a homogeneous Agrarian majority. From 1920 to 1923, the Agrarians under Stambolisky ruled Bulgaria with a rod of iron. They were not only intolerant of all opposition, but even unjust in their treatment of political opponents. Surrounded by ill-advised colleagues, Stambolisky had neither the strength nor the time to exercise control over the firebrands. But though a dictator at home, he was a peace-maker abroad, and through his influence post-War Bulgaria won the esteem of the Allies. He inspired great confidence, not only at the Peace Conference, but at Genoa, Geneva and Lausanne. He made persistent efforts to improve relations between Bulgaria and Yugoslavia, and showed real statesmanship in concluding the Nish agreement (1922) with that country. He carried out the terms of the peace treaty loyally, and gave full satisfaction to the Allied Military Commissioners in regard to disarmament. With the help of Dimitri Stancioff, the Bulgarian Minister in London, he secured a reduction of Bulgarian reparations from £90,000,000 to £22,500,000.

The overthrow of the Government by a military faction on June 9 1923 was caused by Stambolisky's misguided policy at home. The change of régime took place in one night, the Agrarian Ministers being arrested in their own homes. Stambolisky, pursued by an armed detachment to his native village of Slavovitsa, escaped and fled across the mountains, hoping to reach the frontier. After being followed by soldiers for three days, he was eventually surrounded and shot on June 12. A formidable personality, attractive in many ways, and made of finer clay than the average Balkan statesman, Stambolisky has been called a modern Rienz. Tall and broad, his demeanour was fierce and his movements ungainly; his rough-hewn face was crowned by a mass of black hair; he impressed everyone with his strength and sincerity. A true patriot but a man of great simplicity, he had only the use of primitive tools. Stambolisky published several books, including *Authority, Anarchy and Democracy*; and *What a Politician ought to be*. (N. M.)\*

**STAMP, SIR JOSIAH CHARLES** (1880– ), British economist, was born in London June 21 1880. He was educated at the University of London, where he took the degree of B.Sc., with first class honours, in 1911, becoming Cobden Prizeman in 1912, D.Sc. in 1916, and Hutchinson research medallist in 1916. He entered the civil service (inland revenue department) in 1896, and became assistant secretary to the board in 1916. In 1919 he resigned from the service to join Nobel Industries Ltd., of which he was a director and secretary until he accepted the new post of president of the executive of the London, Midland and Scottish Railway in 1925. He was Newmarch lecturer on statistics, University of London, 1919–20, and served the Royal Statistical Society as honorary secretary and editor. Sir Josiah Stamp was knighted in 1920 for "valuable service to the Government in financial matters." As one of the most distinguished economists of his time, he was appointed a member of the committees of experts of the Reparation Commission in Paris and Berlin. He played an important part in the London Conference of 1924. He was also a member of the Northern Ireland finance arbitration committee in 1923–4 and a member of the Committee on taxation and national debt in 1924, in which year he was created G.B.E. (See CAPITAL LEVY; REPARATIONS.)

Sir Josiah's chief publications are *British Incomes and Property; The Application of Official Statistics to Economic Problems* (1916, 3rd ed. 1922); *Wealth and Income of the Chief Powers* (1919); *The Fundamental Principles of Taxation in the Light of Modern Developments* (1921, 2nd ed. 1923); *Wealth and Taxable Capacity* (1922, 2nd ed. 1923); *Joint Report on Double Taxation*, League of Nations (1923); *Studies in Current Problems in Government and Finance* (1924); *Business Statistics and Financial Statements* (1924), jointly with C. Hewetson Nelson; and the British edition of Rignano's *Social Significance of Death Duties* (1925).

**STAMP COLLECTING** (see PHILATELY, 21,374).—New postage stamps have been issued in great variety in modern times, and the number of standard varieties listed in a simple catalogue has more than doubled since 1906, being 44,000 as against 20,000. The annual output tends to grow rather than diminish, though the abnormal figure of 15,000 new stamps between 1916 and 1923 was in part due to war upheavals and post-War reconstruction. The effect on the more detailed catalogues used by philatelists is still more marked, and it is estimated that upwards of 160,000 varieties are listed in the leading British (Gibbons) and American (Scott) catalogues, while in Germany a start was made in 1923 with an encyclopaedic catalogue (*Kohl-Briefmarken-Handbuch*, ed. Herbert Munk) in which the first 1,056 pages reach only to "De."

This vast increase has embarrassed publishers of printed albums of the comprehensive kind formerly popular, and it has obliged collectors to set broad or narrow limits on the scope of their collections. General collecting is still extensively pursued but few attempt to collect the stamps of the whole world, selecting instead a geographical or political group, e.g., Great Britain and her Dominions, the United States and her possessions, etc. Still more collectors have carried their limitations further, and specialise in the stamps of individual countries. Intensive special study has reached a stage where at the London International Stamp Exhibition (1923) many exhibits dealt with single issues, and even single stamps.

Except the Tapling Collection in the British Museum, the great general collections of the past, including those of Ferrari, Philbrick, Worthington, Breitfuss, have all been dispersed; the philatelic magnates of to-day possess series of specialised collections, often covering a wide range of countries, but not compiled on the comprehensive lines of the great pioneers; some set a period to their collections, thus eliminating the prolific issues of recent times; 1890 may be taken as the close of the most interesting epoch of stamp issues for the connoisseur, but the close of the 19th century, coinciding with the end of the reign of Queen Victoria, is a convenient period (1840–1901) chosen by many collectors. There is also a modern school collecting stamps of the 20th century.

*Specialised Collecting.*—The Royal Philatelic Society (London), under the guidance of the 26th Earl of Crawford until his death in Jan. 1913, led the modern trend to historical and technical study of stamps in specialised fields. The philatelist of to-day traces the economic origins of the issue of stamps, the artistic sources of their designs, and the most exact and minute details of their manufacture. The articles "Postage Stamps in the Making" in Gibbons' *Stamp Weekly* and Gibbons' *Monthly Journal* (1910–4), revised in book form in 1916, provided a basis for technical research into the formation and use of dies, plates, stones, etc., the details of paper, watermark and devices to ensure security from forgery or the illicit re-use of stamps.

The effect of this specialism on the market has been remarkable. While rare stamps remain rare, their values have increased largely owing to the number of wealthy patrons who regard rare stamps as a good and protected investment. Comparatively common stamps, especially of the early issues prior to the introduction of perforation, have risen in value owing to the quantities which the specialist requires in order to pursue his technical studies. The original rd. black (Great Britain) stamp of 1840 is not rare; twopence would buy a good copy at the beginning of this century, and they were abundant on the market for some years later. Intensive study of this one stamp has led to the identification of 240 units from each of the 11 plates, some in two distinct states, used for printing the stamps; the collector, seeking to reconstruct the plates of the penny black, needs not fewer than 2,880 different specimens, to find which he would search through many times that number. There are other features of the study of this stamp, with its curious and interesting postmarks, which cause the specialist to drain the market of it and similar classes. Although common, an ordinary used copy of the rd. black is worth 5s. (1926), but a copy identified as coming from plate 11 is worth about £5. Similar conditions have elevated the prices of nearly all "first issues" and early imperfo-

rate stamps, notably the beautiful early stamps of the United States.

*The Ferrari Sale.*—The last great general collection to be dispersed, that of Philippe la Rénôtière von Ferrari, who died at Lausanne in 1917, was sequestered by the French Govt. and sold by auction 1922-5. Its owner had bequeathed it to the Berlin Postal Museum, which already houses a collection of great historical interest and value. In 14 sales, covering 39 days, the portions sold at the Hôtel Drouot, Paris, realised 26,482,964 francs, or £402,965, calculated at the rate of exchange prevailing at the different periods of the sales. This did not represent the entire store of Ferrari's stamp treasures.

Among the notable prices recorded at these sales were: the unique 1 cent British Guiana, 1856, £7,343; pair of 2 cent British Guiana, 1850, £5,250; Hawaiian Islands, 2 cents, 1851, £3,900; Mauritius, 1847, 2d. £2,338, 1d. £2,090; Baden, 9 kreuzer on green paper (error) £1,816; France, 1849, 15 cents, *tête-bêche*, pair £837; 1 franc (Vervelle) *tête-bêche* in a block of four, £2,706. Some of the little known United States postmaster's stamps also recorded high prices, e.g., Boscawen, 1846, 5 cent, £2,625; Lockport, 1846, 5 cent, £1,875. The price paid for the 1 cent British Guiana, 1856 (£7,343) is the highest price ever paid for a single stamp; the prices quoted for the 1d. and 2d. Mauritius have been exceeded at other sales, and one original envelope, bearing the two denominations used together to prepay a 3d. postage rate, was sold in 1922 for £11,000.

*War Time Developments.*—During the World War, philately, instead of declining as many thought it would, became enormously more popular; those who suspended their collecting soon found the strain of War conditions called for a mental relaxation, and returned to their stamps. Others, especially those brought into contact with the historic circumstances of the issue of stamps in the War zones and captured colonies, took up collecting with eagerness. Outstanding events of the War were marked for collectors by stamp issues of great interest, like the British and other War issues for Samoa, New Britain, Baghdad, Bushire and Togo. On the enemy side stamps were issued by the German and Austrian armies as they pushed through Belgium, France, Russia, Italy and the Balkans, and the public interest in these issues attracted numbers of new collectors, many of whom have maintained their enthusiasm, and some passed on to the advanced philatelic stage.

The period following the collapse of Austria and the Armistice was not less interesting or prolific. New stamps brought records of the independence of Finland, Poland and the Baltic states of Estonia, Latvia and Lithuania, the much divided Empires of Austria and Turkey, the incidents of the plebiscites, and the mandated territories, and even the League of Nations had a set of Swiss stamps overprinted in 1922.

*Aerophilately.*—Another phase of the pursuit which has attracted large numbers of new collectors is aerophilately, or, as some wish to call it, "aerophilosemy,"—the gathering together of air-post stamps, in which particular regard is paid to envelopes ("covers") which have been carried on air mails. Scarce stamps on envelopes or cards carried on historic flights like the transatlantic flights by Mr. Hawker (April 1919) and Sir J. Alcock (June 1919) command high prices. Elaborate catalogues have been published in Britain, France and Germany for the guidance of collectors in this branch of the pursuit.

Forgery remains a menace to the collector, but the advance of scientific knowledge of the old stamps places experts in a strong position with regard to the classic issues. The modern excess of surcharged or overprinted stamps, many of which were of a provisional and short-lived character, and consequently scarce, are the chief temptations to the counterfeiter where the overprints can be fairly closely imitated by modern photo-mechanical processes on the basis of genuine stamps. The expert committee of the Royal Philatelic Society decided in 1925 to discontinue undertaking to pass opinions on stamps issued subsequent to 1913.

*Organisation.*—Philatelic organisations are to be found in most countries. The Royal Philatelic Society celebrated its

jubilee (1919) by a scheme for acquiring a permanent home, possession of which was obtained in 1925. The Junior Philatelic Society, founded 1899, inaugurated a widespread movement which has extended throughout the Dominions and foreign countries, assisting the beginner and medium collector; it has organised the international philatelic exhibitions in London 1912 and 1923. Between 70 and 80 societies in Britain and the colonies are affiliated in the Philatelic Congress of Great Britain, which meets annually. America has its similar institutions headed by the Collectors' Club (New York) and flourishing societies in cities from Boston to San Francisco; in addition there is the American Philatelic Society, a national body holding an annual convention, and the Association for Stamp Exhibitions, Inc., which organised the international exhibitions in New York 1913 and 1926.

Governments now take a new regard for the requirements of stamp collectors. The "Philatelic Agency" was started by the United States as a department of its post office at Washington (1921) to supply current and such stamps of older kinds as may be available to collectors and dealers at face value; similar agencies were set up in Canada at Ottawa (1923) and at Balboa Heights, Canal Zone (1924). Some countries still produce stamp issues more frequently than is necessary for their postal requirements, looking to the revenue obtained from the sales, without postal service, to collectors. In many cases, commemorative issues of stamps are now issued on notable occasions in lieu of the ancient custom of striking of special coins, and in the main such issues add to the fascinating variety of historical and other subjects brought pictorially into association with stamp-collecting.

*BIBLIOGRAPHY.*—The bibliography of philately is very extensive. E. D. Bacon, *Catalogue of the Philatelic Library of the Earl of Crawford, K.T.*, published by the Philatelic Literature Society in 1911, with supplement in preparation (1926) lists all separate works known to 1908 and periodicals to 1906; this, the most complete library extant is in the British Museum, bequeathed by the late earl. Short selected bibliographies will be found in F. J. Melville, *Chats on Postage Stamps* (1911) and *The Complete Philatelist* (1924). *The Philatelic Index* (1925), issued by the Philatelic Congress of Great Britain, is a tentative index to the contents of the principal British stamp journals. See also S. C. Johnson, *The Stamp Collector* (1920); James E. Handshaw, *Looking Backward* (1923); *The Complete Standard Catalogue of the Postage Stamps of the World*, C. H. McKeel, ed. in 3 parts, St. Louis, (1894-5) and *The Standard Postage Stamp Catalogue* issued by Scott Stamp and Coin Co., Ltd., N.Y. (1923).

(F. J. M.)

**STANCIOFF, DIMITRI** (1864- ), Bulgarian diplomatist, was born at Sistov, Bulgaria, in May 1864, and studied at the Theresianum College, Vienna. In 1887 he entered the Foreign Office, Sofia, and was a member of the delegation entrusted with electing a ruler for Bulgaria. After the choice had fallen on Prince Ferdinand of Coburg, Stancioff became head of the new King's political Cabinet. Afterwards he was successively appointed Bulgarian representative at Bucharest, Vienna and St. Petersburg where he received the title of Minister Plenipotentiary and remained 10 years, succeeding in re-establishing friendly relations between Russia and Bulgaria. He became Minister of Foreign Affairs in 1906 and was for a time Prime Minister after the murder of Petkoff. In 1908 he resigned and became Minister in Paris where he remained until 1915 when he was sent to Rome. During the World War, against Bulgaria's participation in which on the side of the Central Powers he had vainly protested, he organised Red Cross and Ambulance work. After the Armistice, he was again called to the Foreign Office to resume relations with the Allies. He was a member of the Bulgarian Delegation to the Paris Peace Conference, and in 1920 was appointed Bulgaria's representative to the Court of St. James. Stancioff was Bulgaria's chief delegate to the first international Peace Conference in 1899 and was a permanent member of the International Court of Arbitration. After the World War he attended the Genoa, Hague and Lausanne Conferences. In 1889, he married the Countess Anna de Grenaud, lady-in-waiting to the princess Clementine of Orleans, mother of the ex-King Ferdinand.

**STANDARDISATION** may be defined as the art or process of securing or observing conformity to any measure whether of extent, quantity, quality or value, which has been established

by law, general usage or consent. These established measures are called standards. Examples are standard weights and measures (usually fixed by law); standard screw threads in the mechanical field; standard voltages in the electrical field; standard commercial forms, such as cheques, notes, contracts, invoices, etc., in business practice; standard track gauge in steam railway construction, and standard specifications for steel and other structural materials. Standards usually represent the final conclusions obtained through extensive experimentation and research and serve as a basis for comparison of one product with another, or of actual performance with ideal or desired performance. Standardisation has long been recognised as the foundation of mass production, and has been extensively applied in industries where volume output is the main purpose.

**Motor Car Manufacture.**—In 1910 the Society of Automotive Engineers in New York appointed a committee to set up standards which would simplify motor car manufacturing. This committee succeeded in establishing many standards for the automotive industry, and its work proved of great importance in the rapid growth of motor car production in America. S.A.E. standards include specifications as to sizes and dimensions of machined parts and fittings used in motor car construction, also to the materials of their composition, and to the tests by which the performance, durability and strength of such parts are determined. The widespread use of, or adherence to, these standards has made possible economies in designing, producing, operating and maintaining motor cars. These economies have helped to reduce the price to the consumer, and thus to make possible their wide distribution.

**Impetus During the War.**—Up to the time the United States entered the World War (April 1917) standardisation had been applied more extensively in the American motor car industry than in any other field of manufactured commodities. The great demand for munitions, rifles, machine guns, railway cars, ships and the thousands of other materials of modern warfare required the production of all these on a far greater scale than ever before attempted. It became necessary to divide the huge orders among many factories, and arrangements were made for one to furnish one part, another factory another, and so on. These units were then sent to centralising depôts for assembling and final delivery to the point of use or consumption. It was imperative that parts from several sources should be assembled with a minimum of labour. Consequently, standard gauges were made and distributed to the various shops for them to use in checking the accuracy of the parts made by them. It thus became possible to build motor-trucks, tractors, railway cars and locomotives, ships, big guns, shells and innumerable other essential products in enormous quantities. The impetus given to standardisation by war-time conditions has led to a rapid acceleration in the adoption of standards. There is scarcely a single American industry, operating on a large scale, that does not apply standardisation to its products, its processes, its plant equipment, its tools, jigs, dies, fixtures, even to its purchases of the materials used directly or indirectly in the fabrication of its products.

**Machine Tools and Shipbuilding.**—In 1921 the National Machine Tool Builders Association appointed a committee to co-operate with the American Society of Mechanical Engineers in establishing standards for various parts or features of machine tools. Consideration is being given to T-slots, spindle ends, angle blocks, tool holders, length of ways, bolts and nuts, and so on. Further study is being directed to the establishment of standard names for components now given a wide variety of names. It is being demonstrated that such standardisation is of great convenience to the manufacturer who uses many machine tools, in enabling him to interchange parts, reduce time lost by breakdowns, and thus expedite his own production.

In 1922 the American Marine Standards Committee was formed to promote the simplification and standardisation of practice in the building, operation and maintenance of ships and in the allied industries. This committee is composed of representatives of American shipbuilders, owners, operators, managers, as well as of engineering societies and Government departments. Among the components of ship construction for which the committee is developing standards are air ports, fixed lights, bitts, cleats, chocks, hawse pipes, marine hardware, life-boat fittings and equipment, fire buckets, propeller

hubs, piping, gauges, hose couplings, care and operation of boilers, superheaters, engine-room auxiliaries. The adopting of these standards and their incorporation in vessels now building, or to be built, is expected appreciably to reduce the cost of designing, construction, operation and maintenance.

**Mutual Standards in Industry.**—The trend toward standardisation in various industries led to the consideration of mutual or common standards, i.e., those which might be usefully applied in two or more industries. Groups which hitherto had acted more or less independently of one another in standardisation realised the need for co-operative action and for a centralising agency or clearing-house to co-ordinate and correlate their work. Consequently, the American Engineering Standards Committee was formed in Oct. 1918. In 1925 this organisation had 24 member bodies representing 35 national organisations. The main committee had approved, to Jan. 31 1925, 68 standards of a national character; 12 more were then awaiting approval, and 79 more projects were under way. Trade, technical or governmental bodies co-operating through representatives on special or sectional committees numbered 352, and there were 1,371 individuals on sectional committees.

Projects covered by the A.E.S.C. programme are divided as follows:—

| Group                                           | Projects |          | Group                            | Projects |          |
|-------------------------------------------------|----------|----------|----------------------------------|----------|----------|
|                                                 | Total    | Approved |                                  | Total    | Approved |
| Civil engineering and building trades . . . . . | 32       | 16       | Non-ferrous metallurgy . . . . . | 14       | 6        |
| Mechanical . . . . .                            | 26       | 10       | Chemical . . . . .               | 12       | 9        |
| Electrical . . . . .                            | 17       | 5        | Textile . . . . .                | 2        | 1        |
| Automotive . . . . .                            | 4        | 1        | Mining . . . . .                 | 16       | 1        |
| Transportation . . . . .                        | 9        | 6        | Wood . . . . .                   | 5        | 2        |
| Shipbuilding . . . . .                          | 1        | 0        | Pulp and paper . . . . .         | 1        | 0        |
| Ferrous metallurgy . . . . .                    | 9        | 7        | Miscellaneous . . . . .          | 11       | 4        |
|                                                 |          |          | Total . . . . .                  | 159      | 68       |

The American Engineering Standards Committee co-operates with the Federal Specifications Board, an organisation representing Government Departments, in the preparation of specifications relating to Government purchases of materials and supplies. It also co-operates with the standards committees of other nations in the promotion of international standards applying to manufactured goods. A further development in international standardisation occurred in the organisation of the Pan-American Standardisation Conference at Lima, Peru, in Dec. 1924. The general idea for this conference originated with the Latin-American countries.

**Government Action.**—Nation-wide interest in standardisation has been greatly quickened by the activities of the U.S. Department of Commerce. In 1921 the Secretary of Commerce, Herbert Hoover, established the Division of Simplified Practice to assist commercial organisations, chiefly trade associations, in the reduction of the variety in sizes and dimensions of the products in which their members were offering those products to the trade. It has been previously determined by a committee of eminent industrial engineers that the preventable waste in American industry was unduly high, and that much of this waste of material, labour, time and human energy came from the unwarranted fabrication of many non-essential varieties in the same class or type of goods. As an example, manufacturers of paving bricks were making 66 different types and styles of these articles. They found that 70% of their business came from 11 of the 66 varieties. They decided to eliminate the odd 55 and concentrate production, sale and use thereafter on the 11 staple varieties. This was done in Nov. 1921. In March 1922, the variety was cut to 7; a year later to 6; in March 1924 to 5; and in March 1925 to 4. This was accomplished through the mutual adoption by manufacturers, distributors and consumers of the reduced line of types and sizes as the basis of future business. The Department of Commerce acted solely as an intermediary in bringing about this result. The action was initiated, sponsored and carried through to completion by the industry.

**Simplification.**—This process of curtailing variety is called simplification to distinguish it from standardisation. The former is a commercial policy or procedure; the latter a technical process, often involving scientific research and investigation. Obviously, there is a relation between simplification and standardisation in that simplification, or the elimination of superfluous and unnecessary varieties in a common product, expedites

or facilitates standardisation. The varieties retained as the simplified line become the accepted standards of the industry, and may remain as "standards" until more adequate and acceptable standards are derived through scientific methods. Simplification is being applied in scores of industries with marked results. It is reducing inventories and idle investments, decreasing manufacturing and selling costs and likewise stimulating turnover, sales and volume production.

Examples of simplification effected are given in the following tables:—

TABLE I.

| Commodity                              | Number of sizes or varieties in use | Number Eliminated | Number Retained | Per cent Reduction |
|----------------------------------------|-------------------------------------|-------------------|-----------------|--------------------|
| <i>Iron, steel, and their products</i> |                                     |                   |                 |                    |

STANFORD, SIR CHARLES VILLIERS (1852–1924), British musical composer (see 25.773), died in London March 29 1924.

STANISLAVSKY, stage name of Constantine Sergeevich Alexeev (1863– ), Russian theatrical producer, was born in

Moscow. His father was a rich mill owner and his grandmother a French actress; he studied at the imperial school of dramatic art and in 1888 began work as an actor and producer in the Society of Art and Literature and after 10 years of training founded in 1898 together with the playwright V. N. Danchenko the Moscow Art Theatre. His productions were extremely varied, ranging from the historical *Csar Fedor* to the extreme naturalism of Chekhov's plays. He was also an actor of great force and subtlety, taking the leading parts in Chekhov's and Gorky's plays. Stanislavsky revolutionised the art of producing and is the acknowledged father of the modern Russian theatre. See Stanislavsky, *My Life in Art* (Eng. trans. 1924).

**STAR-CONTRA PROPELLER.**—The most efficient screw propeller is still far from perfect, owing to the fact that its action on the water is not wholly confined to thrust work in an axial direction, but is accompanied by a certain amount of power lost in giving the jet of water a rotary motion. The rotary or tangential force represents wasted energy, and the device about to be described has been evolved with a view of utilising that force in useful thrust work.

**Construction.**—The star is fitted in the propeller aperture, either on the fore or on the after side of the propeller proper, as circumstances allow. It consists of a solid casting secured firmly to the rudder post or ship's stern frame. If the device is fitted on the after side of the main propeller it is provided with two blades or fins projecting each side and of special shape. If on the forward side of the propeller proper, the star may consist of two fins rigidly secured to the ship's structure and which may or may not be fitted with outboard or side blades.

**Principle and Action.**—A ship's propeller causes the propeller stream to move in two directions. The axial movement is that which drives the ship; the tangential movement, that which causes the propeller stream to twist, is loss of power. The Contra propeller has been designed to eliminate this loss, and the results certainly show an increase of efficiency and economy. The water leaving the main propeller blades does so in a direction more or less perpendicular to the blade, but, when a star is provided behind the main propeller, the water flowing between its blades has its direction of flow changed until it is flowing astern in the line of the ship's course. If, however, the device is fitted forward of the main propeller, the water flowing through its blades has its direction changed before it reaches the main propeller. The star blades are so curved that just sufficient change of direction is given to prepare for and to counteract the rotary motion ordinarily given to the water by the main propeller. Since the one change of direction is just neutralised by the other, the water is thrown off the main propeller blades in a direct parallel to the course of the ship.

**Advantages of the Star-Contra Propeller.**—When fitted with side blades the device is a distinct protection for the main propeller, against other craft, floating or partially submerged objects, and when manoeuvring near dock walls. This particularly applies when working amongst floating ice. A vessel fitted with this device will develop the same speed, but will absorb from 7–10% less power, with consequent saving in bunkers and bunker space, and increase of deadweight cargo capacity. Manoeuvring is distinctly improved, as the increased solidity of the water after leaving the propeller area improves the efficiency of the rudder. The rudder bias is also largely reduced, consequently there is a saving in wear and tear on rudder gear, steering engine, chains, etc. The steering of the ship is improved; and in types having side blades the pitching and rolling is much less. As is well known the reduction of rolling and pitching in rough seas means an increase of speed. The vibration is reduced to a considerable extent as the water is less broken. Even with the most efficient propeller there still remains a considerable percentage of loss through slip, cavitation and other causes, which involves either reduced speed, or unnecessarily large oil or coal consumption. The device is suitable for every type of vessel, from ocean-going liners to small coasters and tugs, and even launches, either with single, twin, triple or quadruple screws driven by reciprocating, turbine, internal combustion or electrical drive. As

regards wooden vessels, the star is equally suitable. Pilot-boats, fishing and sailing craft with auxiliary machinery, should find the device of considerable assistance, as pitching and rolling can be considerably reduced by its installation. Finally, it must be borne in mind that after the initial cost there are no maintenance charges.

See Walter Pollock, "A suggested Method of Increasing the efficiency of the Screw Propeller," *Trans. hist. Naval Architects*, vol. 67, 1925. (Read at Spring Meeting, April 1925). (F. J. D.)

**STARK, JOHANNES** (1874- ), German physicist, was born April 15 1874 at Schichenhof in Bavaria and studied at the University of Munich. In 1900 he became an assistant at the University of Göttingen. He went as professor in 1907 to the Technische Hochschule at Aix-la-Chapelle, in 1917 to Greifswald and in 1920 to Würzburg. Stark devoted himself principally to the study of the modern theory of radiation and the atomic theory. He discovered the Doppler effect in parallel rays, for which the Vienna Academy awarded him the Baumgartner Prize. Later he discovered the Stark effect, named after him, and in 1919 was awarded the Nobel Prize for Physics. He wrote numerous essays on physical problems, including the *Prinzipien der Atomdynamik* in 3 parts (1910-5); *Die elektrischen Quanten*, *Die elektrische Strahlung*, and *Die Elektrizität in Gasen* (1902). He was the founder of the *Jahrbuch der Radioaktivität und Elektronik* (1904).

**STARS:** see ASTRONOMY.

**STATISTICS AND GRAPHS** (see 25.806).—Two classes of problems are presented in the examination and interpretation of groups of statistical data. The first is to determine the relation to one another of two series of quantities, the measurements of which have been recorded. The second is concerned with the comparison of the relations of different pairs of series. A simple illustration of the first is the quantity of rain falling at a given observing station during a determined interval of time. If the amounts of the rainfall be set out for each week in a year, the table showing these amounts will indicate the fluctuations in rainfall with the seasons.

Similar tables for other years, when compared with the first and with one another, will show that there is no precise uniformity in the recurrence of wet and dry periods, but if the records for each week in the year are averaged over a series of years, the contrasts between the wetter and drier seasons of the year will become clearer than in the record for a single year. Corresponding records for different places will serve to compare the relative wetness of their climates more accurately than can be done by a simple comparison of the annual rainfall. Observations for the same locality for different periods of time may show changes either in the amount of the annual rainfall or in its distribution through the year. As an illustration of a series of observations in which time is not one of the primary elements, variations with which are the subject of record, we may have a series of measurements of the heights and weights of men between determined limits of age. The average weight of all those whose height is within one-eighth of an inch of, say, 5 ft. 6 in. may be determined, and similarly for heights of 5 ft. 5½ in., 5 ft. 6¼ in., and each quarter inch less or more. A table setting out these results will summarise the relation of weight to height among the persons measured.

The study of the variation in magnitude of one of two observed quantities as the other changes naturally leads to the comparison of such variations determined for different phenomena. Thus, the comparison of the seasonal variation of rainfall or of temperature, and the seasonal variation of the death-rate, either in general or that consequent on a particular disease or group of diseases, suggests the question whether the variations of the two phenomena are similar, and similar in a degree which justifies the conclusion that there is a causal connection between them. Corresponding problems arise from comparisons between the tables showing the relations to one another of other pairs of observed quantities.

A large part of the work of recent years in the application of mathematical methods to statistics has been concerned with

devising appropriate methods of measuring and testing the degree of association between different series of variable quantities. Among the simpler tests of the closeness of association is the co-efficient of correlation. For the theory of correlation reference must be made to standard works on statistics. It will be sufficient here to indicate generally the mode of calculation of the co-efficient in the case of two variables. Taking two series of values for two quantities examined,

$$\begin{array}{l} x_1, x_2, x_3, \dots, x_n \\ y_1, y_2, y_3, \dots, y_n \end{array}$$

the  $x$ 's and  $y$ 's being measured in terms of units suitable to their nature, and denoting

$$\begin{array}{ll} x_1y_1 + x_2y_2 + x_3y_3 + \dots + x_ny_n & \text{by } \Sigma(xy) \\ x_1^2 + x_2^2 + x_3^2 + \dots + x_n^2 & \text{by } \Sigma(x^2) \\ y_1^2 + y_2^2 + y_3^2 + \dots + y_n^2 & \text{by } \Sigma(y^2) \end{array}$$

the value of  $r$ , the co-efficient of correlation between the  $x$ 's and  $y$ 's, is given by  $r = \Sigma(xy) / \sqrt{\Sigma(x^2) \cdot \Sigma(y^2)}$ . The values of  $r$  may range between  $+1$  and  $-1$ , these extreme values corresponding to a linear relation between each  $x$  and the corresponding  $y$  of the form  $ax + by + c = 0$ . For intermediate values of  $r$  such a linear relation does not connect the corresponding values of  $x$  and  $y$ .

Looking at the matter graphically, if  $x = f_1(u)$  and  $y = f_2(v)$ , the variations of  $x$  and  $y$  as  $u$  and  $v$  are given different values and may be represented in the usual way by tracing lines, of one of which the ordinates and abscissae have the series of values given to  $u$  and  $x$ , and of the other those of  $v$  and  $y$ . By a suitable choice of scales, the values of  $x$  corresponding to values  $a, 2a, 3a \dots$  for  $u$  may be made to fall vertically over or under those of  $y$ , which correspond to values  $b, 2b, 3b \dots$  for  $v$ . If the variations of  $x$  and  $y$  are associated, this graphic presentation of them may render the association visible. Such comparisons of the series of corresponding values of two quantities appear sometimes more convincing than the value of the co-efficient of correlation between them.

*Value of Graphs.*—The graphic method of presenting statistical data has advantages over the tabular statement of the same data, though it is necessary to remember that the facts represented cannot be more exactly represented by a diagram than by the data from which the diagram is constructed. The diagram may, indeed, on account of the limitations ordinarily governing the size of the sheets on which it is drawn and the accuracy of the draughtsman, fall short in accuracy of the statistical tables which it represents. The graphical presentation of such tables has, however, the important advantage that it presents lengthy series of data in a form in which the majority of users of them find it easier to grasp their sequence and their relations than when presented in tabular shape. Thus such a fact, or series of facts, as the variation of the rate of mortality with age appears as a mass of detail very difficult to grasp as a whole when presented in a table of figures; while many find a diagram, in which the rates are shown by the variations in the height of a line above a defined level, shown by a straight line crossing the page horizontally, not at all difficult to appreciate. As a series of observations may thus be represented and grasped with ease, two or more series may be compared with corresponding facility. For useful and effective comparisons attention needs to be paid to the scales on which the different series of numbers are represented.

An illustration is given by the late Professor A. Marshall, in the jubilee volume of the Royal Statistical Society,<sup>1</sup> in comparisons of the quantities of tea and sugar consumed per head of the population of the United Kingdom in a series of years. When both quantities are represented in pounds, the growing use of sugar is clearly manifest, while the consumption of tea appears to have varied little. When the unit of measurement of tea is taken as an ounce, however, the fact that the relative expansion of tea consumed per head was comparable with that of sugar is made clear. Fig. 1 is constructed from data for the 50 years preceding the War similar to those used by Marshall.

<sup>1</sup> *Loc. cit.*, p. 257 (fig. 2).

FIG. 1.—Graph showing consumption per head of tea and sugar in the United Kingdom in each year 1864-1913. (Quantities in stock at the end of each year are not taken into account.)

When, of two (or more) curves compared, one represents quantities which increase from left to right of the diagram, though at varying rates, while another shows fluctuations about a line which is, on the whole, horizontal or falling, a correspondence between the two curves may not be easily recognised, even if it be real and close. To bring out the association it may be necessary to adopt a procedure which separates the general trend of the line and the deviations of individual points on the line from that trend. One such method is to calculate the averages of the ordinates of several consecutive points. The line which shows the position of such a series of averages, and the line which shows the deviation of any point from the average of the series to which it corresponds—say, the series which extends equally the right and left of the selected point—may show movements well worthy of separate attention.

It may appear, for example, that even if the lines showing the general trends are far from similar in their variations, the lines

which show the deviations from the trends manifest variations having marked features of resemblance for different curves. The marriage rate and the value of foreign trade per head for the United Kingdom furnish an example where the deviations from nine-year averages appear much more clearly similar in their fluctuations than the single-year figures. Fig. 2 shows the deviations for each year 1859-1909 from the averages of the nine-year periods 1855-63 to 1905-13, the marriage rates being those of Great Britain and the foreign trade being represented by the sum of the retained imports and the exports of domestic produce.

Further, the comparison of such deviations suggests that, whatever the causes which underlie the apparent similarity of the variability, they do not produce their effect simultaneously on the two phenomena measured. The maxima and minima of the marriage rate, when examined more closely, occur some months later than those of trade.<sup>1</sup> The association can be tested by the calculation of co-efficients of correlation for different intervals between the points on one curve and the corresponding points on the other; thus the interval for which the co-efficient has highest value may be determined with some precision.

In examining two relations, such as those represented above by  $x = f_1(u)$  in and  $y = f_2(v)$ , the nature of the phenomena may be rendered clearer in some cases by the adoption of appropriate transformations before bringing together the various data to be compared. Thus, if  $p = F_1(\bar{x})$  and  $q = F_2(u)$ , the relation  $x = f_1(u)$  may be represented by a relation between  $p$  and  $q$ , say,  $p = F(q)$ . Similarly, if  $r = F_1(y)$  and  $s = F_2(v)$ , the relation  $y = f_2(v)$ , expressed as a relation between  $r$  and  $s$ , may become  $r = F(s)$ . We can thus obtain, for comparison, graphs of the variations of  $p$  and  $r$  as  $q$  and  $s$  vary, and, if the transformations have been suitably chosen with reference to the data to be examined, the new series may reveal relations not clearly manifest from the examination of those from which they were derived. It is not, however, necessary to devote much space to such means of analyzing results in special cases, the general principle underlying them being sufficiently obvious.

As shown in the article PROBABILITY (22.376) the measurements of many phenomena, physical or social, are found to be

<sup>1</sup> R. H. Hooker, "Correlation of the Marriage Rate with Trade," *cf. Journal of the Royal Statistical Society* (Sept. 1901).

FIG. 2.—Deviations from nine-year averages. Upper graph: Value of foreign trade (net imports and British exports) of the United Kingdom per head of population. Lower graph: Marriage rate in Great Britain 1859-1909 (averages of 1855-63 to 1905-13).

distributed about their average in close accordance with the theoretic distribution of events dependent on pure chance, subject to the qualification that, in social phenomena, the normal evenly balanced distribution of events on either side of their mean is frequently replaced by a distribution leaning more or less markedly to one side or the other. In the actual process of taking observations of a series of phenomena, we may fail to secure measurements of that representative character possessed by the mean of a large number of observations repeated under conditions as nearly as possible identical in all respects. Most commonly we have to be satisfied with a single observation or a limited series of observations. If we could obtain the true means as the values of the  $x$ 's and  $y$ 's whose fluctuations it is proposed to compare, we might either find that a marked resemblance of the two curves would replace a vague similarity, or that an apparent similarity would be replaced by a definite independence.

Further, the actual statistics obtained to represent a series of observations may be either a random or a biased selection from the varied possible measurements. It is a serious weakness of many social statistics that the data available are commonly based on a limited series of observations of the consequences resulting from the operation of specified forces, and that limited series is too often affected by conditions which prejudice the representative character of the statistics. If this defect be serious, it may be of doubtful advantage to apply to such data those methods of analysis which might be wholly appropriate to data derived from the repetition of carefully controlled observations of physical or mechanical phenomena. As shown in a paper by Mr. Udney Yule, there may arise, from random sampling of possible data, series which appear to show, between phenomena wholly unrelated, a comparatively high degree of correlation as measured in the usual manner.<sup>1</sup>

The improvement of the data available for statistical analysis is thus of an importance not less than that of the improvement of the methods of analysis and comparison of the data obtained. Considerable advances have been made in this direction in recent years. In comparing two sets, one distant, one recent, of statistical data it is necessary to guard against conclusions which may be invalidated by the inferior reliability, for the particular purpose in hand, of the older data. One great advantage of much of the later statistical material is that the conditions of its preparation, conditions which permit of a judgment as to its reliability or its applicability in particular arguments, are more usually set out with care than was formerly the practice. In many cases it has been necessary to commence a statistical series with imperfect data, the improvement of the data being only possible as the value of data of that character became recognised.

#### UTILITY IN COMMERCE AND INDUSTRY

The value of statistics for business purposes has been appreciated to an increasing degree, and thus an increasing flow of statistical data, which yet leaves much to be desired, has become available for the study of commercial, industrial and other social problems. The movements of prices in Great Britain as reflected in index numbers, for example, are made the subject of regular compilations, not only by *The Economist* and *The Statist*, but by *The Times* and *The Financial Times*. While the three first of these adhere to the formally more simple method of averaging the items by the addition and division of their sum by the number of items, the last, like the index of the Board of Trade, which has a wider range of sources of data than any of the others, makes use of the geometric means of the items, as was done in the index by Jevons for the period 1782-1869 (cf. W. Stanley Jevons, *Investigations in Currency and Finance*, ed. 2, pp. 112-50).

In the United States an even greater variety of compilations of general price indices is available than in England, while in both countries there are a number of compilations limited to the prices of specified groups of commodities. The use of index numbers of prices has extended, since the War, to a much wider

range of countries than formerly, partly under the influence of the statistical work of the League of Nations.<sup>2</sup>

In the analysis of statistics related to the variations of business activity and prosperity, it appears to have been established that the ebb and flow of different phases of that activity are not simultaneous but follow one another with more or less regularity. Considerable attention is being devoted to the selection of data which may represent most satisfactorily the fluctuations in these different features of the ebb and flow of business, with a view to the establishment of a species of economic meteorology.

*Work of International Organisations.*—Graphical presentations of the variations of such trade indicators are regularly prepared and circulated by, among others, the organisations known as the Harvard Economic Service<sup>3</sup> in the United States, and the London and Cambridge Economic Service in Great Britain, the former having the longer record of work, and in France, Italy and Germany the carrying out of a similar programme has been taken in hand. The work of the International Statistical Institute in promoting comparability between the official statistics of different countries was interrupted after the meeting held at Vienna in 1913, except in so far as the establishment of a permanent office at The Hague, finally approved at that meeting, led to the collection of certain statistical material from many countries for publication under the auspices of the Institute in the bulletin of the new office.

By the time that serious activities of that office had become possible, the new organisation for international co-operation, the League of Nations, was becoming active in the field of statistics. The League and the Institute have worked in co-operation through a preparatory committee jointly appointed by the two organisations to survey various portions of the field of commercial and industrial statistics. The reports prepared by this joint committee have furnished a large part of the material presented for discussion at the first meeting of the Institute held after the War, namely, that at Brussels in 1923, and also at the meeting of 1925 at Rome.<sup>4</sup> The regular series of biennial meetings of the Institute is now definitely re-established, and the vacancies in its membership which occurred in the ten years of suspended activity are in large measure filled.

**STEAD, WILLIAM THOMAS** (1849-1912), British journalist (see 25.817), was drowned on the "Titanic" April 15 1912.

**STEAM ENGINE** (see 25.818).—The article in Vol. 25 traces the history of the steam engine along its two lines of development, as a reciprocating engine and as a turbine—the engine of Watt and the engine of Parsons: it also includes a sketch of the thermodynamic theory which governs both.

The turbine form of steam engine long since established itself as a successful rival to the reciprocating or piston and cylinder form, especially in two great fields—marine propulsion and the generation of electrical power for distribution from central stations. Much the most important steam turbine has been of the compound reaction type, originated by Sir Charles Parsons and developed by him into a prime mover of great power and high efficiency. In Parsons' turbine the principle was for the first time practically applied of dividing the whole heat-drop, from boiler to condenser, into a large number of successive stages. At each stage the steam acquires a moderate velocity by undergoing a small fall of pressure in a row of converging passages or nozzles, and gives up the momentum so acquired to blades mounted on a revolving drum or "rotor."

In Parsons' turbine, as is explained in Vol. 25 (p. 845), rows of moving blades on the rotor alternate with precisely similar rows of fixed blades projecting inwards from the case or cylinder in which it is enclosed; they are so shaped that the steam suffers

<sup>2</sup> See *Memorandum on Currency and Central Banks*, 1913-24, issued by the League of Nations.

<sup>3</sup> These organisations issue to their subscribers the publications containing the data and charts referred to.

<sup>1</sup> *Jour. Roy. Stat. Soc.* (Jan. 1926), Presidential address by G. Udney Yule, "Why do we sometimes get nonsense correlations between time-series?"

<sup>4</sup> *Institut International de Statistique. Bulletin*, Tomes 21, 22, 1924 and 1926.

substantially equal drops of pressure in both, and acquires equal amounts of relative velocity. Later the principle of using many compounded stages was successfully applied to the impulse type of turbine by Rateau and others, producing a machine which also has successive groups of fixed nozzles alternating with rows of moving blades, but the action on the moving blades is in general one of pure impulse: in the moving blade passages there is no drop of pressure, consequently there is no gain of relative velocity and no reaction in the sense in which that word is used when one speaks of a Parsons' turbine.

*Electric Power Stations.*—In recent years the compound impulse turbine has been brought, in the hands of various makers, to a high degree of efficiency, though not exceeding that of Parsons' reaction turbine. Both types are now in very extensive use, especially in electrical power stations where great numbers of powerful turbines are installed. Many of these develop individually as much as 30,000 kw., and some 50,000 kw., or even more. For such service the turbine is as a rule directly coupled to an alternating-current dynamo. A common speed is 3,000 r.p.m. in turbines of moderate output, or 1,500 in the larger sizes. In turbines of 20,000 kw. or over, it is usual to divide the expansion between two or more separate cylinders, to avoid the use of an unduly long enclosed rotor, and to escape difficulties that might arise from too wide a range of temperature in different parts of the rotor and the enclosing case. Often the two cylinders are arranged in tandem with their rotor shafts in one straight line, mechanically coupled to rotate as one shaft. In some recent instances the high-pressure cylinder is of the impulse type and the low-pressure cylinder of the reaction type. For central station use, the steam turbine has entirely displaced the reciprocating engine, and has achieved an economy of fuel of which that engine is quite incapable. Apart from its higher efficiency, its relatively small bulk, in relation to the power developed, and the convenience with which it is handled in running give it a marked advantage.

*Marine Engineering.*—In its original application to ship propulsion, the turbine was directly coupled to the propeller shaft, but this arrangement had a serious drawback. To work efficiently, a screw propeller must run at a speed much lower than that which is suitable to the shaft of a turbine. In fast ships the discrepancy is of course less than in slow ships; this consideration practically restricted the early marine use of the turbine to ocean liners, war ships and other fast vessels. Even in them there had to be a compromise: the propeller was designed to make an abnormally large number of turns per min. at some sacrifice of propulsive efficiency, and the turbine had to be designed for an abnormally low speed on the part of the shaft. The low speed of revolution, even with great enlargement of the rotor drums and multiplication of the number of blade rings, seriously hampered its thermodynamic efficiency. Notwithstanding this handicap, the advantage of the turbine in marine use was so conspicuous that in the 10 years from 1906 to 1916 direct coupled marine turbines to an aggregate of 14,000,000 H.P. were supplied by Parsons and his licensees for the propulsion of ships, taking the place of triple or quadruple expansion engines of the reciprocating class.

*Improved Designs.*—Meanwhile, however, Parsons had made a new departure which was to render the direct-coupled marine turbine obsolete. Realising that the turbine should be freed from the limitation of speed which is imposed by the propeller, he set himself to improve methods of gear-cutting so that the large powers involved in marine propulsion might be successfully transmitted through a reducing gear, which would allow the turbine shaft to run much faster than the propeller shaft. He demonstrated the practicability and the great advantage of such gearing by a large scale experiment on the steamer "Vespasian" in 1910. There gearing was interposed between the turbine and the propeller, a pair of pinions five in. in diameter on the turbine shafts driving a wheel 99½ in. in diameter on the propeller shaft through helically cut teeth on which jets of oil were continuously sprayed. The gear showed itself to be durable as well as efficient, absorbing only about 2% of the transmitted

power. Geared marine turbines soon made a rapid advance; they are now employed to the exclusion of direct coupled marine turbines in all modern designs. Up to the end of 1925 they have been supplied to the extent of over 16,000,000 horsepower.

In many turbine driven ships, including all the vessels of the British Navy, single reduction gears are used, with a speed ratio which may be as high as 20, but recent practice in the mercantile marine prefers double reduction gearing in which a total speed ratio of 40 or so is reached in two steps through the use of short intermediate gear shafts. In a recent design of a double-geared marine turbine of 5,000 H.P., to drive a single screw propeller, steam is supplied at a pressure of 500 lb. per sq. in., superheated to 700° Fahrenheit. This is expanded successively in three cylinders of the turbine (high, intermediate and low pressure), the shafts of which run respectively at 5,000, 3,000 and 1,700 revolutions per min., and carry pinions that gear with two short second-motion shafts driving a central propeller shaft at 90 revolutions. With such an installation the consumption of steam is probably less than 8 lb. per H.P. per hour, and the propulsive effect for each lb. of coal, in normal working, is about doubled in comparison with what was usual a few years ago.

The successful application of gearing has opened up for the steam turbine many additional fields of usefulness, as a prime mover in factories, rolling-mills, paper works and so forth, where the shafting or machine to be driven is required to run at a speed much lower than would be suitable for the turbine shaft.

It is unnecessary to describe here in any detail the forms taken by steam turbines, or state the principles which govern the design of their blading, in order to secure that the hydraulic efficiency at each stage shall be high, and that as large a fraction as is possible of the adiabatic heat-drop shall be converted into useful work (see TURBINES).

*Thermodynamic Efficiency.*—The adiabatic heat-drop is a matter of primary importance in determining the limit of performance of any steam engine, whether of the reciprocating or the turbine class. It is measured by the change in the total heat function (see 25.825) which the steam would undergo if it expanded adiabatically from the condition as to pressure and temperature at which it is supplied to the final condition of pressure in the condenser. This represents the greatest amount of work which is theoretically obtainable, per lb. of operative steam, under ideally favourable conditions, in a steam engine of any type, so long as the engine follows the "Rankine cycle" (see 25.827). Under the conditions of actual practice the effective work may amount to about three-fourths of this quantity. For the convenience of designers, tables of the adiabatic heat-drop between various stated conditions of supply and exhaust have been calculated and published, on the basis of Callendar's Tables of the Properties of Steam.

Any improvement in the thermodynamic efficiency of a steam engine may proceed on three more or less distinct lines:—

(1) By making the actual process of expansion conform more closely to the adiabatic ideal, thereby obtaining a larger fraction of the heat-drop in the form of useful work. This fraction is called the "efficiency ratio."

(2) By increasing the range of temperature through which the engine works, which may be done either: (a) by raising the pressure and temperature of the supply; or (b) by lowering the pressure (and consequently also the temperature) in the condenser.

(3) By departing from the Rankine Cycle and making the operation of the engine approach more nearly to the Carnot Cycle, which represents the extreme limit of efficiency in the possible relation of work done to heat supplied, when every part of the thermodynamic cycle, including the return of the working fluid to the boiler, is carried out in a strictly reversible manner.

All these lines of development are found in recent practice. They have led to features, some of which call for particular notice, that are characteristic of present tendencies in design.

*Blade Design.*—The heat-drop is more fully utilised in turbines by better blade design, by avoidance of leakage past the blades, by using blade speeds which are generally higher and are more favourably related to the speed at which the steam issues from the nozzles; also by providing large areas for the passage of steam through the last rows of the blading and for its discharge to the

condenser, so that the last stages in the expansion may be utilised, and that the great volume to which the steam has then expanded may be passed without too high a leaving velocity.

*Superheating.*—Another factor which makes for an efficient use of the heat-drop is super-heating. It is now an ordinary feature of turbine practice to superheat the steam to a temperature approaching  $700^{\circ}\text{F.}$ : an important effect of this is to reduce frictional losses, and so improve the efficiency ratio by keeping the steam dry throughout a large part of the expansion. This advantage can be still more completely secured when reheating is resorted to, which means that the steam is removed after expanding to an intermediate stage, and is passed through pipes which reheat it to a high temperature. It is then returned to the engine to complete its expansion. By this means the steam can be kept dry throughout the whole or nearly the whole of its action. Reheating in this sense is used in the most efficient modern power stations. On the large scale, and as a feature of steam turbine practice, it is novel, but it was used some 25 years ago by W. Schmidt in compound reciprocating engines, where the practicability and the advantage of high superheat were for the first time clearly demonstrated (see 25.829). Schmidt's method was to reheat the partially expanded steam by bringing it into thermal contact with the highly superheated high-pressure supply in a receiver between the two cylinders. The plan adopted in power stations is to take the steam back to the boiler house for direct reheating by the furnace gases. It must be recognised that this involves losses by radiation and otherwise which may go far to reduce the net advantage.

*Boiler Pressure.*—A high degree of initial superheat has the further merit that it raises the average temperature at which heat is taken in, and so increases the effective thermodynamic range. An advantage of like kind, but greater in amount, can be secured by substantially raising the boiler pressure, and this is a conspicuous feature of modern practice. In recently erected power stations pressures of 500 or 600 lb. per sq. in. are not uncommon, and experiments with pressures of 1,200 and even 1,500 lb. are in progress. Even with the highest pressures that are practicable the temperature of the steam may advantageously be raised by initial superheating up to the highest level which the materials will safely stand.

*Condenser Design.*—At the other end of the process, the pressure in the condenser is limited by the vapour pressure of the available cooling water. A very close approach to this limit is secured in practice, in the large surface condensers which form part of power-station plants, by the methods which are now used for the extraction of air and residual vapour. The gaseous contents of the condenser are usually removed by a combination of two steam-jet ejectors, working in series, which entrain it and discharge it against atmospheric pressure, through an expanding nozzle in which it gains pressure by losing velocity. The liquid condensate is removed by a separate pump, often of the centrifugal type. By this combination a much better vacuum is readily maintained than was practicable in the days of the old-fashioned air-pump, which removed the condensate and the air and vapour together. The condenser pressure is reduced to one inch or even three-quarters of an inch of mercury. To keep a good vacuum is specially important in turbine plants, for the turbine can make full use of the very last stages of expansion, and the large volume which the steam has makes even a small fall of pressure contribute substantially to the total quantity of work that is done.

*Feed Water Improvements.*—The Rankine cycle (see 25.827) is thermodynamically less efficient than the completely reversible cycle of Carnot, because it includes an irreversible transfer of heat to the feed-water in raising it from the temperature of the condenser to that of the boiler. This irreversible feature can be more or less completely eliminated by a device, which has recently become usual in turbine plants which aim at high thermal economy. Steam is "bled" from the turbine at several points, at a series of intermediate temperatures, and is used to heat the feed-water step by step in a corresponding series of feed-heaters, through which it passes on its way from the condenser to the boiler. If the number of such steps were

indefinitely increased the process of feed-heating would become completely reversible; by providing even three or four steps a good approximation to reversibility is reached. The arrangement is known as regenerative or cascade feed-heating or feed-heating by bleeding.

If the steam were not superheated, and the feed-heating were made reversible, the cycle (with an infinitely large number of steps in the feed-heating process) would become that of Carnot, for all the heat which the working substance receives would then be taken in at the upper limit of temperature, and all the heat it rejects would be rejected at the lower limit, the cycle being completed by two reversible processes, namely adiabatic expansion from the upper to the lower limit on one side, and regenerative return from the lower to the upper limit on the other.

Superheating involves, in practice, a departure from this cycle, by raising the temperature of the steam to a higher level than that at which the chief part of its heat has been received. A limit of temperature beyond which superheating cannot be carried is imposed by considerations relating to the strength and endurance of the materials of which engines are built. With such superheats as are common, cast steel has to be used in the earlier stages of the expansion, cast iron having been found to undergo a progressive growth or change of form when brought into repeated contact with steam at any temperature near the top of the range. The limit of superheating at present recognised as practicable is about  $750^{\circ}\text{F.}$ , or  $400^{\circ}\text{Centigrade}$ . Although superheating prevents the cycle of operations from conforming strictly to that of Carnot, it raises the efficiency, partly by increasing the average temperature range, but mainly, as was explained above, by keeping the steam dry.

*Modern Examples.*—In illustration of these features of modern practice, reference may be made to the steam turbine plant of the North Tees Power Station, planned by Messrs. Merz & McClellan, where there is reheating of the steam during its expansion, and also regenerative heating of the feed-water. The boiler pressure is 475 lb. per sq. in. and the steam is initially superheated to a stop-valve temperature of  $650^{\circ}\text{F.}$  It expands in the high-pressure turbine to 65 lb. and is then returned to the boiler house where it is reheated to  $500^{\circ}\text{F.}$ , before expanding in the low-pressure turbine to a pressure of 0.39 lb. (vacuum  $29\frac{1}{2}$  inches). Although this reheating involves the taking in of supplementary heat at a temperature on the whole lower than that at which the main supply of heat is received, it materially improves the action by preventing the steam from becoming wet in the low-pressure turbine. The condensate, on its way back to the boiler, picks up what heat is available from steam drains and gland leakage, and also passes through three cascade feed-heaters to which steam is bled from three suitable points in the turbine, with the effect that its temperature is raised  $300^{\circ}\text{Fahrenheit}$ .

A more recent example, of greater size and still higher thermodynamic efficiency, is afforded by a turbine of 50,000 kw. normal output, supplied by Sir Charles Parsons' firm in 1925 to the Crawford Avenue Power Station, Chicago. This plant has three cylinders through which the steam passes in series, each with its own alternator. Steam is generated at 600 lb. per sq. in., and reaches the stop-valve with a gauge pressure of 550 pounds. It expands in the first or high-pressure cylinder of the turbine through 36 stages down to a pressure of 100 lb., and is then passed through a reheater, returning to the intermediate cylinder at  $700^{\circ}\text{Fahrenheit}$ . There it expands through 23 stages to a gauge pressure of about 2 lb.; it then passes to the low-pressure cylinder where it expands through five more stages (making 64 in all) and is finally discharged to a condenser in which the vacuum is maintained at  $29\frac{1}{2}$  in. (barometer 30 inches). The low-pressure cylinder is set coaxially with the intermediate-pressure cylinder, and the steam passes from one to the other through a large conical connecting passage with the least possible disturbance of the flow, in order that its carry-over energy of motion may be conserved.

The low-pressure cylinder exhausts through very short direct passages of great sectional area into a pair of twin condensers with vertical tubes, one on either side of the shaft, providing

together a condensing surface of 56,000 sq. feet. Steam is bled from the turbine at three places for regenerative heating of the condensate on its way back to the boiler; the water is thereby heated in three steps to 315° Fahrenheit. Heat from the flue gases is used to give a further stage of feed-heating, and also to warm the air-supply to the furnaces. The shafts of the high-pressure and intermediate-pressure turbines run at 1,800 revolutions per minute, that of the low-pressure turbine at 720. The highest blade-tip velocity is 760 ft. per second. With this plant about 33% of the heat supplied to the steam, or fully 27% of the energy of the fuel, should be converted into electrical energy. Parsons estimates that by raising the pressure of supply to 1,500 lb. per sq. in. the latter figure would be increased to 30.2%.<sup>1</sup>

**The Reciprocating Engine.**—The growth and improvement of the steam turbine and the wide extension of its use, have formed the outstanding feature of the period now under review. With respect to the reciprocating engine regarded separately there is little that need be said. It has shared in the advantages that have come from the general use of superheating, and in some degree from the use of higher pressure. Though displaced by the steam turbine where great amounts of power are concerned, it continues to find much application in moderate as well as small sizes, both on land and as a marine engine. Many vertical triple and quadruple expansion engines, working at pressures of 200 lb. or thereabouts, continue to be fitted on board ship, especially when the speed of the vessel is subject to variation, or the possibilities of local repair have to be particularly considered. For locomotion on railways the reciprocating engine holds undisturbed possession of the field. Attempts have been made to apply the turbine to this use, but they have not gone beyond the stage of experiment (see RAILWAY CONSTRUCTION; LOCOMOTIVE DESIGN).

Compound locomotives, extensively used on the continent of Europe, are less generally favoured on English railways, though they have the support, based on experience, of more than one prominent locomotive engineer. "Superheating in locomotives is now a standard practice: to effect it the method initiated by Schmidt is employed: a certain proportion of the tubes which convey the hot gases through the boiler from the fire-box to the smoke-box are given a comparatively large diameter (4 or 5 in.) and within each of these a long superheater tube is inserted which is bent back on itself three times; its ends are brought out side by side, and are connected to two headers on the steam supply. By means of the headers these superheater tubes are connected in parallel, so that together they form part of the channel which the steam must traverse on its way from the steam space of the boiler to the cylinders.

Mainly with the object of giving the locomotive more power, three or four cylinders are frequently used instead of two cylinders. With two cylinders the cranks are placed at right angles and the driving effort is subject to wide fluctuations during the revolution of the driving wheels. With three cylinders, set at 120° apart, a much more uniform effort is obtained, and incidentally the variations of vertical force on the rails, due to imperfect dynamical balance of the revolving parts, are greatly reduced. Recent investigations by a special Research Committee on the stresses produced on railway bridges by moving loads have shown that in long bridges these variations of vertical force are the main factor in setting the bridge vibrating and thereby causing the moving load to produce augmented stresses in the members. This consideration may be expected to emphasise the preference, already felt on other grounds, for the three-cylinder type.

The increased use of superheating in engines of all sorts has done much to reduce what is a serious defect of reciprocating engines in general—the thermodynamic waste that occurs through transfers of heat between the working fluid and the metal of the cylinder (see 25.828). Superheating makes the transfer of heat comparatively difficult by keeping the steam more nearly dry. The waste arises largely from the fact that in an engine

of any usual design the same surfaces are brought alternately into contact with hot and comparatively cold steam. To obviate this in some degree an interesting type has been introduced called the "Uniflow" engine, which completely separates the admission from the exhaust. The exhaust ports are at the middle of a long cylinder and the admission ports are at both ends, the engine being double-acting. There is no separate exhaust valve; the piston itself causes the release of steam by uncovering the central ports as it approaches the end of its stroke. The piston is nearly half as long as the cylinder and only a little shorter than the stroke.

The effect is that the cylinder ends, containing as they do steam chests of live steam, are both kept hot with very little fluctuation of temperature, while the middle region remains continuously at a comparatively low temperature since it comes into contact only with steam that is at or near release. The admission is controlled by drop valves; the clearance spaces are very small; the cut off is early, and a high ratio of expansion is achieved in a single cylinder. Engines of the "Uniflow" type are now extensively used for such purposes as driving factories, and tests show that, for their size, they have a remarkably good thermal efficiency, especially when the steam has a fairly large amount of superheat. There is still enough exchange of heat between the working substance and the metal to make superheating highly advantageous.

(J. A. E.)

**STEED, HENRY WICKHAM** (1871– ), British journalist, was born Oct. 10 1871 at Long Melford, Suffolk. He studied economics, philosophy and history at Jena, Berlin and Paris universities, and in 1896 joined the staff of *The Times* as acting correspondent in Berlin, and was appointed correspondent in Rome in 1897. Transferred thence to Vienna in 1902 as correspondent for Austria-Hungary, he remained there until 1913 when he returned to London, and was appointed foreign editor of *The Times*, in Jan. 1914. In 1913 he published *The Habsburg Monarchy*, in which the internal condition of Austria-Hungary was critically examined and the possibility of a European war discussed. During the World War Mr. Steed, was mainly responsible for the foreign policy of *The Times* and, in 1918, was chosen to frame the policy of Lord Northcliffe's Department for Propaganda in Enemy Countries. In this capacity he was sent on an official mission to the Italian front where he was authorised by the Allied Govts. to promise independence to the subject Habsburg peoples. He helped also to arrange, in April 1918, the Rome Congress of the oppressed Austro-Hungarian races. In Feb. 1919 he was appointed editor of *The Times* in succession to Mr. Geoffrey Dawson, and held this post until Nov. 1922. After relinquishing the editorship of *The Times* Mr. Steed published *Through Thirty Years*, in which he related his experiences of European politics between 1892 and 1922. In 1923 he acquired the control of *The Review of Reviews*, of which he became editor.

**STEEL:** see IRON and STEEL; RUSTLESS STEEL.

**STEFÁNSSON, VILHJÁLMUR** (1879– ), arctic explorer, was born Nov. 3 1879 at Arnes, Manitoba, of Icelandic parents. He graduated from the University of Iowa and studied for a while at Harvard university. After two archaeological voyages to Iceland in 1904 and 1905 he turned to arctic research. In 1906–7 he was a member of the Mikkelsen ethnological expedition to the Eskimo tribes of the mouth of Mackenzie river and Northern Alaska, and in 1908–12 he went on another expedition to the arctic regions north of Canada, where he discovered several unknown Eskimo tribes. In 1913 he was made commander of the Canadian arctic expedition undertaken under the auspices of the Canadian Government. During the six years 1912–8 he explored vast regions north of Canada and Alaska, wandering for months on moving ice, accompanied by two or three companions. He discovered a new land north of Prince Patrick Island in 1915, and in 1916 another new land, west of Axel Heiberg Island. In 1918 he explored the Beaufort Sea, disproving the existence of the so-called Keenan Land. Stefánsson laid

<sup>1</sup> Parsons on Steam Turbines, *Trans. of the First World Power Conference* (1924), vol. 2, p. 1477.

great stress on the economic value of the arctic regions, chiefly as meat supplying countries, and by his advice reindeer were successfully introduced in some of the arctic regions where they were not found before. After his return he received the thanks of the Canadian privy council and was awarded the founder's medal of the Royal Geographical Society.

His principal publications are: *My Life with the Eskimo* (1913); *Anthropological Report* (1914); *The Friendly Arctic* (1921); *The Northward Course of Empire* (1922); *Hunters of the Great North* (1922); *Kak the Eskimo* (1924); *The Adventure of Wrangel Island* (1926).

**STEIN, SIR MARC AUREL** (1862– ), British archaeologist, was born at Budapest Nov. 26 1862. Educated at Budapest and Dresden and at the Universities of Vienna and Tübingen, he went to England for further study and then to India, where he became principal of the Oriental College, Lahore, and registrar of the Punjab University in 1888. He was appointed in 1899 to the Indian Education Service, and for the next two years carried out archaeological explorations for the Indian Govt. in Chinese Turkistan. In 1906–8 he made further explorations (see 27.425) in central Asia and western China, receiving the gold medal of the Royal Geographical Society. From 1910 he was superintendent of the Indian Archaeological Survey, and in 1913–6 carried out explorations in Persia and central Asia, described by him in *The Geographical Journal* (1916). He was created K.C.I.E. in 1912. In 1926 he continued his explorations on the Northwest Frontier and has identified the site of Aornus (see 1.548) thus correcting Abbott's view. His other publications include *Chronicle of Kings of Kashmir* (1900); *Ancient Khotan* (1907) and *Ruins of Desert Cathay* (1912).

**STEINER, RUDOLF** (1861–1925), German philosopher, was born Feb. 27 1861 at Kraljevic, Austria, the son of a small railway employee. From 1890 to 1897 he worked in Weimar at the "Goethe-Schiller Archive," editing Goethe's works on natural history. In 1902 the German section of the theosophic association was founded and Steiner was called upon to become its spiritual leader. As such he developed for some years an astonishing activity as regards lectures and writings, but then became opposed to theosophy altogether, and was therefore excluded from the theosophical centre under English leadership. Steiner now developed his own teaching in a series of writings. He called this "anthroposophy," i.e., wisdom of humanity: mankind is regarded as the centre of all perceptions of this "spiritual science," and an attempt is made to deduce the nature of the world from the nature of humanity. In 1913 the Anthroposophical society was formed to further spiritual research on Steiner's principles. In order to try his educational and political views in practice, Steiner founded the Waldorf School, near Stuttgart, and the "free high school for spiritual science" known as the "Goetheanum" at Dornach near Basle, which was burnt a few years later. All Steiner's works are published by the *Philosophisch-anthroposophischer Verlag*, Berlin, and by *Der kommende Tag*, Stuttgart. He died at Dornach May 30 1925.

His chief works include: *Goethe, als Vater einer neuen Aesthetik* (1888), Eng. ed. in preparation; *Die Philosophie der Freiheit* (1894), Eng. trans. ed. H. Collinson, *The Philosophy of Freedom* (1916); *Friedrich Nietzsche* (1895); *Goethes Weltanschauung* (1897); *Theosophie* (1904), Eng. trans. by E. D. S., *Theosophy* (1910); *Haeckel, die Welträtsel und die Theosophie* (1905), Eng. trans. Haeckel, *The Riddles of the Universe; and Theosophy in Three Essays on Haeckel and Karma* (1914); *Wie erlangt man Erkenntnisse der höhern Welten* (1909); Eng. ed. trans. Clifford Bax, 2 vol., *The Way of Initiation and Initiation and its Results* (1909–10); *Die Aufgabe der Geisteswissenschaft und deren Bau in Dornach* (1916); Eng. ed. trans. A. M. Wilson, *The Mission of Spiritual Science and of its Building at Dornach, Switzerland* (1917); *Die Kernpunkte der Sozialen Frage* (1919); Eng. ed. *The Threefold State—The True Aspect of the Social Question* (1920); *In Ausführung der Dreigliederung des Sozialen Organismus* (1920), Eng. trans. in *The Threefold Commonwealth*, vol. I, No. 5, 6 (1921), complete Eng. ed. in preparation.

**BIBLIOGRAPHY.**—E. Boldt, *Von Luther bis Steiner* (1921); Eng. trans. (1923); F. Rittelmeyer, *Von Lebenswerk R. Steiners* (1921); G. Kaufmann, *Fruits of Anthroposophy an Introduction to the Work of Dr. R. Steiner* (1922).

**STEINMETZ, CHARLES PROTEUS** (1865–1923), American inventor, was born at Breslau, Germany, April 9 1865. He was

educated at Breslau, Zürich and Berlin, specialising in mathematics, electrical engineering and chemistry. Becoming an active socialist; he had to leave Germany and went to the United States in 1890, beginning work in Osterheid and Eickemeyer's factory, Yonkers, N.Y., where his knowledge brought him speedy promotion. In 1893 he became consulting engineer of the General Electric Co., Schenectady, and from 1902 was professor of electro-physics at Union University there. He served as president of the city council and of the board of education of Schenectady. He was one of the greatest scholars and scientists in the electrical field and on the mathematics related thereto, and his researches did much to further the progress of applied industrial chemistry. True to his socialistic view of life, he refused to accept remuneration for his services, other than his bare living expenses. He died at Schenectady, N.Y., Oct. 26 1923.

He was the author of *Theory and Calculation of Alternating-Current Phenomena* (1897); *Theory and Calculation of Transient Electric Phenomena and Oscillations* (1909); *Radiation, Light and Illumination* (1909); *Engineering Mathematics* (1910); *Electric Discharges, Waves and Impulses* (1911); *America and the New Epoch* (1916); *Theory and Calculation of Electric Circuits* (1917); *Theory and Calculation of Electrical Apparatus* (1917).

**STEVENS, JOHN F.** (1853– ), American civil engineer and railroad official, was born at West Gardiner, Me., April 25 1853. He was assistant engineer of the city of Minneapolis in 1874–6, afterwards engaging in railroad engineering with the Sabine Pass and North-Western, Denver and Rio Grande, Chicago, Milwaukee and St. Paul and Canadian Pacific Railway companies. In 1889 he became connected with the Great Northern Railroad, in 1895 becoming chief engineer, and in 1902 was made its general manager. In 1903 he was chief engineer with the Chicago, Rock Island and Pacific Railroad, and in 1904 became second vice-president. He was appointed chief engineer of the Panama Canal in 1905, at the time when its construction policy was being determined, and the success of the enterprise owed much to his ability. For a short time in 1907 he was chairman of the Isthmian Canal Commission. He became vice-president of the New York, New Haven and Hartford Railroad in 1907, and in 1909 was president of the Spokane, Portland and Seattle, the Oregon Trunk and Allied railroads. He was head of the American Railway Commission to Russia, 1917–8, and president of the Inter-Allied Technical Board supervising the Siberian railways, 1919–23.

**STEVENSON, ADLAI EWING** (1835–1914), American political leader (see 25.907), died at Chicago June 13 1914.

**STEWART, JULIUS L.** (1855–1919), American painter (see 25.914), died in Paris Jan. 4 1919.

**STEWART, WILLIAM DOWNIE** (1878– ), New Zealand politician and publicist, was born at Dunedin July 29 1878, his father being a member of the Legislative Council. He was educated at the Otago Boys' High School and Otago University, taking his degree in 1900. He travelled through China and Siberia during the Russo-Japanese War, and on his return practised law in Dunedin, at the same time entering politics as the unsuccessful candidate for Dunedin South in the election of 1906. He was elected a member of the council of Otago University and of the Dunedin city council, was mayor in 1913–4, and in the latter year was elected to Parliament as member for Dunedin West. A period of War service with the Otago Regiment in 1916–7 interrupted his political career, but he was re-elected in 1919 and in 1922 joined the Massey Ministry as Minister for Industries and Commerce. On the death of Mr. Massey he was regarded as a strong candidate for Premier, but his absence and ill-health were against him and Mr. Coates was chosen. Mr. Stewart, Minister for Customs and Emigration under Mr. Massey, became Minister for Finance, and later attorney-general. He is joint author (with Professor Le Rossignol) of *State Socialism in New Zealand*.

**STEYN, MARTINUS THEUNIS** (1857–1916), Dutch South African politician (see 25.915), retired in 1910 and died at his farm near Bloemfontein Nov. 28 1916.

**STIEGLITZ, ALFRED** (1864— ), American photographer, was born at Hoboken, N.J., Jan. 1 1864. He was educated at the College of the City of New York (1879–81), at the Berlin Polytechnic, Germany (1882–8), where he made a study of photochemistry and photography, and at the University of Berlin (1888–90), where he studied chemistry. In 1890, on his return to New York City, he engaged in photoengraving and colour printing. He became editor of *The American Amateur Photographer* in 1892. He founded *Camera Notes* in 1897, and was editor till 1903, in which year he became publisher and editor of *Camera Work*. In 1905 he founded and became director of "291," a public laboratory for research in aesthetics of life. He wrote *Picturesque Bits of New York and Other Stories* (1897), and contributed numerous articles on photographic and artistic subjects to magazines and technical journals.

**STINNES, HUGO** (1870–1924), German industrialist, was born in Mülheim Feb. 12 1870. Educated as a mining engineer, in 1890 he entered his grandfather's firm but two years later established a business of his own, with a capital of 50,000 marks. The business expanded steadily and came to include, besides dealing in coal, the ownership of coal mines, barges, river steamers and sea-going vessels. Stinnes organised an international business in coal, including the importation of coal from England. He built up a fleet of steamers trading in the North Sea, the Baltic, the Mediterranean and the Black Sea. He also established iron and steel factories. During the World War he commanded a large share of the industrial work required by the German authorities and rapidly increased his shipping interests. His connection with the Government led to his acquisition of political influence and in 1920 he entered the Reichstag as a member of the Deutsche Volkspartei, the new electioneering name of the former National Liberal party. About the same time he began to buy up newspapers, whose democratic opinions were quickly modified in accordance with his own. In 1921 he was reported to be contemplating the formation of a super-trust to control the whole of German industry. He died in Berlin April 10 1924. After his death the business, conducted by his son, rapidly shrank. In June 1925 a conference of bankers was called to investigate the financial affairs of the trust; and bit by bit the great organisation was liquidated and sold. In Oct. 1925 a new company was registered at Hamburg under the title of Hugo Stinnes Coal Trade and Shipping Co., Ltd., the Stinnes family retaining 40% of the shares.

**STOCK EXCHANGE** (see 25,930).—Two features of importance marked the history of the stock exchanges in the few years preceding the World War. One was the rise in the rate of interest that set in after the South African War, which caused a steady and persistent decline in the values of fixed interest-bearing securities. The other was the boom in rubber and oil shares due to the invention of the internal combustion engine.

The rubber boom began in 1909 and lasted for three years. The price of rubber rose to over 12s. per lb., and the wisdom of the old coffee and tea planters in the East Indies and Malay States in planting rubber introduced by seed from Brazil was amply confirmed. A large number of new companies were formed, many with shares of 2s. each, which became especially popular with small speculators and investors. Huge profits were made by the pioneer companies, and the shares of two of them, the Pataling and the Selangor, rose to premiums of more than 3,000%. The inevitable over-production of rubber brought about a reaction, and before the War came the price of rubber had fallen to a normal level, which, however, left the best producers with a comfortable margin of profit and the less efficient with a fierce struggle for existence. The oil boom followed shortly after the rubber boom, and, though the market was narrower than that for rubber shares, it persisted for a much longer period. The price of oil rose steadily, reaching its highest point shortly after the outbreak of war. This was due partly to the increased use of motor vehicles (*q.v.*) and the conversion of ships' engines from coal to oil, and partly to the fact that the refining and distribution of oil was in the hands chiefly of two or three organisations with world-wide connections and

associations. The oil boom lasted about 10 years, but it did not provide quite the same opportunities as rubber for the company promoter, although oil companies' dividends remained for years on a high level.

## I. EFFECTS OF THE WORLD WAR

For some time before the outbreak of the World War markets were depressed. Early in July 1914 rumours of war began to affect the Continental bourses. On July 13 the Vienna market was demoralised by fear of hostilities, and its alarm was promptly reflected on the Berlin Bourse, Germany being Austria-Hungary's chief lender, and holding government and municipal loans of the Habsburg Empire estimated at over £200,000,000. On Monday July 27, the day before the declaration of war by Austria, the panic in Vienna was such that the bourse was ordered to be closed for three days. As it proved it was closed indefinitely. The Brussels market followed the lead of Vienna, ceasing business on July 27, and the Paris coulisse, or outside unofficial market, suspended operations on the same day. On Wednesday July 29 all account dealings in Berlin were suspended, transactions being confined to cash bargains. The Amsterdam and St. Petersburg bourses were entirely closed that day, while on Thursday July 30 all markets suspended business except London, Berlin, Paris (official market) and New York.

*London.*—London was not seriously perturbed until July 24, when the terms of the Austrian ultimatum to Serbia became known. On Thursday July 30 the stock exchange, which for days had been inundated with selling orders from the Continent, owing to the continental bourses virtually ceasing to function, was opened for the last time in that memorable year. During the first two hours no attempt was made to do business, and the next morning (July 31) the committee for general purposes decided not to reopen the House until further notice, and it remained closed until Jan. 4 1915. Business, however, was not entirely suspended. A certain amount of dealing took place on a strictly cash basis, in spite of official discouragement, and on Sept. 14 the committee had to take notice of these transactions. They fixed minimum prices for trustee stocks, based on the quotations ruling on July 30, with the object of preventing disastrous depreciation, and when in Oct. the New York Stock Exchange made minimum prices for American shares, these values were adopted by the London Stock Exchange. The maintenance of the minimum prices was insisted upon by the banks, which were vitally interested as large holders of trustee investments, and also because they had undertaken to continue their loans against securities without asking for additional margin.

On Nov. 19 1914 the stock exchange committee passed a special set of rules to govern the arrangement of the uncompleted mid-Aug. account. Bulls of stock carried over on July 27 (the date of the previous settlement) were required to put up a 5% margin on high-class securities and 10% on others, and pay interest fortnightly, or, alternatively, pay a higher rate of interest in lieu of margin. The taker-in was obliged to continue to take in at July 27 prices until after the War, but in the event of prices of the carried-over stocks rising to the level of July 27 1914 they had either to be paid for and taken up by the buyer or sold for his account. About £90,000,000 had been borrowed against securities, and it was not until the moratorium, first declared on Aug. 4, came to an end on Nov. 4 1914 that it was possible to carry through the mid-Aug. settlement. The affairs of a small number of members were in this operation wound up under the liquidation rule, but the amount of stock carried over under the special regulations was smaller than had been expected. The arrangement for carrying over stocks and shares worked well, thanks largely to the Americans' demand for their own securities, and the open position on the London Stock Exchange, which in Aug. 1914 was about £90,000,000, was reduced by the end of 1915 to about £20,000,000.

On Dec. 23 1914 the stock exchange committee decided to reopen the House on Jan. 4 1915, special conditions being promulgated for the conduct of business. The minimum price

list was extended to include interbourse securities. Minimum prices were gradually abolished, however, as liquidation ceased and prices settled down to a new level of investment values. On July 3 1916 the last of the London minimum prices were removed. The special arrangements compelled all dealings to be made on a cash basis. Naturally, the elimination of speculation reduced the volume of business, which was further restricted by a rule prohibiting dealings in stock that had not been in physical possession in the United Kingdom since Sept. 1914, and by the temporary existence of minimum prices, which virtually stopped business in the securities affected. But as these rules were relaxed business increased. On the day of reopening the number of bargains was less than 1,000. Gradually it expanded, but the daily average in 1915 was nearer 2,000 than 3,000. Every bargain had to be recorded, an innovation that was left in force for some time after the War, and then unfortunately dropped.

The course of prices in 1915 and the subsequent war years was generally downward. The market for American securities, however, was strong and active, and in 1915 showed a substantial advance. Wartime prosperity in the United States caused a great demand for American securities held in Europe, and European holders were encouraged to sell by the appreciation of the dollar in terms of sterling and francs. In the second half of 1915 the British Govt. bought large quantities of American securities held in the United Kingdom, and sold them in order to provide itself with the means for making payments for munitions, etc. About £150,000,000 of American securities held by British investors were sold back to the United States in 1915. Towards the end of 1915 the Government ceased operations in the market, and invited holders either to sell or lend to it approved American and other foreign securities. The terms of purchase were approximately the parity of New York price, and for a loan a bonus of  $\frac{1}{2}\%$  per annum in addition to the interest or dividend was paid, plus a premium of  $2\frac{1}{2}\%$  in the event of the Government's deciding to exercise its right to sell the stock lent to it.

In 1917 there was a check to the depreciation of fixed interest-bearing securities which had gone on ever since the South African War, while, owing to inflation of the currency and the activity of business to which war orders and war expenditure had given rise, a strong upward movement in industrial securities occurred. The following table, compiled from figures published by *The Bankers' Magazine*, shows the course of investment values at different rates on the London stock exchange since the calculations were first made.

| Date                      | Market value of 387 representative securities |
|---------------------------|-----------------------------------------------|
| Jan. 1907                 | £3,843,000,000                                |
| July 20 1914 <sup>1</sup> | 3,371,000,000                                 |
| Nov. 1918 <sup>2</sup>    | 2,822,000,000                                 |
| Dec. 1919                 | 2,635,000,000                                 |
| Dec. 1920                 | 2,320,000,000                                 |

<sup>1</sup> Pre-War. <sup>2</sup> Month of Armistice.

These values relate to 387 representative securities down to Dec. 1920. The general depreciation was due to the exceptional inflation rendered necessary by the War, which reduced the value of money and therefore of those securities interest on which was fixed. Taking the values of 108 fixed interest-bearing securities, we find that the total market valuation on July 20 1914 was £1,980,000,000 and at the end of 1919, £1,378,906,000—a net depreciation of about 30%. The prosperity of industrial companies, especially those engaged in war work or in supplying foodstuffs, enabled them to pay high dividends, and in many cases to distribute bonus shares as well. The value of 279 speculative securities, *i.e.*, securities the dividends on which fluctuate according to profits, was £1,382,000,000 on July 20 1914, and at the end of 1919 £1,255,578,000, a net depreciation of 9% on the period.

*Paris.*—The Paris bourse was reopened on Dec. 7 1914, and thereafter there was a steady rise in prices. After 15 months

of war the first French war loan was raised. As a necessary preliminary the settlement of the end—July 1914, which had been suspended, was begun on Sept. 30 1915 and carried through without much difficulty. The Bank of France gave credit freely for the purpose, lending the parquet or official market about 150,000,000 and the coulisse or kerb market, 35,000,000 francs. Five % was charged from July 1914 to Sept. 1915 on all unsettled bargains, holders had to pay their differences in full or pay 10% of them, and 10% at each subsequent monthly settlement, until the 100% was wiped off. Six % interest was charged on unpaid differences. All new business was restricted to cash, account dealings being confined to clearing up accounts which existed before Aug. 1 1914. Little of interest occurred during the remainder of the war period, except that industrial shares were strong while Government securities were steady, dealings in the latter being subject to strict regulations.

*Berlin.*—For years before the War the Berlin bourse had frequent attacks of nervousness. Sept. 4 1911 was panicky owing to alarms in foreign politics. Early in 1912 the Government commissary of the bourse issued a public warning against excessive speculation. During the year rumours of war caused heavy selling from time to time, and on Oct. 1 the Balkan mobilisation caused a panic in which settlement stocks lost on an average 20 points in one day. Altogether, the total loss of market values in 1912 amounted to £150,000,000.

On the outbreak of war, the German Govt. imposed more stringent conditions upon the stock exchange than those imposed by any other government. The open market for stocks and shares was abolished, and the publication of prices was strictly forbidden. Cautious efforts, however, were made towards the end of 1915, and with some success, to liquidate bourse transactions which had remained in suspense. Much speculation took place in 1916, and this was given as a reason for continuing the veto on the publication of prices. But for purposes of taxation assessments lists of prices were issued at the end of that year for the first time since July 1914. These showed many big rises in industrial securities owing to the enormous profits made by German companies. All German war loans were, however, listed by special instruction at the price of issue. Prices continued to rise in 1917 until America entered the War, when a reaction occurred. At the end of 1917 lists of prices were again drawn up for taxation purposes, but publication of prices was still prohibited. Between Sept. and Dec. 1918 the quotations of German securities on the German markets fell so heavily that German financial writers estimated the decrease in capital value at about 50%. Then began the collapse of Germany's credit in foreign markets.

*Amsterdam.*—The Amsterdam stock exchange was not reopened until Feb. 9 1915. In that year foreign stocks were very weak, owing to persistent selling from Germany. The year 1916, however, witnessed a larger volume of business and remarkable fluctuation in prices. At the close of it many shares showed enormous gains. Home industrial concerns which made huge profits as the result of the elimination of German competition made the largest advances. The Dutch Indian plantation companies made very large profits, especially those producing sugar. Royal Dutch shares were introduced for the first time on the American market in 1916. Russian stocks fell precipitately in the last months of 1917 on the stoppage of interest payments and the Bolshevik Government's decree repudiating the national debt. This meant a serious disaster to Dutch investors, for they were reckoned to own between 1,500 million and 2,000 million florins of Russian Govt. municipal and railway bonds. In 1918 the tendency of the market was irregular and sometimes weak owing to the German collapse, but large new issues of capital were made by commercial and industrial concerns.

In Vienna and Budapest extravagant speculation sent prices up to extraordinary figures on the enormous paper profits made by practically all businesses. A heavy fall followed the military collapse of 1918. In Switzerland the Basel and Zurich bourses suspended operations towards the end of July 1914, but the

Geneva and Lausanne bourses remained open during August. On Jan. 7 1915 the Basel stock exchange resumed the publication of its daily price list, but it was not until June 26 1915 that transactions were extended to the full pre-War list. The Zurich bourse restarted official business on May 15 1916.

*New York.*—The New York Stock Exchange was called upon to stand the first shock of Austria's declaration of war on July 28, and on that day, for the first time that year, transactions exceeded 1,000,000 shares. The Toronto and Montreal markets were closed that day after being open for business for a short time. On July 30 violent breaks in prices occurred on the New York Stock Exchange and the next day the committee decided to follow the lead of London, and to close the Exchange. It tentatively reopened its doors again on Nov. 28 1914 for trading in bonds only. As the experience was encouraging, it was decided to reopen the House for regular trading on Dec. 13. Minimum prices had been fixed by the committee on Oct. 13, and trading in unlisted securities was resumed on the following day. The minimum prices were revised from time to time, and abolished on March 31 1915, a rise in quotations rendering minima no longer necessary.

Then followed the most remarkable era in the history of this exchange. The year 1915 established a fresh record for feverish activity and wild fluctuations. Million-share days, sensational advances and equally sensational declines, were common occurrences. Participation by the outside public had seldom, if ever, been witnessed on the same scale before. Under clique and pool manipulation prices were whirled upwards with amazing rapidity. Even more remarkable was 1916. Activity was intense, and prices rose to exceptional heights, the public buying with great confidence the shares of companies believed to be making big profits out of war orders. Every dollar security offered from Europe was eagerly purchased; it was estimated that the United States absorbed about 1,700 million dollars American railroad securities in payment for munitions. In 1917, the year of America's entry into the War, there was a heavy reaction, which particularly affected railroad shares and bonds, the former decreasing in value by 2,000 million dollars and the latter by 1,000 million dollars. This was attributed to a heavy increase in cost of railroad operation with no compensating advance in railroad charges. Heavy liquidation in the autumn of 1917 carried prices of the best investment stocks down to a level lower than that touched in the financial panic of 1907. Heavy taxation for war purposes frightened capital for a time, but in 1918 opinion had settled down to the exigencies of war finance and there was a recovery on the Stock Exchange.

## II. MARKET CONDITIONS AFTER THE WAR

*Revival of Speculative Business.*—The years 1919 and 1920 witnessed on the London Stock Exchange marked activity in speculative securities and a persistent neglect of fixed interest-bearing securities, especially Government stocks. In the summer of 1919 various wartime restrictions were removed from the London Stock Exchange, including the embargo on exports of capital, thus enabling foreign-held securities to be sold on the London market. Oil shares rose to extravagant heights, and Rand gold shares had a boom on the high premium in sterling which they received for their gold. Rand mines shares were introduced on the New York market towards the close of 1919, this being the first time that South African gold shares were listed in Wall street. Diamond companies enjoyed a wonderful period of prosperity. Record dividends were paid by all kinds of companies, and share quotations reached unprecedented figures.

*The Great Slump.*—In 1920 nomination for membership of the London Stock Exchange rose in price to £650, but by the end of the year it was almost unsalable. The first signs of war impoverishment appeared in the spring. The demand for goods and services suddenly failed; a crisis developed, starting in Japan, and the foreign exchanges showed a general collapse in terms of the American gold dollar. The fall in commodities forced traders to realise securities. The pressure for money and general nervousness depressed British Govt. stocks down to a level at which they

gave a return of over 6% per annum. The decline in stock exchange values as measured by 387 representative securities was the heaviest ever recorded in one year, the loss being £315,600,000. Commercial and industrial securities declined by 40.9%, British and Indian funds by 11.0% and Foreign Govt. bonds by 18.8%. Iron and steel shares fell by 33.7%; and South African mining shares by 39.2%. So severe were the losses that for the next two years investors avoided speculative shares, and bought mainly gilt-edged stocks, which had a rise of about 25% in 1921 and 1922. The issue of foreign Government loans in London, suspended on the outbreak of war, was resumed in 1921.

The trade slump in America in 1920 was heralded by a decline in the stock market. Stocks reached their peak in Nov. 1919, when they touched a figure only fractionally below the highest point of the war period—101.51, which marked the culmination of the famous war brides boom of 1916. Nov. 1920 was a month of devastation and almost of panic. *The Economist's* index number fell to 66. In 1921 the Wall street market made a recovery, but the tendency was very erratic. As in England, fixed interest-bearing stocks found favour. On the London Stock Exchange British Govt. securities rose 12%. A feature in this year was the collapse of Grand Trunk stocks on the decision of a majority of the arbitration court that for the purposes of the sale to the Canadian Govt. the preference and ordinary stocks were valueless. Mr. Taft, the dissenting arbitrator, held that they were worth at least \$48,000,000. But the Canadian Govt. accepted the award of the majority, with the result that Canadian credit among English investors was seriously prejudiced. Continental bourses had an irregular experience. The Swiss markets were depressed, and towards the end of the year showed signs of panic. Germany, on the other hand, had a buoyant market owing to inflation.

*Improving Conditions.*—The year 1922 witnessed a general recovery in prices on the London stock exchange, thanks partly to cheap money due to the depression in trade. Confidence in home railway stocks, which had fallen to a low level, revived on the amalgamation of the railways into four groups. A revolutionary strike on the Rand ended in a fashion that restored sound conditions for the gold-mining industry. On the Continent the outstanding events were a further rise in German mark securities, and a panic in Switzerland on a capital levy project, which, however, was defeated. In New York the stock market advanced about 40% by mid-Oct., when a Near East war cloud caused a sharp reaction.

The following year (1923) was a less buoyant period in London than 1922, movements on balance being small. By this time continuous inflation in France had depressed French Govt. credit down to a 7½% basis, but industrial securities were firm on active trade produced by monetary inflation. Prices of German industries reached fantastic figures in worthless marks. In Wall Street in 1923 there was much liquidation.

The year 1924 brought active and strong markets to the London Stock Exchange, and at times business reached the dimensions of a boom. A boom in tea shares was an outstanding event. In Paris the public held aloof from the bourse, and all forms of securities developed extreme weakness, this being due to the disturbance of public confidence caused by continuous budget deficits and depreciation of the franc. The abandonment of the old mark involved a complete revaluation of securities on the German bourses. After the elections in Nov. 1924, the New York Stock Exchange jumped into a veritable boom. In 18 trading days listed stocks alone showed a market appreciation equal to the whole amount of Britain's debt to the United States.

The course of values on the London Stock Exchange from Dec. 1921 to Dec. 1925 is shown in the subjoined table:—

| Date                | Market value of 387 representative securities<br>( <i>Bankers' Magazine</i> ) |
|---------------------|-------------------------------------------------------------------------------|
| Dec. 1921 . . . . . | £5,393,000,000                                                                |
| Dec. 1922 . . . . . | 6,105,000,000                                                                 |
| Dec. 1923 . . . . . | 6,257,000,000                                                                 |
| Dec. 1924 . . . . . | 6,518,000,000                                                                 |
| Dec. 1925 . . . . . | 6,465,000,000                                                                 |

These values relate as before to 387 securities, but include some of the big war loans. Since Dec. 1923 the figures relate to 365 securities, the amalgamation of the railways having resulted in a diminution in the number of securities.

On the London Stock Exchange 1925 was a good year, the outstanding feature being a boom in rubber shares on a rise in the price of the commodity. Share values on an average were doubled during the year. Fixed interest-bearing securities fell about 3½%, but commercial and industrial securities, which rose 9·4% in 1924, advanced a further 4·3% in 1925. Home railway stocks were heavily depressed by a falling-off in traffics. High yielding European reconstruction securities were strongly supported, and Brazilian securities got back into favour once more.

In New York there never was a year in which a bull movement lasted so long or rose so high. It really began on Oct. 29 1923, when the average price of 50 representative securities forming *The Annalist's* index number stood at 77·15, which was the lowest of that year. By Nov. 1925 the index number had risen to 136·63. The period of greatest activity and spectacular rises was after the Nov. elections of 1924. On the Continent the Paris bourse was much affected by the depreciation of the franc, the flight from which was continuous and growing all the time. French Govt. and all fixed interest-bearing stocks declined, but industrial securities rose on the large profits made in active trade at constantly rising prices. In Italy industrial securities had a boom for a short time and then declined heavily, for reasons which appeared to be connected with stringency of money. The Berlin bourse presented no feature of great interest (apart from the liquidation of the Stinnes trusts), owing to the scarcity of money.

(C. J. M.)

### III. THE NEW YORK STOCK EXCHANGE

*History.*—The New York Stock Exchange is international in scope in that it affords a market place for securities from all parts of the world. The stock exchanges in the smaller cities of the United States are more provincial in character, dealings being confined mainly to local securities. Springing from an association of stockbrokers started in 1792, which operated in the streets and from neighbouring coffee-houses, the New York Stock Exchange was organised in 1817. The board met in various places, including the old Merchants' Exchange at Wall and William streets, but did not take permanent form until 1842, when it was established in the new Merchants' Exchange, now head office of the National City Bank of New York. It was the country's largest local exchange, but did not become a national market until 1875, when the adoption of the telephone, telegraph and stock ticker and the development of New York as the nation's financial metropolis brought securities from all parts of the country. About the same date the merger with it of two rival organisations brought the new association's membership up to 1,060. In 1879 40 new memberships were created, and the total has since remained fixed at 1,100. The Exchange now occupies an imposing building of its own covering approximately 32,000 sq. ft. of ground space bordering on Broad, Wall and New streets.

For many years, the business on the exchange floor has been confined to bonds and stocks as well as "rights" to subscribe to the latter. In the autumn of 1925, issues "listed" on the New York Stock Exchange had a total market value of approximately \$64,500 million. More than \$35,000 million of this amount was represented in 1,158 bond issues and more than \$29,000 million in 1,000 stock issues. The bulk of these issues were bonds and stocks of American business enterprises; but, through the recent development of interest in foreign investments, the listings in Jan. 1926 included 112 foreign bond issues, whose market value considerably exceeds 2,000 million dollars. The daily turnover in shares has risen with the growth of the country in wealth and industry; on several occasions more than 3,000,000 shares have been sold on the New York Stock Exchange in a single day. Since this does not include sales of less than 100 shares the actual daily total has probably exceeded four million.

*Distinctive Features.*—The New York Stock Exchange differs from the exchange in London in not permitting on its floor trading

in puts, calls or other optional contracts. Members are not, as in London, divided into brokers and dealers, inasmuch as a stock exchange member can exercise either function, except where the same transaction is concerned.

Other distinctive features of the New York Exchange are as follows: (1) Applicants for listings must provide carefully engraved certificates designed to prevent forgeries, registry of transfers to avoid over-issuance, and sufficient preliminary distribution to avoid violent price fluctuations. The requirements also cause the applicant to publish essential facts regarding capital structure and balance sheet items, and to agree to make public future earning statements, dividend notices and like matters. (2) The comprehensive ticker system makes it possible to report all sales of stocks and bonds in multiples of 100 shares almost instantaneously throughout the United States. (3) Member firms, some of which maintain numerous branch offices, have elaborate private wire systems. (4) Contracts are settled the next full business day through the operation of the Stock Clearing Corporation, a subsidiary. (5) The business of the exchange is rigidly supervised by a governing committee of 40 members, and by sub-committees which take charge of such routine features as the arbitration of disputes, admissions to membership, requirements for listing new securities and the business conduct of members. (6) The exchange keeps in touch with the financial condition of member firms through a questionnaire system which is compulsory for all member firms which, as brokers, handle margin transactions for the public. (7) The governing committee of the exchange, as trustee for its members, holds all the stock of the exchange's several subsidiary corporations, among which, in addition to the Stock Clearing Corporation, are the New York Stock Exchange Building Co., which holds a title to and administers the Stock Exchange building, and the Quotation Co., which supervises the collection and distribution of price quotations made on the exchange floor.

The latest available list of stock exchanges in the United States, totalling 27, includes, in addition to the New York Stock Exchange, New York Curb Market, New York Consolidated Stock Exchange, Boston Stock Exchange, Boston Curb Market; and one each in Providence, Hartford, Philadelphia, Baltimore, Washington, D. C., Richmond, Pittsburgh, Wheeling, Cincinnati, Louisville, Columbus, Cleveland, Detroit, Indianapolis, Chicago, St. Louis, New Orleans, Colorado Springs, Salt Lake City, Spokane, Los Angeles and San Francisco. The stock exchanges of the smaller cities are organised and conducted on similar lines to the New York Stock Exchange.

(C. E. M.)

**STOCKHOLM** (see 25.934), the capital of Sweden and its industrial and intellectual centre, with a population of 420,812 in 1923, is the chief port for imports, though second to Göteborg in exports, and has a large number of industrial establishments. The 80,000 sq. metres of the free port were increased by 191,300 sq. metres in 1925, and additional warehouses built; the new dock, to be finished in 1926, will take the largest vessels calling at Stockholm. Now that ships can reach the Mälär side of the harbour by passing through the Södertälje canal, further harbour works are projected on Lake Mälär, and a quay is to be built to accommodate the vessels up to 3,500 tons using the Hammarby channel, completed in 1925. Over 50% of the tonnage using the port is Swedish.

The work of rebuilding the railway station was begun in 1924, the goods station being replaced by another to the north of the city, and its site used for extending the passenger station. The line to Göteborg was in process of electrification in the same year. A stadium in Swedish mediaeval style, which will seat 15,000, was opened for the Olympic Games in 1912. The new law courts were finished in 1915, and the huge municipal buildings, of brick with a tower at the southeast corner, in 1922. The Engelbrekt church, standing on a hill and approached by flights of steps, was finished in 1914, and the Riddarholm church, the burial place of the Swedish kings, has been restored and mediaeval paintings brought to light. A statue of Jenny Lind, the singer, was unveiled in 1924.

**STOCKPORT**, England (see 25.937).—The area of the borough has been increased by the inclusion of Heaton Moor, Heaton Chapel and Heaton Mersey in 1912, and Heaton Norris in 1913, and the boundary now touches that of Manchester at Levons-hulme. The population in 1921 was 123,309, and the area of the borough 7,063 acres. There are 214 ac. of parks and recreation grounds, including the Woodbank Memorial Park of 95 ac., added to Vernon Park in 1921, and the South Reddish recreation ground of 7 ac. (1922); the Great Moor recreation ground was being laid out in 1926. Waterworks opened at Kinder in 1912 include a huge reservoir covering 44 ac., and supply an area of 80 square miles. Sewage disposal works were in course of construction in 1926. New buildings include those for the grammar school at Mile End (1916); the central library in Wellington Road (1913); and St. Mark's church (1921). An art gallery was presented to Heywood in 1912, and the foundation stone of a War memorial hall laid in 1923.

**STOKE-ON-TRENT**, England (see 25.951).—The single borough which unites under this name the six "potteries" towns of Staffordshire had an area of 20,759 ac. and a population of 240,440 in 1921. Since 1918 three members have been returned to Parliament for the divisions of Stoke, Hanley and Burslem. The unions of Stoke, Wolstanton and Burslem were amalgamated in 1922 and there is one parish continuous with the borough. In 1925 Stoke was created a city, and the corporation consists of 28 aldermen and 84 councillors. The administrative services have been gradually centralised; the offices for police and education are at Hanley, but the remainder at Stoke. The town hall was enlarged in 1910-2, and the county court offices have been separated from it. A cenotaph was erected in 1920 opposite King's Hall, which is part of the town hall. A central school of science and technology was opened in 1914, and the foundation stone of a large extension was laid by King George V. in 1925, when he proclaimed the city status of the borough.

**STOLYPIN, PETER ARCADIEVICH** (1863-1911), Russian statesman, was born at Baden-Baden in 1863, the son of Adml. Stolypin by his wife, a princess of the house of Gorchakov. He was educated at the University of St. Petersburg, and in 1884 entered the Government service. In 1902 he was appointed Governor of Grodno, and in 1903 was transferred to Saratov, where he became known as a firm administrator. In 1906 he was recalled to take up the position of Minister of Internal Affairs, and in July of the same year succeeded Goremykin as Minister President (see RUSSIA). His firm and repressive policy toward all kinds of sedition caused him to be regarded as a deadly enemy by the revolutionary party, and many attempts upon his life were made. In Aug. 1906 a bomb was exploded at his summer residence, which seriously injured one of his daughters, but all efforts to kill him proved vain until 1911, when he was shot in a theatre at Kiev on Sept. 14, before the eyes of the Imperial family, by a Jew named Mordka Bogrov. The Minister died of his wounds Sept. 18 1911.

**STOMACH:** see ALIMENTARY SYSTEM.

**STONE, MARCUS** (1840-1921), British painter (see 25.957), died in London March 24 1921.

**STONE, MELVILLE ELIJAH** (1848- ), American journalist, was born at Hudson, Ill., Aug. 22 1848. In 1860 his father was made pastor of a Methodist church in Chicago, and it was there that he got his schooling. In 1864 he began work as a newspaper reporter, but he became proprietor in 1869 of an iron-foundry and machine shop. In the great Chicago fire of 1871 this was destroyed, and Stone then engaged in the administrative work of municipal relief and reconstruction. In 1872 he became one of the editors of the *Chicago Republican* (subsequently *Inter-Ocean*), and later of the *Post and Mail*, becoming for several years a political correspondent at Washington.

At the end of 1875, having returned to Chicago, Stone, with a colleague, started the evening *Daily News* (see 19.571), and two years later Victor F. Lawson became a partner. The venture was very prosperous. He and Lawson bought out the *Post and Mail*, and in 1881 they established the *Morning News* (later *Record and Record-Herald*). In 1888 he retired, taking a prolonged holi-

day in Europe. Returning to Chicago in 1891, he and others founded the Globe National Bank, of which he became president. In 1893 he accepted the position of general manager of the Associated Press. At that time the Associated Press was still struggling (see 19.547) with its competitor, the United Press, but its enterprise now received a new stimulus, and by 1897, under Stone's management, and as subsequently reorganised in 1901, its service knew no rival. He held this position until April 1921, when he retired. During that period of 28 years the budget of the Associated Press had grown from \$500,000 to \$6,000,000, and it had come to furnish more than half the news printed in American papers. See his autobiography, *Fifty Years a Journalist* (1921).

**STORY, JULIAN** (1857-1919), American artist (see 25.970), died at Philadelphia, Pa., Feb. 24 1919.

**STRACHEY, GILES LYTTON** (1880- ), British writer, son of Sir Richard Strachey, the Indian Administrator, was born March 1 1880, and educated at Trinity College, Cambridge. He was an occasional contributor to the monthly and quarterly reviews, and published a short but illuminating book on *Landmarks in French Literature* (1912). He achieved wider renown by *Eminent Victorians* (1918), vivid, polished and unusually caustic portraits of Cardinal Manning, Florence Nightingale, Dr. Arnold and General Gordon. In *Queen Victoria* (1921) Strachey's biographical power and his ironic style showed themselves broadened and mellowed, the result being a most successful blend of sympathy and detachment in depicting the Queen, her family and her epoch. The two books set up a fresh standard for modern English biography which a good many contemporary writers were quick to acknowledge. A collection of essays, *Books and Characters*, appeared in 1922, and his "Leslie Stephen" lecture on Pope in 1925.

**STRACHEY, JOHN ST. LOE** (1860- ), British journalist, was born at Sutton Court, Somerset, Feb. 9 1860, the second son of Sir Edward Strachey, 3rd Bart., and Mary Isabella, daughter of John Addington Symonds. He was educated at Balliol College, Oxford, graduating with a first class in modern history, and was subsequently called to the bar; but he adopted journalism as his profession. In 1886 he became assistant editor of *The Spectator*, and after the death of R. H. Hutton and the retirement of Meredith Townsend (1897) he became proprietor of the paper, which under his editorship not only maintained but increased the high reputation it had gained (see 19.562) for sober political criticism and well-informed appreciation of art and literature, so that he exercised great influence upon English opinion. St. Loe Strachey also edited (1896-7) *The Cornhill Magazine*. He was specially interested in problems of rural housing, pauperism and local government generally. In 1925 he relinquished his editorship of *The Spectator*, but did not cease to contribute to its columns. See ENGLISH-SPEAKING PEOPLES, RELATIONS OF THE.

Amongst his publications are: *The Manufacture of Paupers* (1907); *The Problems and Perils of Socialism* (1908); *The Practical Wisdom of the Bible* (1908); *A New Way of Life* (1909).

**STRAITS SETTLEMENTS** (see 25.980).—The population according to the census of 1921 was as follows: Singapore (with Labuan, Christmas Island and the Cocos-Keeling Islands), 425,912; Penang, Province Wellesley and the Dindings, 304,335; Malacca, 153,552; total, 883,769. The population was estimated at 950,952 in 1924. Both birth-rate and death-rate were highest among the Malays. The total death-rate, 27.42 per 1,000 in 1924, was the lowest recorded; the death-rate per 1,000 among Europeans was 7.82. Malaria remains a prolific, though diminishing, cause of death; as for beri-beri, the deaths were reduced from 2,056 (with a total population of 705,405) in 1911, to 1,299 in 1921, and 910 in 1924, owing probably, in part, to a better understanding of dietary requirements. Chinese immigrants reached maximum numbers in 1911 (269,854); in 1924 there were 181,430, and they exceed emigrants by 87,749. About 70% were men. An increase of immigration in recent years is due partly to improvement in commerce, especially the tin trade, but partly also to the disturbed conditions in southern China; the number of Chinese women and children arriving in 1924 was the highest recorded, and their coming commonly implies intention to settle

permanently. Immigrant Indians arrived at Penang to an average yearly number of 54,000 in 1921-4; the numbers, again, fluctuated with the conditions of trade (see MALAY STATES, FEDERATED).

In many respects the colony actually benefited from the World War; there was, for instance, an increase in the gross value of trade from £63,600,000 in 1914 to £148,200,000 in 1917. The Chinese community was on the whole prosperous, and while the increased cost of living and the high rate of exchange with China bore hardly upon the poorer classes, the increase of wages in great measure counterbalanced these disadvantages. The Chinese freely supported patriotic and charitable funds, and after some demur, before its purpose was fully understood, recognised without further difficulty the War tax ordinance of 1917. The War, however, produced its problems for the community. It was necessary to establish a censorship of Chinese newspapers, and in June 1919 an anti-Japanese boycott resulted in rioting in Singapore and Penang, while a Chinese patriotic league and an anarchical body, the so-called Truth Society, gave some trouble. Preventive action, however, was taken by the Chinese protectorate and the police, and by 1925 the activities of secret societies generally had been markedly curbed.

*Tin and Rubber.*—The export trade of the colony depends primarily upon tin and rubber. The British Malay territories produce nearly half the world's yield of tin ore (the Federated Malay States yielding the bulk), and more than half the smelted tin. Smelting is carried on mainly at Pulau Brani, near Singapore, and at Butterworth (Penang), ore being imported not only from the Federated Malay States but also from the Dutch islands (Banka, etc.). Tin was more early developed than rubber, mainly, in the first instance, by Chinese enterprise. The production of rubber was not large before 1909-10, when world production received powerful stimulus.

The reaction from prosperity which began to affect world commerce after 1920 struck hard upon the tin and rubber trades of the colony (including that of the Federated Malay States). The assistance of the Government was necessary for both. Tin was purchased by the Government at agreed prices, and the stock for which there was no immediate market was brought into the so-called Bandoeng pool, formed in co-operation with the Govt. of Netherlands India on behalf of the mining industry of Banka and other Dutch islands; the stock thus retained was disposed of by 1924-5 as prices revived. The output of rubber was restricted by legislation in concert with the Govt. of Ceylon, on the basis of the Stevenson scheme, stock being released as justified by current prices. These arrangements aided the return of prosperity to the colony; moreover, in the case of the rubber industry occasion was afforded to rest the plantations, and in particular to restrict the tapping of young trees.

*Problem of Food Production.*—The principal economic problem with which the colony has had to cope was not connected with the War. The remarkable extension of rubber planting about 1909-10 led to the neglect of fruit cultivation and other forms of native agriculture, and this tendency persisted. The people ceased in great measure to cultivate their own food crops and raise their own live stock, and became dependent on imported foodstuffs. In 1917 rice was imported from Rangoon, Siam and French Indo-China; wheat flour from Australia and India; cold storage foodstuffs from Australia and other foodstuffs from China. Difficulties connected with shortage of supplies and shipping made it necessary to set up food control in 1917. An inquiry was instituted into measures for increasing home produce of rice and other foods, and "cultivation clauses" were inserted into leases of newly alienated lands. In 1918 the United States restricted imports of rubber, with a consequent reaction upon the Straits Settlements industry. This could not, however, immediately affect food cultivation, and in that year shortage in India, floods in Siam, and the demand for imported rice in Java and Japan caused serious conditions in the Straits Settlements. Siam prohibited export of rice in July 1919: the Straits Settlements controller took entire charge of import and wholesale dealing and a food production department was established

which fostered home planting, and in spite of many difficulties it was found possible, early in 1920, to ensure supplies for several months. The Governments of the Straits Settlements, Netherlands, India and Ceylon agreed in 1919 to purchase through a single agent to avoid competition.

*Trade and Finance.*—Traders generally have been encouraged to develop a wider range of products. Exports of rice, fish, areca nuts, sago, copra, pepper and preserved pineapples showed an increase in 1924 over those of 1923. In 1925 the fisheries department was undertaking research, with a shore institution and a ship, into the possibilities of extending the fish trade, canning such products as anchovies, etc.

The value of exports, which fell to £56,138,000 in 1921, rose to £89,430,000 in 1924; and that of imports from £65,791,000 to £98,915,000 in the same years respectively. The figures for 1921 were little more than half those for 1920; but they are not strictly comparable, because a new system was introduced in 1921 whereby each territory of British Malaya (including the Federated Malay States) makes returns which are consolidated for the whole, whereas previously there was some measure of duplication.

The revenue of the colony amounted to £28,639,161, and the expenditure to £26,706,316 in 1924. The value of the dollar is fixed at 2s. 4d. The cost of living for Europeans is high, for there is a tendency for the dollar more nearly to equal the shilling in purchasing power.

*Education.*—The centenary of the modern foundation of Singapore by Sir Stamford Raffles was the occasion for local celebrations in Feb. 1919, and by way of commemoration it was decided to found a Raffles College for higher education. Evidence of the general enthusiasm for this scheme was given by the prompt provision of subscriptions which ensured its success and enabled plans to be laid forthwith. The Straits Settlements Govt. promised a donation of \$1,000,000; the same Government and those of Johore and Kelantan guaranteed annuities in perpetuity amounting to \$63,000, and by the Governments of the Federated Malay States and Kedah, and from various private sources, annuities for a term of years, amounting to \$655,000, were promised. Designs for the new buildings were adopted in 1924, and the erection of science and administrative blocks, a hostel and staff quarters was authorised. There have been other signs of a demand for a more active education policy, this being especially desirable as a counter-measure against undesirable propaganda. The Rockefeller Foundation in 1924 granted an endowment of \$350,000 for chairs of bacteriology and biochemistry in King Edward VII. College of Medicine at Singapore, the Government undertaking to bring the provision for these chairs up to the level of others in the college.

**STRANG, WILLIAM** (1859-1921), British painter and etcher (see 25.982), died at Bournemouth April 12 1921, having been elected an R.A. a month before that date (see *Catalogue of William Strang's Etched Work, 1882-1912* (1912)).

**STRASBOURG** (see 25.984) was acquired by France under the treaty of Versailles, and is now the chief town of the department of Bas-Rhin and the principal eastern port of France. The population was 166,767 in 1921. A commission was appointed to bridge over the administrative and legislative difficulties of the transference from Germany to France. The Hôtel des Deux Ponts, in the same street, was the German headquarters during the World War. Kehl, a town with a population of 8,800, on the German bank of the Rhine, was constituted one with the port of Strasbourg for purposes of exploitation for a period of seven years from 1919. Extensive improvement schemes were approved in 1924, including the creation of a large port above Strasbourg, connecting with the older harbour by canal, and a petroleum harbour below the town. Work was begun on the

more important parts of the scheme at once; the port entrance has been altered, and several new quays have been built. No development has taken place in connection with the proposal to build a canal to link up Strasbourg and Basle. The university was reopened as a French institution in 1922.

**STRATEGY** (see 25.986c).—Whilst peace is largely an economic and political struggle between men whose purpose is to gain physical and individual security, war is largely a physical struggle between nations in which the acquisition or maintenance of economic and political security is the aim. In peace man uses his physical force to conquer Nature; in war he uses it to conquer his own kind. In the one case the conflict is mainly a material one, in the other it is largely ethical, as it is directed against opinion sustained by force and not against matter merely endowed with energy.

*Relationship of Peace and War.*—In peace the ethical rights of nations are maintained by force actual or potential according to the political system in vogue; for even in the most democratic nations the power of the majority expressed in the legislative, police and military forces of the nation is the foundation and guardian of the national will. In peace as in war the final arbiter of law and order is military force. The means differ in degree though the end is the same. The end is the maintenance of internal existence, in the one case through prevention of internal disruption, and in the other through the prevention of external pressure. It is for this reason that William James, when discussing "The Moral Equivalent of War," was of opinion that: "Every up-to-date dictionary should say that 'peace' and 'war' mean the same thing, now *in posse*, now *in actu*. It may even reasonably be said that the intensely sharp competitive preparation for war by the nation is the real war, permanent, unceasing; and that battles are only a sort of public verification of mastery gained during the 'peace' intervals." And Clausewitz—"that war is nothing but a continuation of political intercourse, with a mixture of other means." And again: "We see, therefore, that war is not merely a political act, but also a real political instrument, a continuation of political commerce, a carrying out of the same by other means . . . for the political view is the object, war is the means, and the means must always include the object in our conception. . . . State policy is the womb in which war is developed, in which its outlines lie hidden in a rudimentary state, like the qualities of living creatures in their germs."

If in peace force is essential to the maintenance of tranquillity, prosperity and the security of the social order: in war (the causes of which may always be traced to some discontent in the existing state of peacefulness), the true political object is to create a better condition of peace than that which existed before its outbreak. This condition is in nature three-fold—in order that the war may have proved itself economical, then must the peace which follows it be more contented, prosperous and secure than the one the war destroyed. In great civilised nations this destruction of the conditions of peacefulness—rather than of the material power of the enemy or of the enemy himself, is accomplished by military pressure and resistance as exerted by the instrument of war, which may be an army, a navy or an air force, or all three combined.

To animate this instrument the will of the majority of the nation must support the war; for in democratic countries it is this will, as expressed by the government, which makes war, accepts defeat or insists on victory. Further, to maintain the fighting forces which express the national will through physical action, the economic strength of the nation must be sufficient to provide them with all material needs, and never more so than to-day when the rapid mechanicalisation of the means of waging war is bringing all three services into intimate relationship with civil industry, and through civil industry with each other. The co-ordination of all these means—the will, economic strength and fighting force of the nation—toward the attainment of the political object of the war may be termed grand strategy, or the major movements and higher leadership which control, direct and influence the war.

*Grand Strategists of History.*—There is nothing novel in this conception, for as a foundation of military action the co-ordination of political direction and military control are as old as organised warfare itself. But whilst during the earlier history of war co-ordination was less complex since armies were more independent and self-supporting, in modern wars its importance has become more and more manifest until its establishment on a scientific footing may be considered one of the most important of military problems. For co-ordination to exist, united control of all the forces expended in war as well as liberty of action in their expenditure are essentials. In democratic nations the first should be the prerogative of government, and the second of military command.

In the World War of 1914-8 a lack of strategical direction, especially on the side of the Allied Powers, was manifested on its outbreak, and was never overcome; for though towards the end of the War Marshal Foch was appointed generalissimo of the land forces of the Allies, no true political unity of control was created or could have been created in the circumstances. Failing the establishment of a despotism, which is almost unthinkable among allied democratic powers, this weakness in political control must always constitute the Achilles heel of nations temporarily confederated to resist the military pressure of a common enemy. In this War we find the Allied grand strategy far more rudimentary than that of Alexander the Great. He, as tyrant of the Grecian States, combined in his own person complete political control and unity of command. The grand strategy which he developed stands as a model for all times.

He saw that the states and cities of Greece could only be controlled by outward pressure, and that this pressure could only be gained through the conquest of the Persian Empire. His method was logical and scientific. First, he established tranquillity at home, without which his overseas expedition would have had no secure base from which to operate. Secondly, he gained command of the sea, and through this command control of the economic resources of Egypt, which were vital to the prosperity of Greece. Thirdly, he gained command of the land, and by ascending the throne of the Great King was able to control not only the military resources of Persia but also its immense wealth. Lastly, he attempted to bound his vast empire by unattackable frontiers so that it would be secured against invasion. His crucial idea was the establishment of a more contented, prosperous and secure peace. In the World War of 1914-8 we see no such grand strategy, because unity of political control was non-existent, and failing this unity true liberty of military action was impossible.

Throughout the entire history of war the most successful of the great captains, such men as Alexander, Caesar, Gustavus, Frederick and Napoleon, have been despots or autocrats, not because despotism and autocracy are in themselves military virtues, but because they permit of the closest political control of the strategy of a war. To-day the difficulties incumbent in grand strategical control are increasing, for whilst in the past military power mainly depended on man-power, which enabled all armies to establish a similar organisation and tactics, industry and industrial wealth are replacing population as the foundation of military strength. This amongst allied powers will frequently mean a divergence in military organisation, a variation of tactics, and consequently an increasing difficulty in control and combined action.

*Problems of Grand Strategy.*—Though there can be no doubt that the establishment of a more contented, prosperous and secure state of peacefulness is the true grand strategical object of a war, it by no means follows that this has generally been accepted; in fact few wars have led to so desirable a conclusion. The reason for this is twofold. First, no nation has hitherto possessed the grand strategical machinery necessary to co-ordinate political thought and military action, consequently warfare has assumed an almost entirely military aspect. Secondly, the causes of war have never been scientifically analysed, and have been obscured and hidden beneath the political pretexts and excuses justifying its outbreak.

As these justifications are seldom rational or true, a great war has normally been declared when through political obscurantism the mind of a nation is in an irrational mood. The nation is stirred up to fury, and the soldier, stimulated by this national emotion accentuated by the dangers which surround him, seeks a solution to the war in a victory of destruction. He attempts to impose on his enemy not so much his will as his physical force, and the result in the World War of 1914-8 was that the victors suffered but little less than the vanquished. This system of "Absolute Warfare," much lauded by Clausewitz, and founded on the ideal of absolute government, has toned the whole course of warfare since his day. The solitary exception was the campaign of 1866, in which Moltke's object was not to destroy Austria, but to gain her over as an eventual ally. As long as this barbarous system of grand strategy endures great wars will be concluded by vindictive peace treaties out of which further great wars will evolve. No modification or reduction of armaments can ameliorate this system, for its betterment must be sought in a change in the political brain—in the theory of war, and not in its tools.

Granted a political organisation which can co-ordinate, control and direct the forces of war, the next problem in grand strategy is the co-ordination, control and direction of the means. Hitherto military means have been mainly considered, but during the World War it became apparent that economic and ethical action played as important a part. To compel an enemy to accept defeat his national will must be broken. The traditional method has been to destroy the enemy's armed forces—the shield which protects this will. Though during the World War this method was universally adopted, as the War proceeded, the economic attack by blockade, bunker control and unrestricted submarine warfare, and the ethical attack by insidious propaganda became formidable instruments in undermining the national morale of the belligerents. In the case of Germany and her allies these means led to their defeat as much as did military pressure, because they directly attacked the national will to win.

The co-ordination, control and direction of the fighting forces themselves is the next problem, and here grand strategy merges into grand tactics, and policy into plan. In the case of Great Britain there was no grand tactical control during the World War, because no organisation existed which could co-ordinate naval and military force or action. The result of this was that directly power of movement ceased on the Western Front, command of the sea at once suggested, as it had done during the Napoleonic wars, a change of the theatre without reference to the grand tactical objective, which remained the defeat of Germany. This lack of grand tactical co-ordination undoubtedly prolonged the War for many months.

Once given a political organ which can formulate policy, and a military brain which can produce a co-ordinated plan in which the fighting forces are considered as one force, the next problem is the execution of the plan. This demands expenditure of force, and here grand strategy and grand tactics merge into strategy and tactics as these are generally understood.

*Expenditure of Military Force.*—Expenditure of military force is an art, and like all other arts it is based on science. The science of war is the science of human conflict in all its forms, whether the battle is a fight between two men or two or more nations. Without this science warfare must largely remain in an alchemical state, and be governed by chance and not by law. If force has to be expended in war, then the side which can best economise its force is the side which is more likely to win. Economy of force is, therefore, the governing law of war. Granted this law the next question is to decide on the nature of force; and as an army is but a number of men, the forces of war are to be sought in man himself. Human force is threefold in nature, it is mental, moral and physical, and no one of these forces can be expended without influencing the remaining two. Economy in the expenditure of these constitutes the central problem of strategy and tactics.

The expenditure of force presupposes pressure and resistance, and these two govern the direction force eventually takes. In

war each side must have an object which provisionally fixes the direction of military operations. To maintain this direction pressure and resistance must be exerted. These two factors if correctly employed lead to an economical distribution of force from which concentration of force may be developed. Thus are obtained three principles of war, namely, the principles of the direction, distribution and concentration of force, and these should control the formulation of all plans of war. These three principles are, consequently, closely related to the mental sphere of force—to the thoughts in the head of the general-in-chief out of which he evolves his plan. Before this plan can be transformed into physical action, that is executed by the men themselves, the troops must not only be willing but determined to carry it out. To do so their morale must balance their fear, consequently their determination to act must be supported by moral endurance. Further, to economise this endurance, they should aim at surprising the enemy, that is demoralising him.

In the moral sphere of war we thus obtain three principles closely related to the former ones. They may be called the principles of the determination, endurance and demoralisation of force. It is in this moral sphere that the decisive battle is waged. To attack the enemy's determination to win, physical action must be brought into play. Men must move, and movement depends on how far offensive action can be protected. Thus are obtained three physical principles of war, namely, those of mobility, security and the disorganisation of force (offensive action). Nine principles of war, therefore, govern the expenditure of force. Three are related to pressure, three to resistance and three to the control of their resultant—the direction of the operation, the determination of all ranks to attain the object in view, and movement towards the objective itself.

These nine principles, which are expressions of the law of economy of force, form the foundations of the science of war, without which the art of war is solely determined by individual predilection or chance. This science is expressed as an art through the instrument of war, the military organisation at the command of the general-in-chief, who, to act rightly, expends its force by applying the principles of war according to the ever-changing conditions which surround him. These conditions can either assist or resist him, and by a correct, that is, an economical application of principles to conditions, he abstracts the highest assistance from all the forces which surround his army. For him to do so with true economy it is necessary that the organisation of his army should be suitable to the nature of the operation in hand. This suitability consists in power to develop protected offensive action in the shortest possible time and at the highest possible speed.

From these considerations we see that not only are strategy and tactics complementary halves of the art of war, but that the geometric strategical ideas so favoured in former days, such as interior and exterior lines, lines of operation, concentric and eccentric attacks, etc. etc., are but details of the art of war, which should be as "fluid" as any other art, and is so when it is based on a full understanding of the science of war instead of on a personal improvisation. All that is necessary to prove the close inter-dependence of strategy and tactics is to turn to the history of war and examine its course.

*History of Tactics.*—The tactics of the Roman legion were based on the strategical mobility which their magnificent roads allowed. This mobility could only be maintained as long as troops were concentrated in large bodies. Once defensive tactics led to an over-distribution of force, through the establishment of a cordon system along the frontiers, the Gothic horse rapidly overruns the Empire, and after the battle of Adrianople (378) an infantry decline sets in. Thence onwards, except in mountainous and swampy countries, infantry degenerate into camp followers. As the Roman roads fall into disrepair the use of cavalry becomes general; further, all nomadic warriors are horsemen.

*Influence of the Horse.*—The influence of the horse on tactics is profound, and through tactical change strategy and organisation are modified, and the first post-classical cycle of war is

entered. The superior carrying power of the horse at once suggests the general use of armour from which to develop the offensive power of the soldier. The armoured horseman changes the whole organisation of war. Armies grow smaller since armour is expensive; casualties amongst armoured horsemen grow less and less, and the strength of a nation depends more on its ability to produce armour than on its man-power. Two defects are, however, never overcome, the first is the armouring of the horse, the second the difficulty of an armoured man using missile weapons when mounted. Strategy, save as stratagems, disappears; the tactical shock becoming the sole purpose of battle. This condition of war lasts for 1,000 years, when the long bow and pike attack the unarmoured parts of the horse, and gunpowder attacks armour itself. The result is the reappearance of infantry. By the date of the battle of Agincourt (1415) the mobility of the armoured horseman is reduced to zero.

The second tactical cycle is now entered. Protection by armour is by degrees replaced by protection through fire power, from which the shock of the pike-men is developed. As the musket, and later on the bayonet, are comparatively cheap weapons, armies grow in size, numbers of men rather than skill become the aim of the military organiser; roads grow in importance to maintain these masses, and casualties increase as fire power is developed; ultimately we enter the period of absolute warfare. The introduction of railways and steam power generally is followed by an enormous increase in the size of armies and in the perfection of weapons and equipment. Hordes of men are poured on to the battlefield, their control is difficult, their supply even more so, and, as fire power increases, the protective power of firearms is supplemented by the trench, and strategy vanishes through a general inability to move. By the year 1915 the zero point of movement through rifle and gun power is reached.

As the second cycle was introduced by the discovery of gunpowder, the third is introduced by the discovery of petrol. The first tactical cycle, based on armour, was protective in nature; the second, based on gunpowder, was offensive; and the third which has now begun is based on petrol, and its predominant quality will be mobility. In the World War the transition became apparent when a solution to static warfare was sought in prolonged artillery bombardments. The railways could amass thousands of tons of shells at the railheads, but from these points forward hundreds of lorries had to be used to move them. The shell failed to solve the problem of mobility, since in destroying the enemy's defences it simultaneously destroyed the surface of the ground, rendering it unfit for wheeled traffic. Eventually the tank solves the problem, as it can dispense with roads and move across country. This power, the ability of developing offensive action from protected cross-country movement coupled with the power of aircraft to attack an army in rear without engaging its front definitely ushers in the third tactical cycle which must profoundly influence strategy.

*The Passing of Linear Warfare.*—From the days of the Romans to present times the network upon which strategy was woven has been the road systems existing at any specific date. Armies advanced and retired along roads, their power of manoeuvre being largely limited by their number and condition. From road columns they deployed into battle lines, and in classical times line met line in a hand to hand struggle. After the introduction of firearms, a space, or no-man's-land, was developed between the contending forces, possessing in the days of Frederick the Great a depth of some 50 paces. This space profoundly influenced tactics, for the side which could make the better fighting use of it generally won.

To take advantage of this area weapons were improved, and accuracy, range and volume of fire increased, until in the World War its depth extended over 1,000 paces. Gas as a weapon was then introduced to obliterate whatever human resistance existed in or on the other side of this space, and eventually tanks were built to cross it and pass through the hostile battle-front and attack the enemy's rear organisation and services. Aircraft could do likewise by passing over in place of, through or round the enemy's line. The line had, in fact, reached its zenith, and

was no longer an economical formation, since it could not guarantee the protection of the area in rear of it. The influence of these tactical changes must pronouncedly modify strategy, as linear warfare will be replaced by area warfare, the strategy of which being to a large extent independent of roads and railways will become two and three dimensional.

These changes in the art of war face all civilised armies to-day, and it is for this reason that a science of war is necessary, so that the past history of war may be methodically analysed, and future tactical, administrative and strategical tendencies predicted. Without such a science, supported by sound political control, strategy must remain, as it has in the past, either the perquisite of genius or the plaything of chance. See WAR. (J.F.C.F.)

**STRATFORD-ON-AVON**, England (see 25.998), had a population of 9,392 in 1921 and an area of 4,013 acres. A summer season of the Shakespeare festivals, which have been under the control of Mr. Bridges Adams since Sir Frank Benson's resignation in 1919, has been held since 1910. Nash's house was adapted for public use in 1912. In March 1926 the Shakespeare Memorial Theatre was destroyed by fire; but the library and museum, in adjacent buildings, were saved. A water supply scheme, by gravitation from a reservoir at Snitterfield, was completed in 1923.

**STRATHCONA AND MOUNT ROYAL, DONALD ALEXANDER SMITH**, 1ST BARON (1820–1914), Canadian statesman (see 25.1000), died in London Jan. 21 1914. His barony passed by special remainder to his daughter Margaret Charlotte, wife of Robert Jared Bliss Howard of Montreal (d. 1921).

**STRAUSS, RICHARD** (1864– ), German composer (see 25.1003). His opera, *Ariadne auf Naxos* (1912), was produced at His Majesty's Theatre, London, by Thomas Beecham in May 1913 and the same year *Der Rosenkavalier*, first produced at Dresden in 1910, was performed at Covent Garden with great success, eight performances being given; in point of fact, this proved to be Strauss's most popular opera. His other works include *Festliches Præludium*, for orchestra (1913), and *Josephs Legende* (1914). In addition to the works enumerated, mention should be made of *Eine Alpensinfonie*, (1915, op. 64); and the three-act opera, *Die Frau ohne Schatten*, libretto by Hugo von Hofmannsthal (1916, op. 65). In the winter of 1920–1 Strauss visited South America, where he officiated at Buenos Aires as opera conductor, subsequently returning to Vienna.

**STRAVINSKY, IGOR FEDOROVICH** (1882– ), Russian composer, was born at Oranienbaum, near Leningrad, on June 5 (old style) 1882. He began to study composition privately under Rimsky-Korsakov in 1902 and four years later produced his first work, a symphony. This was followed in 1908 by a *Fantastic Scherzo*, the *Dirge in Memory of Rimsky-Korsakov* and the orchestral tone-picture, *Fireworks*. Much of his subsequent music was composed for Serge Diaghilev's Russian ballet, and includes *The Fire Bird* (1910), *Petroushka* (1912), and *The Rite of Spring* (1913). Stravinsky's music aroused a great deal of controversy, chiefly owing to a peculiar originality of structure which impressed his audience by the sense of surprising novelty which it conveyed. Among his later works are *Renard* (1915), *L'Histoire du Soldat* (1917), the symphony for wind instruments to the memory of Claude Debussy (1920), *Mavra* (1921) and *Les Noces Villageoises* (1923).

**STREET:** see ROAD CONSTRUCTION.

**STREET TRAFFIC:** see TRAFFIC PROBLEMS.

**STRESEMANN, GUSTAV** (1878– ), German statesman, was born in Berlin May 10 1878 and studied political economy in Berlin and Leipzig. After completing his studies he went on to the management of an industrial association, and in 1903 became secretary to the *Bezirksvereins des Bundes der Industriellen* (District Association of the League of Industrials) in Dresden. He soon succeeded in organising the *Sächsischen Landesverband des Bundes der Industriellen* (Saxon Provincial Union of the League of Industrials) out of the different district organisations. Thanks to his far-reaching organising activity Stresemann secured a prominent position for these associations in the economic and political life of Saxony. The Union in 1925

numbered about 7,000 industrial undertakings with some 600,000 workmen.

Stresemann's excellent organising successes brought him more and more influence in the headquarters of the Union of Industrials in Berlin. Provincial unions were founded on the Saxon model in Württemberg, Silesia and Thuringia, Stresemann playing a prominent part. In the further course of his activity in the field of political economy, he was founder and first president of the German-Canadian and the German-Austrian-Hungarian Economic Association (Wirtschaftsverband) and vice-president of the German-Bulgarian League in Berlin. He was also prominent in the organisation of the German Fleet League (*Flottenverein*).

In 1913 Stresemann and Ballin, the general manager of the Hamburg-America line, founded the German-American Economic Association, which was destined to be expanded into a German world commercial association, a plan prevented by the outbreak of the World War. In 1907 Stresemann had been elected to the Reichstag as member of the National Liberal party, where he often spoke for his party on questions of public economy and foreign policy, and enjoyed increasing respect. He soon became a member of the central executive of the party, and Bassermann, recognising his great talent as an organiser and speaker, trained him, so to speak, as his successor. During the War Stresemann pursued a vigorous Nationalist policy, and was one of those who brought about Bethmann Hollweg's fall. After the collapse he founded the German People's party (*Deutsche Volkspartei*), becoming its president, having been, after Bassermann's death, president of the National Liberal party.

The German People's party, led by Stresemann, played a decisive part in Germany's internal policy after the War. It was opposed to the Weimar Constitution; on principle it remained long in opposition to the Governments of the Left. When the Ruhr conflict reached its climax, Stresemann published a series of articles which attracted much attention, urging a radical change in German policy; after the fall of Cuno's Cabinet, in Germany's darkest hour, he became Chancellor of the Reich with a Ministry of the so-called "great coalition," including all parties from the Social Democrats to the German People's party. As Chancellor, he wound up the Ruhr conflict. After a bare two months the Social Democrats abandoned him because he had had to take strong measures in the name of the Reich against the manifestations of Bolshevism in Saxony and Thuringia. He formed, however, a second Cabinet, which lasted till the end of Nov. 1923.

In Marx's Cabinet, which followed his own, Stresemann became Foreign Minister. His was the guiding influence on the foreign policy of this cabinet. He was largely instrumental in bringing about the acceptance of the Dawes plan by Germany and the Conference of London in Aug. 1924. After Marx's resignation he refused to form a new Cabinet, and used his influence to get the German Nationalist party included in the Government. He felt the valuable economic forces of this great party should not be condemned to eternal fruitless opposition. He himself remained Foreign Minister in Luther's first and second Cabinets.

During the long governmental crisis he sent the famous Feb. memorandum of 1925 to the Entente, which laid the foundations of the Pact of Locarno. Throughout 1925 this policy initiated by Stresemann was the focus of interest, not merely of Germany, but of the whole world. The conference of Locarno brought success. On Dec. 1. 1925 the Pact of Locarno was solemnly signed in London.

A man with many bitter enemies as well as sincere admirers, it must be agreed that Stresemann carried out a consistent policy without regard to party hostility. He can thus claim the merit for having freed the Ruhr district and the first Rhineland zone from foreign military occupation, for having laid the political foundations for the stabilisation of the currency and for having brought about less strained political relations between Germany and the outer world. One of the best speakers in Germany, he also possesses great political ability and practical

common sense. He wrote on the Pact of Locarno for this *Encyclopædia*. (F. KLE.)

**STREUVELS, STYN** (1871— ), pen name of Frank Lateur, Flemish writer, was the nephew of the priest-poet Guido Gerelle. For a long time he worked as a pastry cook at Avelghem in Flanders and then settled down at Ingoyghen, close by, in order to devote himself entirely to literature. Essentially a man of the soil, he nevertheless possessed a delicate artistic sensibility and acquired considerable literary culture. He is the most popular contemporary writer in Flanders and enjoys a great reputation throughout Holland, although he frequently introduces the Western Flemish dialect into his writings. Many of his novels have been translated into German. His descriptions of the countryside, no less realistic than poetical, are presented with enormous vigour and pungency in a style which seems to echo the rhythms of nature herself. *De Vlaschaard* (1907) is considered his best work.

**STRIKES AND LOCKOUTS** (see 25.1024).—The period under review has been characterised in all industrialised countries by an endemic condition of industrial warfare. Despite all the machinery of conciliation and the immense amount of both voluntary and legislative effort to secure the peaceful and equitable settlement of disputes between employers and workers, the organic development of the economic system is continually being interrupted by trials of strength which bring widespread distress both to those directly involved and to the rest of the community. The following article is confined to a statistical statement and description of the principal strikes and lockouts which have occurred between 1907 and 1924. For a discussion of the broader questions involved see INDUSTRIAL RELATIONS and TRADE UNIONS.

### I. GREAT BRITAIN AND NORTHERN IRELAND

The following table brings together the general totals for the strikes and lockouts which have occurred in each year under review in Great Britain and Northern Ireland.<sup>1</sup>

| Year | Number of disputes beginning in year | Total number of workpeople involved | Aggregate duration in working days of all disputes in progress during the year |
|------|--------------------------------------|-------------------------------------|--------------------------------------------------------------------------------|
| 1907 | 585                                  | 146,000                             | 2,150,000                                                                      |
| 1908 | 389                                  | 293,000                             | 10,790,000                                                                     |
| 1909 | 422                                  | 297,000                             | 2,690,000                                                                      |
| 1910 | 521                                  | 514,000                             | 9,870,000                                                                      |
| 1911 | 872                                  | 952,000                             | 10,160,000                                                                     |
| 1912 | 834                                  | 1,462,000                           | 40,890,000                                                                     |
| 1913 | 1,459                                | 664,000                             | 9,800,000                                                                      |
| 1914 | 972                                  | 447,000                             | 9,880,000                                                                      |
| 1915 | 672                                  | 448,000                             | 2,950,000                                                                      |
| 1916 | 532                                  | 276,000                             | 2,450,000                                                                      |
| 1917 | 730                                  | 872,000                             | 5,650,000                                                                      |
| 1918 | 1,165                                | 1,116,000                           | 5,880,000                                                                      |
| 1919 | 1,352                                | 2,591,000                           | 34,970,000                                                                     |
| 1920 | 1,607                                | 1,932,000                           | 26,570,000                                                                     |
| 1921 | 763                                  | 1,801,000                           | 85,870,000                                                                     |
| 1922 | 576                                  | 552,000                             | 19,850,000                                                                     |
| 1923 | 628                                  | 405,000                             | 10,670,000                                                                     |
| 1924 | 709                                  | 612,000                             | 8,320,000                                                                      |

The great majority of the disputes were relatively unimportant; roughly 90% of all the disputes involved less than 1,000 workpeople, and only about 2% involved more than 5,000.

<sup>1</sup> The exclusion of the area now forming the Irish Free State does not materially affect the figures except in 1913, when a "general strike" occurred at Dublin, i.e., a strike aimed at dislocating the whole of the trades of a city or territory—the only instance before the General Strike of 1926 of such a strike on a considerable scale in the British Isles. The strike (which was unsuccessful) involved about 20,000 workpeople, and included, at the time of its maximum extension, tramwaymen and other transport workers, and the employees of flour-millers, coach-builders, biscuit-manufacturers, coal-merchants, steamship companies, master builders and several other trades, including even farmers in County Dublin.

These latter disputes, however, though so few in number, accounted for five-sixths of the time lost by all the disputes, and it is mainly these large disputes which account for the variations between the figures for the different years in the last column of the table.

The low totals for the War years 1914-8 contrast with the high figures for the three years immediately after the War, viz.: 1919-21. Since then the amount of industrial disturbance due to disputes has diminished very substantially. The loss of time through disputes, in all but five of the years included in the table amounted to the equivalent of *less than one day in the year*, if spread over the entire working population; that is to say, to less than the effect of a single public holiday, an almost insignificant loss by comparison (for example) with the loss through sickness or through involuntary unemployment.

The statistics relating to the causes or objects of disputes show that wages questions account for about two-thirds of the total number of strikes and lockouts. In years of good or improving trade, such disputes largely arise out of demands for advances in wages; and it is worth noting, in this connection, that no important disputes arising out of resistance to a reduction in wages occurred between 1908 and the end of 1920. Disputes arising out of questions of hours of labour were unusually frequent in 1919, when the movement towards shorter hours was at its height: 10% of all the disputes of that year were due to questions of hours. In other years the proportion averages less than 3% of the total number. Disputes arising on questions of particular classes or persons (e.g., demarcation disputes; strikes for the removal of an unpopular foreman or for the reinstatement of a dismissed fellow-worker) account for about 15%; and other disputes (largely concerned with questions of trade union principle) for a similar proportion of the total.

Of all the disputes, about 25% ended definitely in favour of the workpeople, about 30% in favour of the employers, and about 45% were compromised. Even this large figure, however, does not fully represent the predominance of compromised settlements, because the tendency to settlement by compromise is greatest in the case of the larger disputes; hence of all the workpeople directly involved in strikes and lockouts about 65% resumed work after a compromised result, while about 20% resumed after a settlement definitely in their favour and about 15% sustained defeat.

The great majority of the disputes—between two-thirds and three-quarters of the total—were settled by direct negotiation between the parties or their representatives, and one-half of the remainder by conciliation or by arbitration. Other methods by which strikes and lockouts have been terminated in recent years have included unconditional surrender of the workpeople, the closing of works and the replacement of workpeople. During the War years a number of disputes were terminated by administrative decisions of the Government. One of the greatest disputes, viz.: that in the coal-mining industry in 1912, was settled by the enactment of the Coal Mines (Minimum Wage) Act. Particulars of industrial disputes in Great Britain will be found in the official *Abstract of Labour Statistics* and in the monthly *Ministry of Labour Gazette*; the issue of the *Labour Gazette* for July 1925, contains a review of the disputes of the 15 years 1910-24, and that for Jan. of each year, which contains a review of the disputes of the previous year.

*Principal Disputes in the United Kingdom.*—It has already been pointed out that a very small minority of the disputes account for by far the greater number of workpeople involved and of days lost; two or three big disputes, indeed, commonly account for an altogether disproportionate share of the days lost in any year. The most remarkable example of this occurred in 1921, as will be seen from the following figures:—

|                                   | Workpeople involved | Man-days lost |
|-----------------------------------|---------------------|---------------|
| One coal-mining dispute . . . . . | 1,150,000           | 72,000,000    |
| One cotton dispute . . . . .      | 375,000             | 6,750,000     |
| 761 other disputes . . . . .      | 276,000             | 7,120,000     |
| Total . . . . .                   | 1,801,000           | 85,870,000    |

On the other hand, in some years there were no disputes of outstanding importance; the years 1907 and 1909 are examples, though it will be observed that both these years had more industrial disturbance, so far as mere number of disputes goes, than the intervening year, 1908.

Brief comments are appended on some important disputes.

The cotton strike of 1908 is memorable as having been, with two other disputes of the same year, the last important dispute, for the

long space of 12 years, arising out of resistance to a reduction in wages in that trade.

The seamen's and transport workers' strike in 1911 began with the seamen striking in support of a demand for a conciliation board. Dock labourers and other transport workers joined in the strike, partly in sympathy with the seamen and partly in support of their own demands for improved conditions. There was a good deal of dissatisfaction with the working of the agreements reached in settlement of these disputes, and further strikes occurred in the following year, particularly on the Thames and Medway. The railwaymen in 1911 struck for an improvement in the Railway Conciliation Board scheme, which had been set up in 1907. The cotton dispute of 1911-2 began with strikes of weavers in Lancashire against the employment of non-unionists, to which the employers replied by a general lockout.

The coal strike of 1912 arose out of a demand by the Miners' Federation for the payment of an individual district minimum wage for all underground workers in mines, irrespective of the question whether the men's working places were abnormal or not. The dispute was settled by the passing of the Coal Mines (Minimum Wage) Act 1912, which provided for the setting up of joint district boards to determine the minimum rates of wages of underground workers in coal-mines.

The World War, as will be seen, by no means put an end to strikes; but most of them were small, and were speedily brought to an end. Hence the aggregate duration was brought down to a very low point in 1915 and 1916. There were, however, several unauthorised strikes in the engineering and munition trades in 1917, which caused great concern at the time, though only one was of very serious importance as measured by aggregate duration. It was in these disputes that "shop stewards" (sometimes acting in defiance of their own trade-union executives) first came prominently into public notice.

There were many industrial disputes in 1918, but the great majority involved small numbers and were of short duration. In 1919 and 1920, on the other hand, there were many serious disputes. A great railway strike occurred in Sept. and Oct. 1919, the National Union of Railwaymen being dissatisfied with the new standard rates proposed for certain grades. There was also a prolonged ironmoulders' strike, which lasted for four months, and seriously dislocated the engineering industry. In the same year there was a great strike in the cotton trade, both the spinning and the weaving branches being affected. The operatives asked for a reduction in hours and an advance of 30% on list prices. The advance was granted, and the hours reduced to 48 per week (instead of 46½, as asked). The principal dispute of 1920 and again of 1921 was a national strike in the coal-mining industry (see COAL).

The cotton dispute of 1921 arose out of a demand of the employers for a reduction of 95% on the standard lists of wages (equivalent to about 30% on the rates then actually being paid). This was reduced to 80% during the subsequent negotiations. The dispute was finally settled by the operatives accepting a reduction of 70% (60% at once, and another 10% after six months).

The engineering dispute of 1922 arose out of the rejection by the members of the Amalgamated Engineering Union, on a ballot vote, of a provisional agreement on overtime and the exercise of managerial functions which had been reached between the executive of the Union and the Engineering and the National Employers' Federations in Nov. 1921. The members of the Union were, therefore, locked out on March 11; and members of other unions employed in federated engineering shops were also locked out on the following May 2. On May 17 the employers put forward new proposals, embodying the principle of prior consultation with the workpeople when a proposed change involved the displacement of one class of workpeople by another. These terms were eventually accepted by all the unions concerned, and work was resumed at various dates in June. The shipbuilding dispute of the same year arose out of a proposed reduction of wages; a modified reduction was accepted after a stoppage of six weeks.

The shipbuilding dispute of 1923 was confined to the United Society of Boilermakers and Iron and Steel Shipbuilders, which refused to accept an agreement with the Shipbuilding Employers' Federation relating to overtime and night-shift working, which had been signed by the other shipyard unions. The lockout was settled, after a stoppage of nearly seven months, by the federation agreeing to reconsider, in consultation with the Boilermakers' Society, five points which were alleged to need correction or adjustment in their application to the members of the society.

## THE GENERAL STRIKE OF 1926

The great coal dispute of 1921 was terminated (see COAL) by the signing of an agreement between the miners and the mine-owners, providing for the automatic regulation of wages from one period to another on the basis of the ascertained costs of production, proceeds, etc., in an earlier period. In Jan. 1924 the Miners' Federation gave three months' notice to the Mining Association to terminate the agreement of 1921. In June 1924, after prolonged negotiations, a new agreement was made, which

was, in the main, much more favourable to the men than the agreement of 1921, though it contained some provisions intended to benefit the owners. *See* Coal.

Unfortunately, not long after the new agreement came into force the industry entered upon a period of very severe depression; and the agreement, therefore, with its improved terms to the miners, proved extremely onerous to the owners. On June 30 1925 the owners gave the miners one month's notice to terminate the agreement; and on the following day they communicated to the miners their proposals for a new agreement, which were rejected by a delegate conference of the Miners' Federation. On July 30 the Prime Minister offered financial assistance to the industry until April 30 1926, to allow time for a full investigation to be made; and on the following day (the day when the owners' notices to the men would otherwise have expired) the terms were accepted, and arrangements were made for work to be continued. The total cost of the subvention, from the beginning of Aug. 1925 to the end of April 1926, was £24,000,000.

*The Samuel Report.*—On Sept. 5 1925 a royal commission was appointed, under the chairmanship of Sir Herbert Samuel, "to enquire into and report upon the economic position of the coal industry and the conditions affecting it, and to make any recommendation for the improvement thereof." The royal commission issued its report on March 6 1926, suggesting a number of measures that might be taken for the improvement of the industry, but also expressing the opinion that an immediate reduction of working costs, by means of a revision downwards of the minimum percentage addition to standard rates of wages, was essential, as a temporary measure, to save the industry. They considered it essential that, though national wage agreements should continue, there should nevertheless be, as hitherto, considerable variation in the rates of wages in the several districts, and laid it down that, "before any sacrifices are asked from those engaged in the industry, it shall be definitely agreed between them that all practicable means for improving its organisation and increasing its efficiency should be adopted."

The report was accepted by the Government in its entirety, but only subject to acceptance by the other two parties. The owners issued a statement expressing general agreement with the report; but they at first desired to initiate negotiations with the miners on district lines. Later, under pressure from the Government, they withdrew from this position; but the best terms which they were able to offer represented a severe reduction of wages in most districts; and, owing to the delay already mentioned, these terms were not presented to the miners, nationally, until the owners' notices were on the point of expiring. The miners were strongly averse to any reduction of wages or any increase of hours; they also wanted assurances that were not forthcoming as to the measures of reorganisation mentioned in the paragraph quoted textually above. No settlement was found possible; and the owners' notices, which they had issued in anticipation of the termination of the subsidy period on April 30, took effect on that date.

*A General Strike Called.*—Meanwhile, the general council of the Trades Union Congress, who had already come to the assistance of the miners in July 1925—the Miners' Federation had "placed their case unreservedly in the hands of the general council" at that time—again intervened; and prolonged negotiations followed. On May 1 1926, with a view to assisting the miners, the general council issued instructions calling out on strike the railway and transport workers, the printing and paper trade unions, some branches of the metal and engineering and of the building trade workers, and some other classes; and it was intimated that other classes of workers would be called out later, if necessary. This was the first example of a general strike in Great Britain, though there had been a strike of this kind in Dublin in 1913, involving about 20,000 workpeople.

The stoppage on the railways and at the docks, of tramway and omnibus services, and of printing, was at first nearly complete; though there was some recovery as the strike went on. Volunteers, and men who had refused to come out or had gone

back to work, maintained or restored a skeleton service on the railways and omnibus routes, and on some of the provincial tramways; some work was also done by volunteers at the docks. Apart from this, the Government were able to introduce an emergency service of motor transport, sufficient to ensure a supply of necessary foodstuffs; and many thousands of volunteers offered themselves for work in all sorts of capacities, and as special constables. Strict orders were issued by the Trade Unions to their members to refrain from provocation, and cases of serious disorder or violence were rare.

The success of these measures, together with a judgment given by Mr. Justice Astbury declaring the general strike to be illegal and not covered by the protection of the Trade Disputes Act, and pronouncements in the House of Commons to the same effect, no doubt hastened the termination of the strike. The general council had also been in touch with Sir Herbert Samuel, who had been acting, unofficially, as a mediator, and had agreed with him on a formula which, it was hoped, would enable negotiations to be resumed. In this hope the general council informed the Prime Minister on May 12 that they had decided to call off the strike unconditionally. Sir Herbert Samuel's formula was not, however, accepted by the miners; nor was it adopted by the Government, who, on the termination of the general strike, immediately resumed negotiations with the miners.

Some difficulties arose in connection with the resumption of work after the general strike. The most important source of dislocation, at least on the railways, arose from the fact that, partly owing to the lack of coal traffic and the necessity of economising coal, a great reduction in the railway services was in any case inevitable, and it was, therefore, impossible to re-employ immediately all those who had gone on strike. On May 14, however, the railway companies came to an agreement with the three railway trade unions, on the basis of undertaking to take back the men as work could be found for them; the trade unions also acknowledged that they had been guilty of a "wrongful act" in bringing their members out on strike without the usual notice. Similar agreements were made with the other trade unions. The strike of the miners, however, still continued.

## II. FOREIGN COUNTRIES

A brief account is given below of strikes and lockouts in the years after the War in the principal European countries, other than Great Britain, from the official statistics available at the beginning of 1926:—

*Belgium.*—The average annual number of labour disputes in the post-War years (1920–4) in Belgium was 261, directly affecting an average of 145,105 workers. Particulars are not available as to the number of working days lost. There were no features of particular interest in connection with the disputes; 1920 was the year most affected (517 disputes directly affecting 296,192 workers).

*France.*—The latest figures available for France are for 1922. For the four post-War years the figures are as follows:—

| Year                        | Number of disputes | Number of workpeople directly affected | Aggregate duration in working days |
|-----------------------------|--------------------|----------------------------------------|------------------------------------|
| 1919 . . . . .              | 2,053              | 1,206,175                              | 16,128,638                         |
| 1920 <sup>1</sup> . . . . . | 1,924              | 1,487,996                              | 24,563,527                         |
| 1921 . . . . .              | 576                | 453,564                                | 8,092,388                          |
| 1922 . . . . .              | 711                | 307,056                                | 3,385,902                          |

<sup>1</sup> Figures for 1920 and subsequent years include Alsace-Lorraine.

A noticeable feature in France has been the tendency to strike among employees of public bodies.

*Germany.*—During the post-War years (1919–23) the average annual number of disputes in Germany was 3,762, which directly affected 1,657,469 workers and involved a loss of 23,158,100 working days on the average. The years 1919, 1921 and 1922 were the most serious. It should be noted that political motives were the cause of many German strikes in those years, e.g., the Kapp Putsch and the occupation of the Ruhr.

*The Netherlands.*—The average annual number of strikes in the post-War years (1919-24) in the Netherlands was 380, which directly affected 50,567 workpeople and involved a loss of 1,687,983 working days on the average. In the year 1923 a dispute occurred in the textile industry, which affected 22,200 workpeople and caused the loss of 3,119,100 working days. The last figure is greater than the total loss in any other of the six years in all industries.

*Scandinavian Countries.*—Widespread disputes in the spring of the year, when most collective agreements terminate, are a marked feature in the Scandinavian countries: in Denmark, for example, in the spring of 1925 an almost general dispute (strikes and lockouts) directly affected 95,000 workpeople and involved a loss of 4,021,900 working days.

The average annual number of strikes, workers affected and days lost in these countries in the post-War years was as follows:—

| Country and years | Number of disputes | Number of workpeople directly affected | Aggregate duration in working days |
|-------------------|--------------------|----------------------------------------|------------------------------------|
| Denmark, 1919-24  | 164                | 27,748                                 | 892,609                            |
| Norway, 1921-4    | 58                 | 61,168                                 | 2,405,946                          |
| Sweden, 1919-24   | 355                | 78,724                                 | 4,114,706                          |

A great lockout (Feb. 14 to May 27 1924) in Norway affected 39,476 workpeople and involved a loss of 2,962,263 working days. Compulsory arbitration was in force in Norway from 1916-21, when the Act was allowed to lapse. It was renewed in 1922 for a year, but an attempt to renew it in 1923 failed. In Sweden the peak year of the period was 1920, when 486 disputes occurred directly affecting 139,039 workpeople and causing a loss of 8,942,543 working days.

*Spain.*—The average annual number of disputes in the post-War years (1919-23) in Spain was 380, which directly affected 149,371 workers and involved the loss of 3,952,986 working days on an average.

## III. BRITISH DOMINIONS

*Canada.*—The average annual number of disputes in the post-War years (1919-24) was 163, which directly or indirectly affected 52,580 workpeople and involved a loss of 1,716,577 working days on an average. The year 1919 alone accounted for more than one-third of the total number of working days lost.

*Australia.*—The average annual number of disputes in the post-War years (1919-24) in Australia was 477, which directly and indirectly affected 137,226 workpeople, and caused a loss of 2,010,036 working days on an average. The year 1919 alone accounted for rather more than half the total number of working days lost (6,308,226 out of 12,060,216).

*South Africa.*—The average annual number of disputes in the post-War years (1919-23) was 30, which covered 33,680<sup>1</sup> workers and involved a loss of 565,832 working days on an average. The year 1923 was distinguished by having only two strikes affecting 50 workers and involving the loss of 740 working days.

## IV. THE UNITED STATES

The distinction, for statistical purposes, between a strike and a lockout is often difficult to make and therefore, when figures for several years are presented, strikes and lockouts are grouped as "industrial disputes." Table I. sets forth the number of strikes and lockouts and the number of workers involved, during the period 1914-24.

TABLE I.

Number of Industrial Disputes and Number of Employees Affected 1914-24

| Year | Disputes | Employees Involved |
|------|----------|--------------------|
| 1914 | 1,204    | ..                 |
| 1915 | 1,500    | ..                 |
| 1916 | 2,667    | 1,599,917          |
| 1917 | 2,325    | 1,227,254          |
| 1918 | 2,151    | 1,239,989          |
| 1919 | 2,665    | 4,160,348          |
| 1920 | 2,226    | 1,463,954          |
| 1921 | 1,785    | 1,099,247          |
| 1922 | 865      | 1,608,321          |
| 1923 | 1,132    | 744,948            |
| 1924 | 872      | 654,453            |

Compiled from the Bureau of Labour Statistics, Monthly Labour Review.

The distribution of these disputes among the several more important industries of the United States is illustrated by Table II.:

TABLE II.

Number of Disputes in the More Important Industries 1914-24

| Industry       | Number of Disputes |      |      |      |      |      |      |      |      |      |      |  |  |
|----------------|--------------------|------|------|------|------|------|------|------|------|------|------|--|--|
|                | 1914               | 1915 | 1916 | 1917 | 1918 | 1919 | 1920 | 1921 | 1922 | 1923 | 1924 |  |  |
| Building       | 275                | 231  | 394  | 468  | 434  | 473  | 521  | 583  | 113  | 206  | 267  |  |  |
| Clothing       | 78                 | 139  | 227  | 495  | 430  | 322  | 336  | 240  | 215  | 357  | 223  |  |  |
| Furniture      | 18                 | 20   | 50   | 43   | 26   | 35   | 26   | 17   | 4    | 12   | 34   |  |  |
| Iron and Steel | 14                 | 30   | 72   | 56   | 74   | 76   | 25   | 25   | 10   | 10   | 7    |  |  |
| Leather        | ..                 | ..   | 34   | 19   | 16   | 27   | 32   | 26   | 17   | 17   | 5    |  |  |
